ADVERTISEMENT.

THE Geography of M. Malte-Brun has long been acknowledged as the most complete work of its kind. It not only acquired a high reputation in the original French, but when translated into English was admitted by the best critics to be superior to any English work. Its completeness and general arrangement have been highly commended; but it is the execution of the work, the animated and attractive style in which it is written, that makes it especially worthy of praise. It is not a dry treatise, but so abounds in interesting description and lively statement even of philosophical views, that it enlists the attention as closely and pleasantly as works of simply an entertaining character, while it is none the less a thorough and scientific work.

The first American edition was issued under the supervision of James G. Percival, who was distinguished for his literary and scientific attainments. He revised the translation with care, corrected errors, and added numerous notes to explain or modify the text, or further to illustrate the subject. His notes on the geological portions of the work are especially full and important.

That edition has for some years been out of print, and the demand for the work, from time to time, among those who know its value, has induced the publisher to issue a new and superior edition, beautifully illustrated, and containing much additional matter, designed to adapt it to the present state of the science, and to the taste and wants of the American public.

The additions will be found in an Appendix, and embrace recent EXPLORATIONS and DISCOVERIES, including those of DR. KANE and THE LATE ENGLISH ARCTIC EXPEDITIONS; new facts in PHYSICAL GEOGRAPHY developed by late researches; changes in POLITICAL GEOGRAPHY; statistics of POPULATION, AGRICULTURE, COMMERCE, MANUFACTURES, MINERAL PRODUCTS, etc. They are compiled chiefly from the late French edition of Malte-Brun, edited by M. Huot, an accurate and learned writer, and the still later edition of M. Theophile Lavallée, who is highly esteemed as a scholar, and the author of a History of France. The statistics are taken from the most reliable authorities.

The work contains a series of finely colored maps, and is illustrated with numerous engravings on steel, embracing views of the principal cities of the world, places celebrated in history, and remarkable scenery. The illustrations are executed in the highest style of the art, and render the work one of the most beautiful, as it is one of the most useful, works ever published in this country.

2 Nov 26 App. vol. done - vs. of S

NOTE.

THE Appendix will be found arranged in the same order as the body of the work. To avoid a multiplication of notes, no special reference is made on the pages of the text to the Appendix, but all additions, corrections, and changes may be found by turning to the corresponding "Book" in the Appendix.

CONTENTS OF VOL. III.

BOOK CXXII.

EUROPE CONTINUED.

Germany.—Sixth Section.—Kingdom of Wirtemberg.—Grand Duchy of Baden.—Principalities of Hohenzollern-Hechingen, Hohenzollern-Sigmaringen and Lichtenstein.

Present and Former Divisions compared,	1
KINGDOM OF WIRTEMBERG—Geology—Climate,	1
Fossil Bones—Lakes—Ancient Inhabitants,	1
House of Wirtemberg—Productions—Game—Manufactures—Spirits,	2
Commerce—Inland Trade,	2
Revenue—Expenditure—Emigration—Aurora Borealis,	2
Army,	3
Population—Privilege of bearing Fire-arms—Liberty of the Press,	3
Education,	3
Orders of Knighthood—Constitution,	4
Religious Liberty—General Assembly—Conservative Council, Divisions of the Kingdom—Towns—Stuttgard,	4
Ludwigsburg—Ellwangen,	4
Hohenstaufen—Reutlingen—Tubingen, University—Ulm,	5
Biberach—Antiquities—Crimes,	5
GRAND DUTCHY OF BADEN,	5
Extent and Surface—Mountains—Geological Formation—Lakes and Ponds,	6
Climate—Forests,	6
Natural Productions—Mines—Agricultural Produce—Manufactures,	6
Commerce—House of Baden, its Antiquity—Population,	7
Religion,	7
Government—Conscription—Code—Weights and Measures,	7
Ranks—Education,	8
Crimes—Finances—Army—Political Divisions,	8
Language—Towns—Manheim,	8
Population—Heidelberg, University,	9
Castle—Famous Tun—Other Towns—Carlsruhe,	9
Supposed Origin of Pforzheim,	9
Roman Town—Rastadt—Baden—Marshal Turenne—Offenburg—Friburg—Brisach,	10
Southern District—Willingen—Constance,	10
Martyrdom of Huss and Jerome of Prague,	10
Administration—Freedom of Trade,	10
PRINCIPALITIES OF HOHENZOLLERN—Hohenzollern-Hechingen,	11
Hechingen—Hohenzollern-Sigmaringen—Town of Sigmaringen,	11
Town of LICHTENSTEIN,	11
PRINCIPALITY,	11

BOOK CXXIII.

EUROPE CONTINUED.

Germany.—Seventh Section.—Kingdom of Bavaria.

Political Limits—Basins,	12
Mountains—The Spessart—Rocks,	12
The Rhæne-Gebirge—The Fichtel-Gebirge—The Bœhmerwald—Length,	13
Formations on the North and South of the Danube,	13
Fossil Bones—Lakes,	13
Mineral Springs—Climate—Ancient Inhabitants,	13, 14
Hermunduri—Narisci—Vindelici,	14
Roman Colonies—Bavaria during the Middle Ages—Chiefs or Dukes,	14
Thassilo—The Country divided into Counties by Charlemagne—Luitpold, the First Margrave,	14
Soil—Agriculture,	15
Domestic Animals—Oxen—Hogs—Horses—Sheep,	15
Bees,	15
Horticulture—Wines—Woods and Forests,	16
Quarries and Mines—Iron,	16
Manufactures—Commerce,	16, 17
Corn Trade—Population,	17
Religion—Inhabitants,	17
Education—Constitution,	17
General Assembly of Two Chambers,	18
Orders of Knighthood—Army—Finances,	18
Political Divisions—Circle of the Isar—Munich,	18
Royal Palace—Public Collections,	19

BOOK CXLVII.

EUROPE CONTINUED.

Description of the Scandinavian Peninsula.—First Section.—Kingdom of Norway.

Language of the Scalds—Scandinavian Poems, 356
 Creation of the World and of Man—The Olympus of the North, 356
 Destruction of the Universe, 357
 Resurrection of the World—Origin of this Cosmogony—Runic Alphabet—Origin of the Scandinavians, 357
 Ancient Names, 358
 Ancient Inhabitants—Ancient Manners, 358
 Ancient Names of Norway—Historical Notices, 359
 Government, &c., 359

Present State of Norway,	360
Summer Occupations—Winter Occupations,	360
Character of the Norwegians—Dress—Manners of the Towns,	360, 361
Mountains—Rivers,	361
Geological Constitution,	362
Mineral Wealth—Vegetation,	362
Animal Kingdom,	363
Climate,	363
General Appearance—Cities and Towns—Hammerfest—Tromsøe,	363, 364
Drontheim—Bergen,	364
Christiansand—Arendal,	365
Frederikstad—Kongsberg—Christiania,	365
Frederikshald—Norwegian Archipelago,	365, 366
Industry in Norway,	366

BOOK CXLVIII.

EUROPE CONTINUED.

Description of the Scandinavian Peninsula.—Second Section.—Description of Sweden.

Laplanders,	367
Westro-Bothnia—Jemtia or Jemtland—Helsingia—Nericia—Dalecarlia—Gothia or Gothland—Rivers,	367, 368
Lakes—Canals,	368
Roads—Islands—Eland—Gothland—Hven—Geology,	368
Rocks and Veins—Diluvium,	369
Animals—Vegetation,	369
Agriculture—Climate,	370
Seasons—Cities and Towns—Lulea,	370
Umea—Manners of the Laplanders—Manners of the Northern Swedes,	370
Hernæsand—Gefle—Fahlun—Manners of the Dalecarlians—Manners of the Helsingians,	370, 371
Upsal—University,	371
Cathedral—Curiosities in the Cathedral,	371
Stockholm—Surrounding Country—Suburbs—Harbour,	372
Royal Palace,	372
Squares—Churches—Cathedral,	372, 373
Useful Institutions—Environs—Erebro—Carlstad,	373
Linköping—Jönköping—Gottenburg,	374
Uddevalla—Halmstad—Lund—Malmö—Christianstad,	374
Carlsrona—Calmar—Union of Calmar,	374, 375
Wisby—Manners of Southern Sweden—Fêtes and Amusements,	375
Education—Police—Taxes,	375
Navy—Laws—Government—Senate,	375, 376
Council of State—States-General—Industry and Trade,	376
Ameliorations,	377

Statistical Tables of the Swedish Monarchy, 378—380

BOOK CXLIX.

EUROPE CONTINUED.

Description of Denmark and of the Færoe Isles.

Limits of Denmark,	381
Diminution of the Baltic Sea,	381
Geology—Fossil Vegetables,	381, 382
Fiords—Lakes,	382
Canals,	382
Dimensions of Denmark—Climate—Seasons—Vegetation—Forests,	383
Meadows—Cultivation,	383
Wild Animals—Domestic Animals,	384
Fish—Commerce,	384
Language—Danish Character	384, 385

Inhabitants of Holstein—Education,	385
Learned Men,	385
Artists—Government,	386
Revolution of 1660,	387
Establishment of Absolute Power,	388
Present Form of Government,	388
Orders—Privileges of some Provinces—Liberation of the Peasantry,	388, 389
Aspect of the Danish Coasts—Sound Duties—Zealand—Copenhagen	389
Disasters of Copenhagen—Its Quarters,	389
Literary Establishments—Industry and Trade,	390
Police—Environs of Copenhagen—Elseneur,	390
Islands—Bornholm—Mœen—Funen—Langeland—Laaland—North Jutland—Aalborg—Viborg—South Jutland,	390, 391
Sleswick—Flensburg,	391
Islands on the Western Coast—Islands on the Eastern Coast—Dutchy of Holstein,	392
Gluckstadt—Kiel—University,	392
Rendsburg—Preetz—Probsty of Preetz,	393
Ploen—Itzehoe,	393
De Brut-Kamp—Obelisk—Elmshorn—Pinneberg,	393, 394
Altona—Destruction in 1713,	394
Dutchy of Lauenburg—Ratzeburg—Lauenburg,	395
Færoe Islands—Thorshavn,	395, 396

Statistical Tables of the Danish Monarchy, 397

BOOK CL.

EUROPE CONTINUED.

Belgium, or the Netherlands.

History and Inhabitants,	398
Government of the Late Kingdom of the Netherlands,	398, 399
Recent Changes,	399
Mountains—Rivers,	400
Lakes and Marshes—Geological Constitution,	400, 401
Configuration of the Surface in Belgium—Minerals,	401
Climate and Cultivation,	401, 402
Manufactures—Iron, &c.—Woollen—Linen—Lace—Cotton,	402
Breweries, &c.—Foreign Trade—Roads and Canals,	402
Religion—Cities—Antwerp—Cathedral,	403
Malines—East Flanders—Ghent,	404
Alost—Oudenarde—West Flanders—Bruges,	404, 405
Ostend—Ypres,	405
Courtray—Fields of Battle,	405
Fontenoy—Fleurus—Steenkerke—Jemappe—Tournay,	406
Tomb of Childeric I.—Mons,	406
Dinant—Namur,	407
Nivelles—Waterloo—Brussels,	407
Squares,	408
Churches—Fountains—Population of the Different Quarters of the City,	408
Scientific and Benevolent Establishments—Promenades,	408, 409
Louvain—University—Tirlemont,	409
Tongres—Maestricht—The Mosasaurus,	409
Maaseyk—Wert—Venloo,	410
Ruremonde—Limburg—Verviers—Spa—Liege—Grand-Dutchy of Luxemburg,	410, 411
St. Hubert—Bouillon—Arlon—Luxemburg,	411

BOOK CLI.

EUROPE CONTINUED.

Holland, or the Seven United Provinces.

Glance at the History of Holland,	412
Government—Ancient Physical State,	412
Surface—Rivers,	413

Lakes—Marshes, 413
 Gulfs or Bays—Canals—Islands—Geology, 413, 414
 Climate and Cultivation—Language, 414
 Ancient Inhabitants—Territorial Divisions, 414, 415
 Cities—Groningen—University, 415
 Leeuwarden—Harlingen—Assen—Coevorden—Zwol, 416
 Campen—Deventer—Zutphen—Arnhem—Nimeguen, 417
 Utrecht—University, 417, 418
 Amersfoort—Islands in the Zuyderzee—Texel—Camperdown, 418
 Willems-Ord—Medenblik—Horn, 419
 Alkmaar—Saardam—Broek, 419
 Amsterdam—The Amstel, 420
 Streets, 420
 Public Buildings—The Stadthouse, 421
 Commerce and Industry, 421, 422
 Haarlem—Invention of Printing, 422
 Leyden—University, 423
 The Rhine at Leyden, 423
 The Hague—Public Buildings, 424
 Environs of the Hague, 424
 Delft—Rotterdam, 425
 Dordrecht or Dort, 426
 Middleburg—Flushing—Bergen op Zoom—Bois le Duc, 427
 Breda—Character of the Dutch, 427
 Manners of the Dutch, 428

Statistical Table of the Belgian Provinces, 429
Statistical Table of the Dutch Provinces, 429, 430
Dutch Colonies, 430
Statistical Tables connected with the Late Kingdom of the Netherlands, embracing both Dutch and Belgian Provinces, 430, 432

BOOK CLII.

EUROPE.

Europe Continued—Great Britain—England—First Section—Civil Geography—Early Inhabitants—Roman Conquests—Saxon Invasion—Normans—History, Progress and Settlement of the Constitution.

Early Inhabitants, 433
 Roman Invasion, B. C. 55, 433
 Intercourse with Gaul—Towns, Houses, &c.—Married State, 434
 Appearance—Method of Fighting, 434
 Money—Hospitality—Government, 434
 Power of the Priests—Effects of the Roman Conquest, 435
 Government of Agricola, 435
 Northern Tribes, Caledonians—Number of Tribes—Roman Provinces, 435
 Monuments of the Romans. Prætentura of Agricola—Vallum of Hadrian, 436
 Vallum of Antoninus, 436
 Wall of Severus, 436
 Britons under the Romans, 437
 British Soldiers in the Roman armies—Corn, Towns, &c.—States—Advances in Civilization, 437
 Scots and Picts—Saxons, Angles and Jutes, 438
 Saxon Conquest—Chorography—Kingdom of Kent—Kingdom of Sussex, 438
 Wessex—Essex—East Anglia—Bernicia, 438, 439
 Deira—Mercia—Octarchy—Divisions of the Country, 439
 Sheriffs—Accessions made in the Norman Period—Wales—Counties—Ridings—Lathes—Rapes—Hundreds and Tithings, 439
 Anglo-Saxon Language, Similitude to the English, 439
 Anglo-Saxon and English Words, 440
 Population during the Anglo-Saxon Period—Domesday Book, 440
 Barbarism of the Saxons—Arts, Trade, &c. 440
 Houses—Government, 441

Governments, 441
 Juries—Norman Conquest, 441
 Henry the Third—The Edwards, 442
 Wretched Condition of the People, 442
 Famine in the time of Edward the Second, 442
 Pestilence in 1349—Poll-Tax, 442, 443
 Parliaments, 443
 Parliament—Rise of the Towns, 443
 Elective Franchise extended by Henry the Eighth, 443
 House of Lords, 444
 Abuses abolished—Statute of Treasons—Architecture—Churches, 444
 Clocks—Woollen Manufactures, 444, 445
 Foreign Merchants—Richard the Second, 445
 Dependents of the Great—Deposition of Richard the Second, 445
 Period from the Accession of Henry the Fourth to the Accession of Henry the Seventh—Religious Persecution, Wealth of the Church—Power of the Commons, 445, 446

 Duration of Parliaments, 457
 Law of Treason—Liberty of the Press, 457
 Act of Settlement—Reports of Parliamentary Speeches, 457
 Settlement of the Constitution, 458
 Parties—Whigs and Tories, 459
 Religious Liberty, 459
 Resources of England—Commercial Resources, 459
 Inland Navigation, 460
 Roads—Piers, Moles, &c. 460

BOOK CLIII.

EUROPE.

Europe Continued—England and Wales—Second Section—Physical Geography—Extent—Climate—Coasts—Rivers—Mountains—Productions.

Superficial Extent, 462
 Trigonometrical Survey, 462
 Climate, 462
 Seasons—Spring, 463
 Summer—Autumn, 463
 Difference of the Climate in the North and the South, 464
 Quantity of Rain in Different Parts of England—Annual Rains in the Midland Counties, 464
 Counties in the North-West—Neighbourhood of London—General Results—Annual Quantity of Rain in England, 464

Temperature—Temperature of Liverpool—Temperature of Dover—Temperature of Lancaster—Temperature of London,	465	Animal Kingdom,	488
London and the West of England—Extremes of Cold and Heat—Winds,	465	Deer—Game—Bustard—Migratory Birds—Turtle Dove—Nightingale—Woodcock,	488
Prevalent Winds near London—Deviation at Liverpool,	465	Starling—Fish—Herring Fishery—Mackerel—Pilchards,	489
Coasts—Coast of Cumberland—Lancashire,	466	Oysters—Domestic Animals—Horse,	489
Estuary of the Ribble—Cheshire, North Wales,	466	Suffolk Horses—Black Cart Horse,	489
Menai Straits—Holyhead—Cardigan Bay,	466	Oxen—Devonshire Oxen, and Other Varieties,	490
Pembrokeshire Coast—Milford Haven—Bay of Swansea,	466, 467	Long and Short Horned Cattle—Sheep—Long Woolled Sheep,	490
Monmouthshire Coast—Bristol Channel,	467	Short Woolled—Number of Long and Short Woolled Sheep—Quantity of Wool,	490
Southern Coasts—Southern Coast of Cornwall,	467	Pigs,	490, 491
Eddystone Rock—Devonshire,	468		
Isle of Wight,	468		
Southampton Water—Spithead—Sussex—Kent,	468		
Downs—Goodwin Sands—Isle of Thanet,	469		
Essex,	469		
Suffolk,	469		
Lincolnshire,	470		
Yorkshire,	470		
Durham—Northumberland,	470, 471		
Resemblance between the British and the Opposite Shores on the Continent,	471		
Rivers—Thames,	471		
Feeders—Severn,	471, 472		
Rivers that communicate with the Washes,	472		
Humber—Trent,	472		
Feeders of the Trent,	473		
Streams flowing into the Humber from the North—Basins of the Principal Rivers—Basin of the Thames,	473		
Basin of the Severn—Bristol Channel,	473		
Basin of the Wash,	474		
Basin of the Humber—Basin of the Mersey,	474		
Lakes,	474		
Northern Lakes—Derwent Water,	475		
Bassenthwaite Water—Crummock Water—Buttermere,	475		
Winandermere—Mountains,	475		
Northern Range,	475, 476		
Malvern Hills—Cambrian Mountains,	476		
Cader Idris—Mountains in Devonshire,	476		
Plains, &c.—Wealds—Vale of York,	477		
Forests,	477		
Plants,	477		
Oaks,	478		
Soil,	478		
Geology—London Clay—Organic Remains,	478		
Wells—Chalk,	479		
Camden's Account of the Mole,	479		
Fossil Remains—Economic Purposes—Marles,	480		
Agricultural Character—Oolites,	480		
Position—Purbeck and Portland Stone—Great Oolite—Organic Remains,	480, 481		
Alum—Coal,	481		
Coal Districts in England,	481		
Great Northern District,	481		
Great Coal-Field of Northumberland and Durham—Quantity of Coal,	482		
Calculation by Dr. Thomson—Waste of Coal—Dangers to which the Miners are exposed,	482, 483		
History of the Northern Coal Trade,	483		
Number of Individuals employed in the Coal Trade,	484		
Other Coal-Fields—South Yorkshire, Nottinghamshire and Derbyshire Coal-Field—Manchester or South Lancashire Coal-Field,	484		
Whitehaven Coal-Field,	485		
Central District—Dudley, or South Staffordshire Coal-Field,	485		
North-Western District—Coal in Flintshire—Plain of Shrewsbury—Coalbrook-dale—Clee Hills,	485		
Billingsley—South-Western Division—Great Coal-Field of South Wales,	486		
Forest of Dean Coal—Somersetshire and Gloucestershire,	486		
Metals, Copper and Tin—Veins—Length and Depth of the Veins,	486		
Breadth of the Veins—Number of Mines—Management of the Mines—Ignorance of the Miners,	487		
Character of the Miners,	487		
Consequences of the Ignorance of Geology,	488

BOOK CXXII.

EUROPE.

Europe Continued.—Germany.—Sixth Section.—Kingdom of Wirtemberg.—Grand dutchy of Baden.—Principalities of Hohenzollern-Hechingen, Hohenzollern-Sigmaringen and Lichtenstein.

THE countries we are about to examine, are more extensive than the petty states which were last described,^a but they were not less subdivided, before Baden was erected into a grand dutchy, and Wirtemberg and Bavaria into kingdoms. The circle of Franconia comprehended the margraviates of Anspach and Bayreuth, as well as the free territory attached to the town of Nuremberg. The dutchy of Wirtemberg, the margraviate of Baden and the imperial towns of Ulm and Augsburg, made up the circle of Suabia. Lastly, the circle of Bavaria was formed by the electorate of Bavaria, the bishoprics of Salzburg, Passau and Freysingen, and the possessions of the free town of Ratisbon.^b

The changes in the territorial divisions in that part of Germany, as well as in other countries, were occasioned by the preponderance which France possessed in Europe, under the reign of Napoleon. In consequence of the treaty concluded at Presburg in 1805, the government of these ancient circles and free territories was changed; the small principalities of Lichtenstein and Hohenzollern retained their privileges, but Baden was raised into a grand dutchy, and Bavaria and Wirtemberg were made kingdoms, within the Germanic confederation. Some alterations in the limits of these states have been necessarily occasioned by the last treaties, and they have acquired, from their new organization, a greater influence than they possessed under the protection of France. Bavaria, which is still a powerful kingdom, holds, after Prussia, the first rank in the confederation. It shall be described in the next book.

The kingdom of Wirtemberg is situated between Bavaria and the grand dutchy of Baden. Roesch considers its greatest length to be equal to three hundred and forty-eight geographical miles; it is not less than five thousand eight hundred and twelve English square miles in superficial extent.^c The greater portion of it is covered with hills, or indented with vallies, the largest of which is watered by the Neckar. A branch of the Schwarz-Wald, or Black Forest,

forms for the distance of seventy miles,^d the western limit of the kingdom. The chain of the Schwarz-Wald, being composed of granite rocks, is consequently of a higher elevation^e than the Rauhe-Alb, another range, formed by limestone of secondary formation; the latter has been called the Suabian Alps by French geographers. These two chains are branches of a single range that commences at the banks of the Rhine, opposite Bale, and forms by its bifurcation the natural boundary of Wirtemberg on the south-west. The elevation of some of the principal mountains in Wirtemberg may be mentioned; the Katzenkopf or Cat's Head, is more than 3000 feet above the level of the sea;^f the Stornberg is 2776, the Rossberg 2689, the Hohenzollern 2621, the Kniebis 2565, the Teck 2327, the Stuienberg 2315, and the Neuffen 2263.^g The climate is in general mild and temperate, but on the heights and in the forests which extend along their declivities, the atmosphere is cold, and the winters are of longer duration. The rivers that rise from the mountains are the Neckar, together with the Enz, the Fils, the Rems, the Kocher and the Jaxt, all of which are feeders of the Neckar, and the Danube, together with several small rivers, such as the Riess, the Roth and the Iller.^h The fossil bones of elephants and other antediluvian animals have been discovered in the valley of the Neckar, in the neighbourhood of Canstadt. The Federsee is the largest lake in the interior of Wirtemberg; we shall not mention the lake of Constance, which forms merely the southern limit of the kingdom.

Ammianus Marcellinus^k and other ancient writers make mention of the Alemanni, who inhabited the country between the Upper Danube, the Upper Rhine and the Maine. That country forms, at present, the grand dutchy of Baden and the kingdom of Wirtemberg. The *Alemanni*, or the *Alamanni* or *Alambani*, as they are sometimes called by the ancients, were the ancestors of the people that now inhabit the states governed by the king of Wirtemberg. Agathias and Jornandes,^l who lived during the reign of the emperor Justinian, have left us much valuable information concerning these barbarous tribes. The first explains the meaning of their name, and tells us that Alemanni signifies a junction

^a The original states, that the countries which are now to be described occupy together a greater extent of surface than the small states which have been already enumerated. Two of these states (Wirtemberg and Bavaria) are larger than any in the preceding book, but Saxony is more extensive than Baden. The three principalities are among the smallest states in Germany.—P.

^b It is not true that the circles of Suabia and Bavaria were *made up of* or *formed by* the states above mentioned; but only that those states were among the most important comprehended in the circles. The great number of immediate small states, scattered over every circle in Germany, and equally independent in theory with the largest, is too well known to need any special enumeration. Such states were particularly numerous in Suabia.—P.

VOL. III.—NO. 42

^c "Its superficial extent is estimated by Roesch at 348 [Germ.] geographical square miles, or 967 [Fr. sq.] leagues."

^d "28 leagues."

^e Such is the language of the original, but it does not necessarily follow that a chain of primitive formation should be higher than one of secondary formation; many instances to the contrary occur.—P.

^f See *Württembergische Jahrbücher für vaterländische Geschichte*, by Memminger, 1823.

^g Stein's Geography, (in Germ.)

^h The measures here given are those of the original.

ⁱ These three rivers enter the Danube from the south, and consequently rise from the Alps, and not from the mountains previously mentioned.—P

^k *Reer. gest.* XXVIII. 5.

^l *De Reb. Goth.* 17.

or union of different nations in Germany; in short, it seems to be derived from *all* and *mann*, two words nearly the same both in German and English. The Alemanni were probably descended from the Suevi. Their government was monarchical, or at all events, they chose a chief when they began a war; their religion was the same as that of the other Germans, but they were distinguished from them by the greater ferocity of their manners. Their hatred against the Romans, excited them to many acts of cruelty, which were committed against their prisoners. Caracalla defeated them, but could not make them submit to his authority, and it was only by means of bribery that some were gained over to his service. They made themselves masters of the forts, which the Romans had built on the Rhine, and laid waste part of Gaul about the middle of the third century. They were afterwards driven back into Germany, and their country desolated, by Maximin. Their history indeed exhibits a succession of victories and defeats, until nearly the end of the fourth century,^a when they submitted to Maxentius.^b

Wurtemberg was formed into a county in the circle of Suabia about the middle of the eleventh century.^c The Emperor Maximilian changed it into a duchy in the year 1495. Many of the inhabitants embraced the reformation under Ulrich the Eighth, who took an active part in the league of Smalkalden. The number of protestants at present in the kingdom is estimated to be more than a million.

The kingdom of Wurtemberg abounds in mines, slate, marble, and different kinds of limestone that are used in building; it is also well supplied with coal, sulphur, salt and mineral springs. The land yields good harvests, and more than a half of it is in cultivation; the vineyards take up nearly a fiftieth part, the meadows about a seventh, and the forests occupy the rest of the country. The landed proprietors rear a great number of horses, oxen, pigs and sheep; merinos have been introduced, and are found to succeed.

The woods and the fields were so much overrun with game, that government found it necessary in 1817 to encourage the destruction of hares, rabbits and other kinds of game by which the crops were injured. The keepers of the forests are obliged to recompense the farmers for any injury that these animals may occasion. Two persons are appointed in every village,^d and their sole occupation is to destroy game.

There are many manufactories in Wurtemberg, but none of them are very important. The articles manufactured in the plains or low districts are cotton, linen and woollen stuffs; many wooden clocks are made in the high country; and paper mills, tanneries and iron works may be seen in the vallies.

But another and very important trade consists in spirits; there are not fewer than thirty distilleries in the district of Heilbronn, two hundred and twenty-six in that of Bahlingen, and sixty-three in that of Biberach. The spirits made

in these distilleries, are not obtained from wine, potatoes or grain, but extracted from the fruit of the small cherry trees that increase so rapidly on the mountains in the Black Forest. That spirituous liquor is generally known by the name of *kirschen-wasser*. The quantity consumed in the country, and exported every year, is sold for 130,000 florins, or £13,000.^e It furnishes the means of subsistence to more than a hundred and twenty families among the lower orders of society. In whatever estimation this liquor may be held by connoisseurs, it is not the less certain that the inhabitants of the Schwarz-Wald ought to raise a monument in memory of Thomas Leodgar, who invented it, and to whom the people are indebted for their wealth.

The foreign commerce of the kingdom consists chiefly the exportation of its wood, wines, grain, dried fruits, leather, linen and *kirschen-wasser*, and also of the wooden clocks that are made in the high districts. The countries to which most of these exports are sent, are Switzerland, France, Bavaria and Austria. It receives in exchange, cloth, oil, fine wool, raw silk and silk stuffs, tobacco and colonial produce.

As to the inland trade, it is believed to be protected by excluding foreign competition by means of prohibitory duties, and by the monopoly which government has imposed on certain articles. Thus, the cotton cloth,^f known by the name of the Chinese city in which it is made, cannot enter the kingdom; unwrought iron cannot be exported from it, and salt and tobacco are sold exclusively by government. For the purpose of encouraging commerce, a uniform system of weights and measures, founded on the decimal division, has been established. The management of the roads is committed to government, and some attempts have lately been made to improve them. Commercial communications are likewise facilitated by navigable rivers.

M. Memminger^g estimates the value of all the merchandise in the kingdom, at thirty-three millions of florins, or three millions three hundred thousand pounds sterling; the natural products, according to the same author, amount to sixteen millions of florins, and the manufactured products to seventeen millions. The value of the exports amounts to more than sixteen millions of florins.

According to Hassel, the revenue in 1821 was not less than 8,300,000 florins,^h from which if the sum derived from the domains and forests be deducted, 5,681,000 remain, the amount of all the taxes and contributions, that are imposed on the people; so that on an average, every individual in the kingdom, pays annually four florins or eight shillings in the shape of taxes. The expenditure amounted to 7,900,000 florins,ⁱ including the interest and extinguishment of the national debt, which at that time was estimated at 20,000,000 florins. But it must have considerably increased within the short period of two years, for, if a report made to the chambers in 1823 be correct, it was then equal to 25,679,616 florins. The revenue, although sometimes

^a "A. D. 388."

^h The following details are subjoined :

	Florins.
Domains	2,268,000
Direct taxes	2,000,000

	Florins.
Indirect taxes	2,553,000
Forests	351,000
Saltpetre and salt	94,000
Post office	69,000
Different receipts	404,000
Receipts in arrear	561,000

Total 8,300,000

ⁱ Some of the items may be mentioned: for the civil list, 666,000 florins; for the ordinary appanages of the royal family, 309,000; for the war department, 1,855,000.

higher than in 1821, has more frequently been lower; in 1824, one of the most prosperous years, it exceeded 10,028,000 florins.^{a b}

The harvests have more than once so completely failed, that government has been obliged to remit the taxes in several districts; the same cause has induced many individuals to emigrate to America and the southern provinces of Russia. Stein^c assures us that no less than twelve thousand persons emigrated during the first four months of the year 1817. But it must be admitted that a considerable number were influenced by religious notions; the *aurora borealis*, which appeared in Wirtemberg, during the month of February in the same year, was considered a sign or an injunction of the Lord, by which the people were commanded to leave the country.

It was determined in 1819 that the army should consist of nineteen thousand men in time of war, and six thousand in time of peace, exclusively of three hundred and seventy gendarmes. The contingent, which the state furnishes to the confederation, amounts to fourteen thousand men. It ought to be mentioned that a law was passed nineteen years ago, rendering it imperative on every bachelor from the age of twenty to forty, to enter the militia, which is made up of sixty cohorts, and each cohort of a thousand men.^d Those who have attained the age of forty, form a corps of reserve. The time fixed for the military service is ten years for the cavalry, and eight for the infantry. Officers were entitled to inflict corporal punishment on the soldiers, a privilege which has often been abused in the German armies. Government considered that a method of punishment so humiliating to private soldiers, was not tolerated in despotic countries; it was therefore abolished about twelve years ago; at present, no man in the army can be punished without the sentence of a court martial.^e It was fixed by a law passed in 1812,^f that the widows of sub-officers and soldiers, who had been slain in the field of battle, should be entitled to a pension equivalent to the pay of their husbands; their children too may be brought up at the royal orphan-houses at Stuttgart and Ludwigsburg, if their relatives are unable to maintain them.

Some notion of the number of inhabitants in Wirtemberg may be formed from the military force. Hassel estimated the population in 1822, at one million four hundred and forty-six thousand individuals, consisting principally of Germans, Wends,^g and Jews.^h But the number of inhabitants has increased since that period, and it appears from the excess of the births above the deaths, that the population amounted in 1826 to 1,517,770 souls, from which it follows that the average number of individuals for every English square mile, is upwards of two hundred and sixty-one,ⁱ a number that places Wirtemberg on a level with the most populous states in Europe.

^a "The revenue has sometimes been higher than in 1821, as in the year 1824, when it amounted to 10,028,000 florins; but it has occasionally been lower."

^b *Allgem. Deutsche Justiz-Kammer, &c.* February, 1825.

^c Stein's *Geography*, (in Germ.)

^d "There is a law by which all bachelors, from eighteen years to forty, are enrolled in a general militia, consisting of sixty cohorts, each of one thousand men."

^e "Corporal punishment in time of peace, was abolished, about ten years since, by a royal ordinance. This degrading penalty, which is not even tolerated in despotic countries, can now be inflicted only in extraordinary cases, and by sentence of a court martial."

^f "By a royal ordinance of 1812."

^g *Vaudois*, in the text of the original; *Wendes*, in the Table of Errata. *Waldenses*. (Hassel.)

^h In the above number are included 703,500 males and 740,600 females.

The law by which many, before the year 1817, were prevented from having fire-arms in their possession, has been wisely modified. That privilege is granted at present not only to landed proprietors, their stewards, the officers of government, the magistrates and the huntsmen appointed by the districts,^k but also to the tenants of isolated houses, and the proprietors of manufactories and storehouses. Each district may dispose of a certain number of guns, that are entrusted to the mayor, who gives them to any that wish to destroy noxious animals, or to guard their property against the depredations of thieves.

The press is not wholly free in the kingdom of Wirtemberg; but the restrictions imposed on it, indicate on the part of government, rather the desire of diffusing instruction and the light of knowledge, than the dread of any imaginary abuses, that may arise from a privilege which has now become necessary to the inhabitants of a civilized state. According to a law passed on the 30th January, 1817, any work may be published that contains nothing contrary to religion and the public tranquillity. The journals are equally free in time of peace, but during war, they must be examined by censors. It is the duty of the crown lawyers to prosecute the authors of blasphemous and immoral works, or of writings which tend to calumniate private characters, or to attack the conduct of the king and his ministers, or that of the members of the chambers, or of the representatives of foreign powers.

Government deserves to be commended for its zeal in diffusing knowledge among the different classes of the community. There is hardly a town of any size in the kingdom without a gymnasium, and not a small one without one or more schools. These institutions are attended by children from six to fourteen years of age, and schools of art are open for the instruction of mechanics.^l A gratuitous school has been established in every village, and schoolmasters repair twice or thrice a-week to the remote hamlets, where the pupils assemble in each other's houses. It may be affirmed, indeed, that almost all the children among the lower ranks of society are taught to read, write and cast accounts. The different seminaries are under the inspection of the clergymen and curates, but the scholars must be examined every year by professors, who are sent from Stuttgart and Tübingen. The schools for the lower orders^m are annually increasing; thus there were not more than two hundred and sixty in 1823, and the number of pupils did not exceed ten thousand and sixty-four; but in 1825, the number of schools amounted to three hundred and forty-two, and the scholars to fourteen thousand and eighty-seven. The masters of the different public schools are mostly selected from the seminaries at Esslingen and Ehingen, which may be considered normal schools. Clergymen superintend some places of education,ⁿ but in ge-

The tables of Hassel enable us to arrive at an approximation concerning the number of the different classes.

ⁿ "Private seminaries"

neral, those who devote themselves to the noble career of instructing youth, are educated and trained by men of distinguished merit. The sons of the lower orders, if they are desirous of following the ecclesiastical profession, and show any talent, for it is a matter of indifference whether they be catholic or protestant, are educated at the expense of government.

Two orders of knighthood have been instituted in the kingdom of Wirtemberg, and the honour, which the prince may thus confer, was intended as a reward for civil services and military merit. The officers, who receive this distinction, wear a gold medal, and the soldiers a silver one.^a *Vir-tutis amicitiaque fœdus* is the motto on the cross of the Golden Eagle, which was founded in 1702. The members are foreign princes or officers of high rank, and according to the statutes of the order, an intimate union must subsist between them; they must assist each other in the field of battle if it be in their power, and perform good offices to one another in the ordinary occurrences of life. The number of knights is limited to fifty, but as none can be admitted that are not sprung from an ancient and noble family, the order of Merit was instituted in 1806 for those who cannot receive the decoration of the Golden Eagle. The members wear a medal with the inscription *Bene merentibus*, and they are divided into grand crosses, commanders and knights. These honorary distinctions, the influence of wealth, and the importance of civil employments, have contributed to form several distinct classes in the kingdom.

The dukes of Wirtemberg shared, from the commencement of the sixteenth century, the rights of sovereignty with the assembly of the states, which was formed by the fourteen highest ecclesiastics and eighty-nine deputies from the towns and districts. When Napoleon raised the dutchy into a kingdom, the assembly was dissolved. But after the deliverance of Germany, to use a German phrase, or more correctly, after the establishment of the new Germanic confederation, the districts and the nobles claimed their privileges and a national representation, by which the power of the crown might be confined within proper bounds. According to the constitution, the king is of full age at eighteen years; his person is inviolable; he may be either a Catholic or a Protestant; to him only belongs the ratification and execution of the laws, the right of administering justice, and of making peace or war, and the command of the army.

Liberty of conscience and equality among the different Christian communions have been solemnly sanctioned by the constitution, and a very important privilege has thus been conferred on the different sects in the kingdom. No legislative enactment can be put in force, until it has been approved by the general assembly of the districts; the same body fixes the amount of the taxes, and regulates the contributions; lastly, individual liberty has been guaranteed, and the confiscation of property abolished.

The assembly consists of thirteen members, who are chosen for life among the nobles, whose annual income amounts to at least fifty thousand florins, and of six Protestant ecclesiastics, a Catholic bishop, two Catholic clergymen, and four lawyers.^b The deputies elected by the people must have an income of eight thousand florins. A deputy is elected in the towns, for every two hundred inhabitants.

^a "The honorary distinctions intended as a reward for civil services and military merit, consist of two orders of knighthood, and a gold medal for the officers and a silver medal for the soldiers."

The deputies are appointed for six years, and that period can only be abridged by an extraordinary dissolution. A fund has been established out of which the expenses of the assembly, and even the travelling expenses of the members are defrayed. The deputies of the districts are elected by the land proprietors, but no one can exercise his elective privileges until he has completed his twenty-fifth year. Three members are chosen by the upper chamber, and as many by the lower, and out of that number, the king nominates the speakers of the two houses.

Government has shown itself favourable to the representative system, and in order to preserve the principles on which it depends, a conservative council has been created. It consists of lawyers and magistrates, one half of whom are appointed by the king, and the other by the lower chamber. The council passes judgment on the public functionaries and deputies, that are accused of acting unconstitutionally. It judges concerning the differences that may arise between the ministers and the districts concerning the interpretation of the constitution. The districts may accuse the king's ministers, but the latter cannot make a public functionary resign his situation for a lower office, much less deprive him of office, unless he be guilty of a crime, or unfitted for the discharge of his public duties by want of capacity.

The kingdom of Wirtemberg is divided into four circles, which bears the names of the rivers that water them, or of the principal mountains that form the western boundary of the state. Thus, the circles of the Neckar and the Jaxt are situated on the north, that of the Schwarzwald or Black Forest on the west, and that of the Danube on the south. Twelve provincial and sixty-four subordinate courts of justice have been instituted in these four great divisions of the kingdom. There are a hundred and thirty towns in Wirtemberg, a hundred and twenty-eight burghs, one thousand one hundred and fifteen villages, and two thousand four hundred and ten hamlets.

Stuttgart or Stuttgard, the capital of the kingdom, rises in the middle of a fruitful valley, surrounded with hills and vineyards, on the banks of the Nesenbach. The town has been lately enlarged, and it contained in the year 1823,^c one thousand nine hundred and eighty houses, and twenty-seven thousand seven hundred and eighty inhabitants, exclusively of the garrison.^d The streets are broad and straight; two of them are remarkable for their regularity, and the number of fine buildings. Stuttgart is the seat of the supreme courts in the kingdom, and the king possesses two palaces, of which the more modern has been much admired for its architecture and the magnificence of its interior; a collection of natural history is contained in the other. Among the buildings that ought to be mentioned, are the principal church, the chancery and the opera. The useful institutions are a library containing more than 200,000 volumes, a collection of twelve thousand bibles and a great number of manuscripts; a museum of arts, an academy of painting and sculpture, and a botanic garden. The commerce of the capital consists principally in cloth and linen.

The small town of Esslingen may vie with Stuttgart in the beauty of its situation; it is encompassed by vineyards and forests, and watered by the Neckar, and was formerly among the number of free cities; it contains at present a court of justice, and its population amounts to 5600 inhabitants.

^b "Four members of the different learned societies in the kingdom."

^c In the original, the date 1823 is confined to the population.

^d Hoffmann Umriss zur Erd und Staatenkunde, &c.

If we follow the winding course of the Neckar, we remark on its left bank, and at the distance of eight miles^a to the north of Stuttgart, the town of Ludwigsburg, a royal residence, peopled by six thousand individuals, and containing a fine castle, an orphan hospital, a house of correction, and several cloth manufactories.^b At the distance of ten leagues in the same direction,^c and on the opposite bank of the river, may be observed a larger town, that of Heilbronn; it was formerly a free city and a commandery of the Teutonic Order; it is enriched by the produce of its vineyards and distilleries, by its lead works and the navigation of the Neckar. Hall, which lies ten leagues to the east of the last place, has been called *Swabian Hall* (*Schwabisch-Hall*), to distinguish it from many others of the same name. Situated on the banks of the Kocher, surrounded with rocks, and peopled by more than 6400 inhabitants, it owes its origin to the abundant saline springs in the vicinity.

Ellwangen on the Jaxt, the metropolis of a circle, and the seat of a theological university, cannot be compared in other respects with Gmünd, a town on the Rems, with a population of six thousand individuals, and well known for its different manufactures, particularly for the skill which its artisans have attained in working the precious metals. Gesslingen or Geisslingen carries on a trade in different articles, made of ivory, bone and wood; the quantity exported may be equal in value to 90,000 florins. Four thousand five hundred inhabitants make up the population of Göppingen, a town watered by the Fils. It has manufactories of cloth and pottery. The mineral waters of Ueberkingen, situated in a romantic country at no great distance from the last town, are visited every year by many strangers.

The neighbouring village of Hohenstaufen stands on a height, that commands an extensive view. The old castle, now in ruins, still towers above the village; it was for a long time the residence of the emperor Barbarossa. The last descendant of the family of Hohenstaufen, was young Conrad,^d who, for having attempted to ascend the throne of Sicily, a country over which his father had reigned, but which the Pope had made over to Charles of Anjou, perished on the scaffold at Naples in 1269.^e

Reutlingen, formerly a free town, and at present the metropolis of the circle of Schwarzwald, contains nine thousand inhabitants. It possesses a lyceum, its vineyards cover the sides of the Alp and the Georgenberg, and it carries on a trade in leather, lace and cutlery.

Tubingen, at the confluence of the Neckar and the Steinach, has been entitled the second capital of the kingdom. The population amounts to seven thousand individuals; it has a university, attended by eight hundred students, a public library, containing sixty thousand volumes, a faculty of theology, a seminary for Lutheran clergymen, an observatory, and a veterinary school. The town cannot be commended for its appearance; the streets are crooked and narrow, the houses are gloomy and ill built.

Ulm, peopled by eleven thousand inhabitants, has a bet-

ter claim to the rank of second capital. It was formerly a free and imperial town, and its population was at one time more considerable, for it contained in 1808 more than fourteen thousand individuals. Its situation on the frontiers of Bavaria, at the confluence of the Blau and the Danube, the fortifications that defend it, its manufactures and transit trade, by which its declining commerce is still supported, put it on a level with the principal towns in Wirtemberg. Its fortifications, it must be admitted, are not as formidable as when the French made themselves masters of it, but it is equally certain that it might be rendered a much stronger place than it is at present.^f As it did not offer any resistance to the French armies, its buildings were not injured; the most remarkable are the town-house, the public library, and the church of Munster,^g a building that cannot be too highly commended on account of its proportions and rich Gothic architecture.^h The trade of the town may have fallen off, but it possesses other claims to distinction. The pastry known by the name of Ulm bread, its asparagus, and the snails fattened in the vicinity, are duly appreciated by gourmards; could it be believed, that more than four millions of these animals are annually exported?

Biberach on the banks of the Riess, a town peopled by five thousand inhabitants, carries on a trade in paper and linen.

The kingdom of Wirtemberg has been often visited by antiquaries. Several ancient monumentsⁱ are situated in the southern part of the country. The ruins of an aqueduct about three leagues in length, may be observed in the neighbourhood of Rothenburg on the Neckar. The *Devil's Wall*, which rises on the banks of the Danube, and of which traces have been discovered at no great distance from Ellwangen, forms only a part of the remains of a vast line of fortifications constructed by the Romans.^k The remains of Roman earthen works, from which a great many vases have been collected, may still be seen between Weiblingen and Endersbach, not many miles from Stuttgart. An altar and several basso-relievos have been found in the same part of the country. The names of several places are connected with ancient recollections. *Beinstein* or *Beystein* signifies near the stone, and a monument was erected there by the Romans. *Kalkofen*, where Roman potteries were discovered a few years ago, has always borne the same name, which signifies a limekiln.

We abstain from making any reflections on the morality of the people of Wirtemberg; it may be remarked, however, that the number of criminal prosecutions in the different courts, during the year 1823, has been published in a German journal,^l and the prevalence of crime must necessarily be inferred from the result. According to the same document, the number of persons prosecuted for crimes during the same year, was not less than eight thousand five hundred and sixty-six. It appears from the population at the time, that the individuals accused were to the rest of the inhabitants as one to a hundred and sixty-nine.

^l Allgemeine Handl. Zeit. März, 1825, p. 147.

To what can so frightful a state of society be attributed, unless to the remissness of government and the imperfection of the laws?

Political commotions, changes in dynasties and governments, the long residence of foreign armies, the corruption of morals, the ordinary consequence of wars and revolutions, the destruction of trade, and the difficulty of procuring the means of subsistence for the lower orders, tend to increase crimes in a country. It is then that wise legislators see the necessity of a new code adapted to the new wants of society. It is then that the laws must be simple, precise and distinct; it is then, above all, that the diffusion of education among the lower ranks, serves as a barrier against immorality. The government of Wirtemberg has experienced the advantages, that may be derived from the instruction of the people; it will without doubt finish what it has so successfully begun.

The grand duchy of Baden forms a long and narrow tract that extends along the right bank of the Rhine, from the lake of Constance to the country beyond the mouth of the Neckar. It is bounded by the Rhine on the south and the west, by Bavaria and the grand duchy of Hesse on the north, and by the kingdom of Wirtemberg and the principalities of Hohenzollern on the east; its irregular frontiers on the south-east are also contiguous to the same principalities. It is unnecessary to mention the ancient people that inhabited the country; they were the *Alemanni*, of whom some account has been already given in the description of Wirtemberg.

The length of the grand duchy may be equal to a hundred and sixty-two miles; the breadth to thirty-eight in the northern districts, seventy-six in the southern, and ten near the centre.^a Crome estimates the superficial extent at two hundred and seventy-four German square miles, which being reduced into English measure, makes the whole surface not less than three thousand two hundred and eighty-eight square miles.^b

The greater part of the country, particularly from the centre to the southern extremity, consists of high mountains and fruitful valleys; the plains are comparatively insignificant both in number and extent. The mountainous country forms the highest part of the Schwarzwald or Black Forest. The most elevated summit or the Feldberg reaches to the height of 4610 feet above the level of the sea; the lowest or the Winterhauch does not exceed 1640.^c The Storenberg, the Rosskopf, the Pöelle and the Todnauerberg have become celebrated in military history, on account of the fine retreat made by General Moreau in 1796. The Herberg and part of the Odenwald, two chains, in which the Kniebis is one of the most elevated points, extend to the northern extremity of the duchy.

The heights of the Black Forest, nearest the Rhine, are composed of granite, and those in the direction of Wirtemberg, are formed by sandstone and other rocks, belonging to what Werner and his disciples have termed the transition

formation; of the same period is the chain that extends northward to the banks of the Neckar, and it appears too that trapp rocks and others of a volcanic origin, have been observed in those mountains. A belt of secondary limestone extends along the western declivities of the Schwarzwald; but the land beyond it on the banks of the Rhine, from Bale to Manheim, belongs to the tertiary formation, or to the one succeeding the formation of chalk, and contemporaneous with that in the neighbourhood of Paris.

The Bodensee or the lake of Constance, forms part of the boundary of the grand duchy. The others, which have been incorrectly denominated lakes, are rather large ponds, almost all of which are situated in the mountainous country, and at a considerable elevation; that of Schluch on the Feldberg, is at the height of 2287 feet; that of Echner and several others are at least 1467 feet above the level of the sea.^d

The climate is mild and agreeable in the lower districts, or on the banks of the Rhine, the Maine and the Neckar; but the winters are very rigorous in the mountains and particularly in the chain of the Schwarzwald; even in summer the air is always keen, and the snow seldom melts in the highest region.

The forests in the grand duchy of Baden occupy a surface of one million five hundred and eighty thousand acres;^e one million three hundred thousand are cultivated, two hundred and nine thousand are waste, three hundred and thirty-five thousand are in meadow and pasture, seventy-four thousand are planted with vines, and a hundred and fifty thousand belong to the different towns, burghs and villages.^f The mountains are covered with thick forests of oaks and pines, but the low grounds and the vallies produce varied and abundant harvests. Crops of poor oats and potatoes can hardly be raised in the high country, and the cherry does not ripen before September; but the spectacle is very different in the plains and vallies; the vine, the almond, the chestnut and various other fruit trees, different kinds of grain, hemp, flax and the plants most useful to man, grow luxuriantly, and diffuse wealth and plenty over the land.

Different products are obtained; their number and importance depend on the nature of the country. Many animals haunt the forests, game abounds in the fields, and a considerable revenue is derived from the fishings on the Rhine and the lake of Constance. Salmon are not uncommon, and the carp of the Rhine, some of which weigh more than forty pounds, are considered a great delicacy by the wealthy. But though not so well known as those that have been last mentioned, the ablet^g (*Cyprinus alburnus*, Linn.) is perhaps a more valuable fish. The scales of the ablet have given rise to a branch of commerce; they are exported into Saxony, France and Switzerland, and used in giving a lustre to imitation pearls, by which it is difficult to distinguish them from real.

The mineral riches of the country, though not great, consist at least of many different kinds. About 12,000

^a "Length about 65 leagues—breadth in the north 11 leagues, in the south 31, and in the middle 4."

^b "761 geographical leagues, Fr. measure."

^c We may mention the heights of some other mountains in the duchy, as they are marked in the tables of Hassel.

^g "Ablette," Eng. blay or bleak.

quinta's of iron, 700 of lead, and nearly 500 marks of silver, are annually extracted. The other products are copper, zinc, arsenic, alum, sulphur, coal, and nearly 4000 quintals of salt. Coarse and fine potter's clay, slates, marble and alabaster are found in several places; even gold might be mentioned among the metals, for particles of gold are collected in the alluvial deposits that are watered by the Rhine. A hundred and twenty individuals are employed in seeking it, but the quantity collected every year, does not exceed on an average £700.^a

That part of the Black Forest, situated within the grand dutchy, may rival that which belongs to Wirtemberg, for its *kirschen-wasser*. Several vineyards are noted both for the quantity and quality of the wine produced by them; the most noted are those of Constance, on the banks of the lake, and next to them the vineyards of Margraff and the Bergstrasse. The domestic animals, with the exception of the horse, are of a good kind and very numerous. Many inhabitants are employed in weaving or manufacturing hemp and flax. The raw and spun hemp exported every year from the territory of Ettenheim, amounts in value to 30,000 florins; and the hardware trade in the district of Pforzheim, occasions a circulation of 1,700,000. Many wooden clocks and other articles, which it is unnecessary to enumerate, are made in the Schwarzwald. It may suffice to state that notwithstanding the stagnation of commerce, there were a few years ago in the grand dutchy of Baden nearly 75,000 workmen employed in different branches of labour.

The transit trade is very active; the exports are also considerable; they consist chiefly in timber, which is sent to Switzerland, France and the Netherlands. The other exports are wines, corn, hemp, dried fruits, *kirschen-wasser*, tobacco, mineral water and hardware goods; the country receives in exchange French wines, salt, different manufactures, colonial produce and a number of horses.

Some genealogists have maintained that the family of Baden was sprung from the Gothic kings; others affirm it to have descended from Etichon, duke of Alsace in 684. But it is certain that the lordship of Baden was erected into a margraviate by Henry the Fowler, about the commencement of the tenth century. Hermann, the son of Berthold, and the first prince whom the chroniclers mention, flourished during the eleventh century; he derived from Judith, his first wife, the heiress of Baden, the principality from which his successors took the title of margraves. But the marquise was governed by several families that became successively extinct.^b The country was made an electorate in 1802, and some years afterwards, it was erected into a grand dutchy.

It has been already observed that the population in Germany is annually increasing; the same remark may be still more applicable to the grand dutchy of Baden, than to many other states in the same country. The number of inhabitants was estimated by Stein in 1813, at 1,001,630, and by Hassel in 1822, at 1,040,700. But the increase has been still greater since that period. According to M. Adrian

Balbi,^c the population in 1826, was not less than 1,130,000. Stein remarks in his geography, that the women were much more numerous than the men in 1813; indeed it appears from his calculations that the excess was equal to 31,343.^d The same writer attributes the disproportion to the ravages of war, and to the fact that many young men migrated to foreign countries in order to avoid the conscription. But it is not likely that these were the only causes, because Hassel has shown that there were 27,400 more women than men in the country during the third year after the peace, and because nearly the same proportion subsisted at a still later period in the year 1826. The blessings of peace, which Europe has so long enjoyed, are not then the sole causes of the increasing population; it must be partly attributed to the diffusion of wealth,^e and to such discoveries as vaccination; for during twenty years, the augmentation had not been sensibly diminished by all the evils of war. As to the difference in the number of the two sexes, it must be in a great degree occasioned by the frequent migrations that take place among the working classes, an important element, which does not appear to have entered into the calculations of statistical writers. It is difficult to believe that the men averse to the military life, are so numerous as Stein supposes, or that the habits of the people in Baden are so peaceful; they cannot be reproached for want of valour; besides, fear prevents very few in any country from entering the army.

The reigning family of Baden adheres to the Augsburg confession, but nearly two thirds of the population are Catholics; the other inhabitants are mostly Lutherans and Calvinists; the latter, however, are not more than a fourth part of the former; there are, besides, some Mennonites and Jews, the last of whom enjoy all the rights of citizens.^f Several convents for women still remain in the grand dutchy, but the purpose for which they were erected has been altered; they now serve for places of education. By a law passed in 1811, no person can take the vows before the age of twenty-one; the period during which the vows last, is limited to three years, at the end of which time, the nuns may return to the world, and participate in its duties and enjoyments. Silence, austerity, and almost all the obligations mentioned in the rules of different monastic orders, have been abolished.

The government of the grand dutchy was purely monarchical; but the sovereign published a decree on the 16th of March, 1816, in which, after having announced his desire of securing the happiness, tranquillity and liberty of his subjects, he declared that these intentions could only be accomplished by granting them a constitution, in which the rights of the prince and the people might be more accurately determined. According to the constitution,^g the duke possesses the right of making peace or war, proposing laws, and levying contributions, dispensing mercy to criminals, conferring titles of nobility, and lastly, of approving or forbidding the establishment of religious societies. The

sects, the following table, given by Hassel for 1822, may still serve to show their numerical importance.

Catholics,	705,850
Lutherans,	248,900
Calvinists,	69,100
Mennonites and other sects,	1,450
Jews,	15,400

Total 1,040,700

^g The constitution was published, Aug. 22, 1818.—P.

^a "Annual amount, 15,000 francs."

^e "New institutions"—abolition of feudal services, more equal division of landed property, extinguishment of mortmains, greater personal liberty and freedom of trade and commerce, and the numerous other improvements in the social state which have arisen from the convulsions of the French revolution, and of which the diffusion of wealth may be considered as one among many beneficial consequences.—P.

^f The increase in the population being nearly the same in the different

states consist of two chambers, which must be convoked at least once every two years; they fix the amount of the taxes and contributions, assist in enacting laws, and have the privilege of proposing whatever may contribute to the prosperity of the state.

The conscription has not been abolished; but the Napoleon Code, which was introduced into the country, has been superseded by the Roman law, and the ancient customs that were established in the dutchy before the French conquest. A new system of weights and measures, according to the decimal divisions, may be considered the only benefit that the country has derived from its connexion with France.

The inhabitants are divided into four classes; the nobles, knights, burgesses and peasants. The nobles possess baronies and estates, to which different privileges are attached. The knights are the members of the three orders of knighthood instituted by the prince. The burgesses hold property or civil offices in the different towns;^a none can enjoy the rights of citizens, who cannot read, write and manage their own affairs.

Government has promoted education by different institutions, of which the inhabitants are daily reaping the advantages. It maintains two universities, those of Heidelberg and Freyburg; it has founded four lyceums, one at Constance, another at Baden, a third at Carlsruhe, and a fourth at Mannheim; it has contributed to the establishment of other schools, as the institution for the deaf and dumb, the academy of architecture, and the two commercial seminaries at Mannheim and Carlsruhe. There are besides in the principal towns, ten gymnasiums and fifteen schools, in seven of which Latin is taught, and also a school of theology for the Catholics at Mersburg, and another for the Protestants at Carlsruhe. But in the year 1815, government found it advisable to impose some restrictions on the power that a parent has of educating his children; according to an enactment made in that year, the sons of burgesses, merchants and peasants, who have no reasonable expectations of receiving a patrimony, equal at least to 8000 florins, are not permitted to study the law, or to choose the profession of the bar, unless, indeed, they distinguish themselves in such a way as to afford indications of future talent or eminent success. The measures of government were rendered necessary by the difficulty experienced in finding employment for the lawyers and attorneys in the country, as their number was three times greater than that required for conducting all the business of the different courts.

If the number of criminals in the grand dutchy be compared with those in the kingdom of Wirtemberg, a very great difference will be found in that respect at least, between the two contiguous countries. According to the

^a "The population is divided into four classes, lords (*seigneurs*), knights (*chevaliers*), burgesses or citizens (*bourgeois*), and peasants. The lords consist of all those who possessed principalities or counties in the country, and who still retain many peculiar privileges. The knights are the members of the nobility who possess seignorial estates, and the members of the three orders of knighthood instituted by the prince. The citizens are those who hold property, rents or office."—The inhabitants of Baden consist of three classes, nobles (*die Adel*), citizens (*bürger*), and peasants (*bauern*). The former are divided into two ranks, mediatised or peers (*standesherrn*) or such as have the privilege of sitting personally in the upper house of the parliament or assembly of states, and such as possess seignorial estates (*rittergüter*) and are represented in the upper house by deputies. (Hassel.)—P.

		^b Revenue.
1821	.	9,651,827 florins.
1822	.	9,597,938

reports which we have examined, the number of persons who are prosecuted annually for crimes, varies from six to seven hundred; so that the proportion between those accused of crimes and the other inhabitants, is as one to sixteen hundred.

It appears from the report made to the chambers in 1825, concerning the administration from the year 1821 to 1823, inclusive, that the mean term of the revenue may be estimated at 9,586,000 florins; according to the reports relative to the expenditure, it may amount to 9,497,000.^b The national debt was equal in 1820 to 19,000,000 florins, and the expenses of the civil list to 2,000,000.

The grand dutchy of Baden is obliged to furnish a contingent of ten thousand men to the Germanic confederation. The army consists of an effective force equal to eleven thousand men, and a reserve amounting to seven thousand. The Jews in the country, having been long averse to the military service, the individuals amongst them, on whom the conscription falls, are each permitted to deposit 400 florins at the office of the war department, and these sums are given to substitutes, who are always very willing to enter the army on such conditions.

There are seven principalities and two counties in the grand dutchy, and the noble proprietors of these states enjoy many important privileges. The country is divided into six circles, bearing the names of the different rivers and the lake of Constance,^c and containing a hundred and eight towns, thirty-six burghs, two thousand four hundred and twenty-seven villages and hamlets, a hundred and fifty-four thousand seven hundred and ten houses, which, according to the lowest calculations, were valued in the different insurance offices^d some years ago, at three hundred and fifty millions of florins.

The inhabitants of Baden speak a harsh and guttural dialect, that appears to be composed of ancient German and Slavonic; but it is different in different districts, particularly at the two extremities of the country; thus, it is easy to distinguish by their pronunciation the natives of the Schwarzwald from those of the Odenwald.

Wertheim, a town situated at the confluence of the Maine and the Tauber, is a mediate possession of the prince of Læwenstein under the sovereignty of the grand duke of Baden. It is encompassed with walls and adorned by two castles; it contains 3500 inhabitants, who carry on a trade in leather, spirits and wines; the conveyance of goods on the Maine forms an important part of their commerce.

Mannheim or Mannheim, the largest town in the grand dutchy, has thrice within a century and a half, experienced the fatal effects of war. Devastated by the Bavarians in 1622, it had hardly recovered from its losses before it was included in the destruction of the Palatinate, a decree that

disgraces for ever the administration of Louvois. The fury of the French soldiers could not be restrained; almost all the houses were demolished, and the generals of Louis the Fourteenth saw their men plunder the tombs of the palatines. Rebuilt by its princes, it was bombarded in 1795 by the republican armies of France, and a great many of its buildings were reduced to ashes. But its advantageous situation at the confluence of the Neckar and the Rhine, the activity of its commerce, and the importance of its manufactures, which consist in linen and woollen stuffs, and jewellery made chiefly of the alloy, that is known by the name of *Manheim gold*, have contributed to restore it to its ancient prosperity. Its population amounts, according to Hassel, to 21,525 persons. The streets are broad and straight; there are six squares, two fountains, a ducal castle, a large building which contains the exchange, and seven churches; the finest of the churches forms a part of the ancient residence of the Jesuits, which still attests their former wealth and power. The observatory, enriched with every useful instrument for astronomical purposes, might be considered an ornament to any town. It possesses besides a theatre of anatomy, a school of midwifery, a botanical garden, a museum of natural history, a library, a gallery of paintings, and a collection of antiquities.^a It is unnecessary to mention its lyceum, but it may be observed that a meteorological society has been instituted, and some of the members have distinguished themselves by their researches in a department of knowledge which is still in its infancy.^b

Heidelberg is situated ten leagues to the south-east of Manheim, at the foot of a mountain on the south bank of the Neckar. The town was founded in the twelfth century; it contains at present 10,500 inhabitants. The houses are generally well built, and some of the squares have been much admired. Nearly seven hundred students attend its university, which ranks with the most ancient in Germany;^c indeed one cannot observe without interest the different establishments for the instruction of youth, the botanical gardens, the numerous museums, the collections of philosophical instruments, and the valuable libraries. The most celebrated scholars in Europe resorted to Heidelberg during the sixteenth century. It was the residence of Olimpia Fulvia Morata, who was not less distinguished by her virtuous and exemplary life, than by the extent of her learning, and the superiority of her genius. Compelled to take refuge in Germany, on account of her attachment to protestantism, she filled the chair of ancient languages in the university of Heidelberg, and was considered a prodigy of learning, although not more than twenty-nine years of age at the time of her death.^d Francis Junius was one of the celebrated men that have been born in the town; he wrote several valuable works on the ancient languages of the north, and on antiquities.

A castle is situated on the hill that commands Heidelberg; there too may be observed the famous tun, which was substituted for the one broken by the French during the reign of Lewis the Fourteenth. It contains 130,000 gallons,^e and the weight of the iron that encircles it, is up-

wards of 12,000 pounds. The first hot houses in Europe were built near the same castle; from its walls may be seen the finest country in the ancient palatinate, and the fruitful vineyards of Heidelberg and Weinheim, the latter a small town of 4500 inhabitants, situated near the frontiers of the grand dutchy of Hesse.

The ramparts of Philipsburg were destroyed by Louis of Bourbon, and the place was taken forty years afterwards by Louis, dauphin of France.^f The castle, formerly inhabited by the sovereign bishop of Spire, is situated in the pleasant town of Bruchsal, which contains a population of six thousand individuals. Durlach, situated in a fertile plain on the Pfinz, is peopled by four thousand inhabitants.

Carlsruhe or Karlsruhe, the capital of the grand dutchy and the chief town of a district, is situated at the height of three hundred and seventy feet above the sea. It is built with much regularity; the streets are straight, all of them terminate in front of the ducal castle, and diverge from each other in the form of a fan. That singular arrangement has a very fine effect when the town is illuminated. The gardens and woods that extend behind the castle, form agreeable public walks, and the residence of the prince must be admired by every one for its elegant yet simple architecture. There are different collections in the town, but the most valuable are the ducal library and museum of the prince. The buildings are finer than in most places of the same size; the Lutheran and Catholic churches are considered the best works of the celebrated architect Weinbrenner. The theatre is a light and elegant building, and if our limits would permit, it might be worth while to describe some of the private houses on account of their architecture. The population of Carlsruhe amounts to sixteen thousand individuals; as it is the residence of the court, it cannot be supposed a place of trade, still however it has been long known for its different articles of luxury, such as jewellery, watches, household furniture and carriages.

Reuchlin, one of the most remarkable men that flourished in the sixteenth century, both for his erudition and his opinions concerning the reformation of Christianity, attempted to prove that Pforzheim, his native town, was founded by Phorcys, the Trojan auxiliary of Priam. Other learned men, who lived during the same period, maintained that the town was formerly called *Orcynheim*, from the name of the vast forest mentioned by Julius Cæsar, and which ancient writers designated the *Sylva Hercynia* or *Orcynia*. It has been affirmed, on the authority of these fanciful etymologies, that the town which the Romans called *Porta Hercynia*, was no other place than Pforzheim.^g Its antiquity may be considered doubtful; indeed it is very probable that it was not known to the ancients. Pforzheim is situated at the foot of the Schwarzwald, and at the confluence of the Enz, the Nagold and the Wurm; its population, according to Hassel, amounts to six thousand five hundred individuals. It contains a house of correction and an orphan hospital; it carries on an important trade in timber.^h

^a The four last are contained in the right wing of the ducal palace.—P.

^f "The fortifications of Philipsburg are now dismantled; it was taken by Louis of Bourbon [in 1614,] and by Louis, dauphin of France, [in 1688,]" It is not stated in the original that the ramparts were destroyed

by Louis of Bourbon; on the contrary, its fortifications were strengthened by the French, who retained possession of it till 1676. Moreri.—P.

^g "These forced etymologies do not prove, as some have pretended, that this town must have been called *Porta Hercynia* by the Romans."

^h There are twenty-one manufactories of jewellery in Pforzheim, and the value of the goods sold yearly is equal to 600,000 florins. Convers. Lex.—P.

The ruins of a Roman town were discovered between Durlach and Ettlingen in the year 1802; but antiquaries have not yet agreed as to the name of the place.

Rastadt, on the banks of the Murg, owes its celebrity to the congresses that have been held within its walls, and to the massacre of the deputies of the French republic. It contains two thousand four hundred inhabitants. A ducal castle, the principal edifice, may be remarked not only for its romantic site, but for the Turkish trophies, and other collections, which have been placed in it. The trade, which it has long enjoyed, may be considered great in proportion to the number of its inhabitants; its cutlery and snuff-boxes are exported to different parts of Germany.

Baden or Baaden,^a a place about six miles from Rastadt, has derived its name from its mineral springs and its baths, which were well known and frequented in the time of the Romans. The antiquities that have been found in the vicinity, form a valuable collection. The town is peopled by about three thousand inhabitants. None of the buildings can vie with the ancient college of the Jesuits.

A road from Baden to Offenburg passes through the village of Sassbach, where the traveller cannot see without emotion an old and decayed walnut tree, for it was there that Turenne expired on the twenty-seventh of July, 1675. The virtues and military glory of that great man are appreciated by all; they are admired in other countries as much as in France. A detachment of veterans is stationed in the village; to observe their sergeant describe the engagement, and show the cannon ball that put a period to the hero's career, one might imagine that Turenne had died in the last campaigns of Germany.

The small town of Offenburg contains about 3000 inhabitants, and the lands belonging to it are fruitful in vineyards. The population of Lahr or Lohr has much increased of late; it may amount at present to nearly five thousand inhabitants.^b The cause of its prosperity must be ascribed to its trade, which is becoming greater every year. Friburg or Freyburg stands on the banks of the Treisam, at the foot of the mountains of the Black Forest. Peopled by ten thousand five hundred inhabitants, possessing a gymnasium, a university that is still well attended, and different scientific collections, it has been considered one of the most important towns in the grand dutchy. Many of the houses are well built, and the cathedral has been remarked for its architecture and lofty tower, which rises to the height of five hundred feet.

Brisach or Old Brisach, or as the Germans call it, *All-Breisach*, is supposed to have been founded by Drusus; if that opinion be correct, it was probably the ancient capital of the *Brisagavi*, a German tribe, subject to the Alemanni. The fortifications of Brisach were destroyed by Maria Theresa. It contains about two thousand five hundred inhabitants; although watered by the Rhine, it is not a place of much trade.

It may be readily inferred from the nature of the country, which is principally occupied by the mountains of the Black Forest, that few towns of any consequence are situated in the southern part of the grand dutchy. The only two that can be mentioned are Willingen and Constance. But before we pass the chain of the Schwarzwald, it may be stated, that the thermal springs near the small village of Badenweiler^c have been known for nearly two thousand

years. A considerable establishment was founded there by the Romans; the remains of their works are still apparent, occupying an extent of two hundred and twenty feet in length, and eighty in breadth.

Willingen is situated near the confines of Wirtemberg, in a lofty valley on the banks of the Big; it contains a population of three thousand three hundred individuals. Another town, Constance or Konstanz,^d more important than the last place from the number of its inhabitants, and better known from the council that was held within its walls in the year 1451, is situated in the same circle. Constance gives its name to the lake on which it stands. The two most zealous precursors of the reformation, John Huss and Jerome of Prague, were condemned to death by a decree of the council. Indignant at the corruption of the clergy, they chose rather to be burnt alive than to recant their opinions on the necessity of abolishing abuses.

The following remarkable passage for the time, may be found in the treatise on the church, a work written by Huss in the year 1413. "The church may be defined a mystical body, of which the head is Jesus Christ, and the members, the just and the predestined. The latter cannot be separated from the church by an unjust excommunication; *their spirit beareth witness to his spirit that they are the children of God.*"

The sovereign pontiff, the cardinals, the bishops, belong to the body of the church, but the sovereign pontiff is not the head of it. The church would exist, although there were neither pope, cardinals nor bishops. Popes, cardinals, bishops and priests cease to be members of the church by the commission of sin. Whatsoever ye bind on earth, says our Saviour to his apostles, shall be bound in heaven; whatsoever ye loose on earth, shall be loosed in heaven. If the popes, as the successors of the apostles, claim the same power, it can only be exercised through Jesus Christ, for as it requires an infinite power to justify a sinner, it must be the attribute of the divinity. No sins can be remitted, without repentance on the part of the sinner; absolution of itself therefore cannot be sufficient. The faithful, without doubt, owe a reasonable obedience to their bishops; but Christians have a surer guide for their conduct than the word of man; they have the word of God, contained in the Old and New Testaments."

A turret, in the ancient convent of the Franciscans, served as a prison for Huss, who was burnt in the suburbs^e of Constance. Jerome of Prague shared the same fate; as undaunted as his friend; it is said when the executioner endeavoured to kindle the funeral pile behind him, the martyr desired him to set fire to it in front, adding, that had he been afraid of death, he might have escaped from his judges.

Constance, formerly a free and imperial town, is ill peopled in proportion to its size; it contains only four thousand five hundred inhabitants. The streets and houses are well built; the finest edifices are the ducal castle and episcopal palace. Its academy, gymnasium and lyceum are richly endowed. The trade of Constance was formerly more considerable than at present; it consists of wine and grain, linen and wood.

The government of Baden may be commended for its enlightened views, to which the prosperity of the state must in a great measure be attributed. Judicious retrenchments have been proposed and enforced. The public funds are

^e "In the suburb of Bruel."

not wasted in encouraging a spirit of speculation, as fatal to national welfare, as gambling is to individual happiness. But although such projects are always opposed, the administration is not averse to any plan by which the wants of the people may be diminished. An inhabitant of Carlsruhe, animated by that philanthropic zeal which can excite men to good and generous actions, persuaded his townsmen in 1824 to raise a fund for the foundation of a workhouse, where every artisan without employment might find occupation, and every unfortunate person, skilled in any branch of industry, might obtain the means of subsistence.^a The government promoted the accomplishment of the plan, and unless it had done so, the efforts of the inhabitants might have been unavailing. The public authorities have also approved and encouraged the measures taken by a number of wealthy merchants, clergymen and other citizens, to assist and find employment for the poor throughout the country.

Other interests of a more general nature have not escaped the attention of government. By a treaty made in 1824, between the grand duchies of Baden and Hesse, the utmost freedom of trade was established, and consequently with all the states in the confederation.^b The object of the treaty was to extend the commercial intercourse of the two principalities with foreign countries, and to facilitate the circulation of commodities by removing the restraints which shortsighted statesmen have judged necessary for the prosperity of nations. Although the effect of these changes has been to unite the interests of the two grand duchies, similar changes have not been introduced into other countries—still it is no uninteresting spectacle to see these secondary powers set the world an example of that harmony which renders unnecessary expensive revenue establishments on the frontiers and coasts of different countries, establishments that tend only to encourage fraud, and prevent the inhabitants of civilized nations from enjoying the mutual advantages of their industry.

The principalities that remain to be mentioned, are not of much importance; they may be therefore briefly described. According to some genealogists, the family of Hohenzollern has existed for more than a thousand years. But so many families in Germany claim a like antiquity, that their ancient origin excites neither interest nor surprise. The filiation of the family may be traced from Frederick Count of Hohenzollern, who flourished in the thirteenth century. The same house was afterwards divided into two branches,^c and their possessions were erected into principalities during the seventeenth century at the diet of Ratisbon. The two families are distinguished by the names of the towns in which they reside—Hechingen and Sigmaringen. Their territories are surrounded by the kingdom of Wirtemberg and the grand duchy of Baden.

The principality of Hohenzollern-Hechingen may be about sixty-four square miles in superficial extent;^d the population amounts to fifteen thousand inhabitants, almost all of whom are Catholics. The country abounds with sandstone, and calcareous rocks containing organic re-

mains. It is traversed by a part of the chain that extends from the Black Forest to the eastern extremity of Wirtemberg. The Zollerberg, one of the highest summits, is not more than 2600 feet^e above the level of the sea. The most of the heights are covered with trees. The revenues of the state are equal to 120,000 florins, and the contingent for the confederation amounts to a hundred and forty-five men.

Hechingen, the capital, is situated on a hill, the base of which is watered by the Starzel; it contains about 2600 inhabitants. The old castle of Hohenzollern rises on one of the heights in the neighbourhood. It was built in the fifteenth century on the site of the one which was destroyed by Henrietta, countess of Wirtemberg and Montbelliard. The building was founded with much pomp and solemnity; Nicholas,^f count of Hohenzollern, Philip, duke of Burgundy, Albert, elector of Brandenburg, Charles, margrave of Baden, and Albert, duke of Austria, carried silver trowels and hammers, and laid the foundation stone in 1460. A valuable collection of armour may still be seen in one of the halls.

Hohenzollern-Sigmaringen lies to the south of the last principality; its surface and population are greater; Crome makes out the former to be equal to three hundred and twelve English square miles, and Hassel supposes the latter equal to thirty-eight thousand inhabitants.^g The soil belongs to what German geologists have termed the secondary and tertiary formations. The country for the most part is unfruitful, but some of the vallies yield rich harvests. The revenues amount to 300,000 florins, and the prince furnishes a contingent of 370 men to the confederation.

Although Sigmaringen^h on the Danube is the residence of the prince, it contains only eight hundred inhabitants. Haigerloch, the only town in the principality, for all the other places are burghs or villages, stands on a hill, at the foot of which flows the Eyach. The population amounts to 2000 individuals.

Lichtenstein,ⁱ one of the smallest principalities in Germany, does not contain more than five thousand eight hundred persons, who inhabit a surface of thirty-six square miles.^k The revenue does not exceed 50,000 florins,^l and the state furnishes a contingent of fifty-five men. It is situated on the banks of the Rhine, at the distance of nearly fifteen miles^m from the lake of Constance. The house of Lichtenstein is descended from Azo IV. of Este, who died in the year 1037. It possessed seventy-three seignories during the succeeding centuries;ⁿ and it still possesses under the sovereignty of Austria and Prussia two considerable principalities, those of Troppau and Jägemdorf, together with other territories in Silesia and Austria, of which the total population is not less than 324,000 inhabitants, and of which the revenues amount to 1,500,000 florins.^o The prince is thus enabled to maintain the rank of his ancient family.^p

Vadutz, a burgh on the banks of the Rhine, contains seven hundred souls. The castle of Lichtenstein, where the prince resides, rises in its immediate vicinity.

BOOK CXXIII.

EUROPE.

Europe Continued.—Germany.—Seventh Section.—Kingdom of Bavaria.

THE ancient dutchy of Bavaria, one of the largest of the German principalities, was the one, according to Hassel, that maintained the most numerous army. Having since been erected into a kingdom, it obtained by the last treaties additional territory, but the inhabitants have derived more important advantages from an enlightened and economical government. It is bounded by the kingdom of Saxony, ducal Saxony, and electoral Hesse, on the north; by the grand dutchies of Hesse and Baden, and by the kingdom of Wirtemberg, on the west; and by the states of the Austrian empire on the south and east. The superficial extent of the territory on the east of the Rhine is reckoned equal to 1359 German geographical square miles, or not less than 22,662 English square miles,^a but if the recent additions on the left bank of the Rhine be included, it will amount to 1499 German or 25,002 English square miles.^b Adhering to the same plan that was followed in the account of Prussia, the whole territory between Austria and Wirtemberg, shall be considered as forming the kingdom of Bavaria proper; after having made some remarks on its physical geography, and entered into the statistical details connected with it, we shall proceed to examine separately the Bavarian province on the banks of the Rhine.

Bavaria proper comprehends almost the whole country enclosed by the Rauhe-Alb and the Spessart on the west, by the Rhœne-Gebirge, the Thuringer-Wald, the Franken-Wald and the Fichtel-Gebirge on the north, by the Bœhmer-Wald on the east, and by different heights connected with the Alps on the south. That extensive region is naturally divided into two parts or basins; the Regnitz waters the first or the northern which forms the basin of the Maine. The mountains which enclose it on the south, consist of two chains or branches that extend from the place where the Regnitz rises; the one, or the Frank-Hœhe, bends to the right, and unites with the Fichtel-Gebirge; the other, or the Steiger-Wald, reaches nearly to the chain of the Spessart, from which it is only separated by the course of the Maine. The principal declivity of the basin is from south to north, and the Regnitz follows the same direction, before it unites with the Maine. The southern basin or the larger of the two is traversed by the Danube, and is formed by the Frank-Hœhe and Steiger-Wald and the other

mountains that have been already mentioned. The heights that rise on the north of the river are much less important than those on the south, and consequently the streams it receives on the left, are by no means so large as the feeders that enter on the right or opposite bank. The three largest rivers on the left side are the Altmühl, which descends from the Steiger-Wald, the Nab, which flows from the Fichtel-Gebirge, and the Regen, which has its source in the Bœhmer-Wald. The rivers, like the mountains on the right bank, are more important; the largest are the Iller, the Lech, the Isar or Iser, and the Inn, all of which have their sources in the Alps. The principal declivity in the basin inclines to the north-east; the different ramifications of the mountains enclose wide vallies or low and humid plains. The most extensive of these plains, or the one between Ratisbon and Osterhofen, is about forty-five miles^c in length, and nearly as many in breadth.

Thus, the basin of the Danube marks distinctly the separation of two great mountain ranges, that of the Alps on the south of the river, and that of the Hercynio-Carpathian mountains on the north; a separation which we have already had occasion to observe in the chapter on the physical geography of Europe.^d It is unnecessary to mention a second time the height of the Alpine summits, which, like the Watzmann and the Hochvogel, rise above the mountains in the south of Bavaria;^e but it may be remarked that the Bœhmer-Wald and the Fichtel-Gebirge on the eastern limits, vary in height from three thousand to upwards of five thousand feet.^f

The general arrangement of these mountains has been described in a former book;^g but it may be requisite to give a more minute account of the Spessart, Rhœne-Gebirge and Bœhmer-Wald in order to complete the physical geography of Bavaria.

The chain of the Spessart commences on the banks of the Maine, at the place where the course of the river separates it from the chain of the Oden-Wald. The extremity nearest to the Maine bears the name of Engelsberg; it extends to the north, giving off branches to the south-west and south-east, and joins the Rhœne-Gebirge; different streams, most of which are tributary to the Maine, descend from these heights. The mean elevation of the chain is about thirteen hundred and thirty-six feet; some of the mountains, however, are considerably higher; the Hohe-

^a "3,778 leagues."

^b "4,167 leagues."—The English sq. miles in both these instances, are obtained by multiplying the French leagues by six, and are of course much too small. Present superficial extent 32,000 sq. miles. (*Morse.*)—P.

^c "15 leagues."

^g Book CXVI.

Wart rises to the height of two thousand feet, and the Geyersberg, the loftiest in the range, to two thousand and eighty.^a

Volcanic rocks are observed in the Spessart, but the most frequent are granite, gneiss, sienite and porphyry, which serve as a support for sandstone, limestone and beds of clay. Veins of copper, cobalt, lead and iron are found in the primitive, but oftener in the secondary rocks. As to the form of the mountains, the most of them are rounded, and their gentle declivities extend to a considerable distance; it is only in the neighbourhood of Aschaffenburg, that the stranger observes steep rocks and pyramidal summits.^b

The Rhœne-Gebirge is more extensive than the Spessart; it unites on the west with the chain of the Vogelsberg, and on the east with that of the Thuringer-Wald. Its mean elevation exceeds that of the Spessart, and it furnishes two feeders to the Maine,—the Sinn and the Saale. Granite rocks rise at the western extremity, on the declivities of which lie rocks of secondary limestone, and above these various deposits of basalt.

The Fichtel-Gebirge, which connects the Rhœne mountains with the Bœhmer-Wald, consists chiefly of granite; the highest point in the range is the summit of the Ochsenkopf. Two small rivers descend from the Fichtel-Gebirge, to form the Maine; the inhabitants call one of these streams the White Main; the other, or the Red Main, flows to it from the south. The bed of the former at Culmbach has been found to be a hundred and thirty-six feet higher than the bed of the latter at Bayreuth. The declivity in the basin of the Maine from east to west is considerable; from Bayreuth to Wurtzburg, a distance of nearly sixty miles,^c it is upwards of six hundred feet.^d

The chain of the Bœhmer-Wald joins the Fichtel-Gebirge; it commenced at the sources of the Eger, and terminates at the Moravian mountains, which shall afterwards be more fully mentioned. The Bœhmer-Wald may be about two hundred miles in length; its breadth on the north-west may vary from fifteen to twenty near the centre, and from twenty-four to more than thirty on the south.^e It rises gradually from the northern extremity to the neighbourhood of Waldmunchen; the highest point is situated near Swiesel, and the chain becomes gradually lower, until it unites with the Moravian mountains. The most elevated summits are the Arber, the Rachel and the Dreysel.^f The range is very steep on the side of Bavaria, but much less so towards Bohemia. Several branches extend from it into the former country, the most important of which are the Greiner-Wald and the Bayer-Wald; the first rises near Waldmunchen, and the Regen, a feeder of the Danube, flows along its southern declivities; the second reaches from Mount Rachel to the neighbourhood of Ratisbon, and separates the course of the Danube from that of the Regen. The last is not the only river that has its source in the

Bœhmer-Wald, and follows the declivities in the basin of the Danube. Several of the streams which form the Nab, flow from the same range and that of the Fichtel-Gebirge, and the Ilz rises from the base of mount Rachel. The basis of the Bœhmer-Wald is composed of granite, which supports masses of gneiss and micaceous schistus. One may observe on these heights deep cavities and numerous marshes; the naked summits resemble needles or pyramids, and the forests that stretch along the declivities afford shelter to the lynx and the bear.

Two distinct geological formations are separated in Bavaria by the course of the Danube. The country on the north of the river, including the basin of the Regnitz and the Maine, is of secondary formation, comprehending oolitic limestone, muschel-kalk, zechstein and other analogous rocks, as well as variegated sandstone, quadersandstein and other quartzose deposits. Vast tertiary deposits extend on the south of the river, from the lake of Constance to the confluence of the Inn and the Danube; they rest on rocks of earlier formation, which are supported by the granite that belongs to the chain of the Alps.

The alluvial lands on the north of the river are of an earlier formation than those in southern Bavaria; geologists have discovered in them the bones of the animals that inhabited our planet at a time when its climate and productions rendered it unfit for the residence of man. Fossil bones of the tapir and rhinoceros have been found in the valley of the Regen, crocodiles have been discovered in the calcareous schistus in the valley of the Altmühl, and the remains of elephants, which must have been much larger than any that exist at present,^h have been collected near Schweinfurt and Arnstein in the valley of the Maine. Some caverns in the Steiger-Wald are filled with the bones of lions and hyenas; the remains of animals now wholly extinct may be observed in other places; in short, it is difficult to mention a more interesting country than Bavaria to those who are engaged in the most attractive department of natural history.

The highest and most southern portion of Bavaria is exposed to the influence of the Alps. The lakes are numerous, and some of them are large; thus, besides the lake of Constance, a very small part of which is situated in the kingdom, eight others of considerable extent might be mentioned. The largest are the Ammer, the Würm and the Chiem. A river of the same name issues from the first, and throws itself into the Isar. The Alza, a feeder of the Inn, flows from the Chiem. The others that may be enumerated, are the Staffel, the Kochen, the Walchen, the Tegern and the Bartholomæus or royal lake. These lakes, and many more of a smaller size, are not without their value to the inhabitants; several fisheries have been established on them, and a lucrative branch of industry has thus been produced.ⁱ

The most frequented mineral springs in Bavaria are those of Sichertersreuth^k in the picturesque country of the

^k Or Alexandersbrunnen. (Hassel.)

Fichtel-Gebirge, the baths of Kissingen situated in a valley watered by the Saale, about thirty-two miles north from Wurtzburg, the acidulous and ferruginous springs of Bocklet and Brückenau, in the same part of the country, and those of Hardeck in the southern part of the kingdom, from which Munich is supplied with mineral water.

The climate on the whole is temperate and salubrious; the elevation of the soil, and the neighbourhood of the mountains occasion however considerable modifications in the temperature. The air is keen in the countries to the south of the Danube, the winters too are long and severe; but that region is the highest of any in Bavaria, and the most exposed to the influence of the eternal glaciers on the Alps. The prevalence of the north-east winds renders the climate cold and dry throughout the Böhmer-Wald. Much rain falls in many places during the spring, and the heat of summer is sometimes excessive in vallies having a south exposure. The autumn, in general, is the finest season in the year.

Before we make any remarks on the natural productions, agricultural wealth and commerce of Bavaria, it may be proper to give some account of the ancient people, who occupied the country. It was formerly inhabited by two nations that were separated from each other by the Danube. The *Hermunduri* possessed the lands on the north of the river, and the country on the south was peopled by the *Vindelici*. The *Narisci*, a people less important than either of the two former, were settled in the country that extends from the declivities of the Böhmer-Wald or Bohemian forest^a to the banks of the Danube, and from the mouth of the Nab to that of the Ilz.

The *Hermunduri*, according to Tacitus, adored Mars and Mercury; they were often engaged in contests and bloody wars with the *Catti*, their northern neighbours. Their enemies were devoted to the gods, and if they proved victorious, all the vanquished, men and horses, were slaughtered without remorse.^b The same people yielded however to the arms of the Romans, and became their most faithful allies. Thus they were the only German people that were permitted to travel freely through the neighbouring colonies. While, continues the historian, other nations are only allowed to see our arms and camps, our town and country houses are open to the *Hermunduri*.^c

The *Narisci*, who, according to Tacitus, inhabited a country in the neighbourhood of the last people, were not inferior to them in bravery and courage.^d The ancients have left us but little information relative to the *Narisci*; nothing remarkable concerning them is mentioned by Ptolemy or Dion Cassius; it may however be observed that the first of these writers calls them the *Varisti*, and the second the *Narista*.

The *Vindelici* were scattered over the country which extends from the lake of Constance to the confluence of the Inn and the Danube; the last river served them for a boundary. According to D'Anville,^e the *Vindelici* were so called from two rivers, the *Vindo* or the modern Wertach, and the *Licus* or the modern Lech. As they were settled on the banks of these rivers from the remotest antiquity, such an etymology does not appear improbable. The *Vindelici* were subdued by the Romans, who, after their subju-

gation, called the country *Vindelicia*; it was at a later period joined to *Rhætia* (*provincia Rhætia*), where several Roman colonies were settled.

The most important of these settlements appears to have been the *Augusta Vindelicorum* or the present Augsburg, which according to different documents formed *Oppidum Augusti*, or the town of Augustus.^f *Cambodunum*,^g another place of some consequence, was probably built on the site of Kempten. Ratisbon on the Danube, the German Regensburg, was the ancient *Regina*, a name derived from the Regen, opposite the mouth of which it is situated. Passau was the former *Batava Castra*, and Neu-Oetting near Muhlendorf seems to have been the *Pons Æni*, an opinion confirmed by the remains of a Roman way situated in the neighbourhood.

Bavaria is the most ancient duchy in Germany; it has retained its name, title, and even part of its constitution, since the fifth century. The Germans call it *Bayern*, a name which has probably some connexion with that of the *Boii*, an ancient people, who were driven into Bohemia by the Romans, and who left that country about the middle of the fifth century along with the barbarians that have been denominated Ostrogoths.

Aldiger or Aldeger is believed to have been the first chief or duke of the Bavarians; he formed the design in common with other German princes, of accompanying Clovis, and sharing his conquests; but after the victory at Tolbiac, Clovis confined the Germans within their former limits, and compelled the Bavarians and their chief to acknowledge his authority. To diminish the chances of a successful revolt, a colony of Franks was settled in that part of Germany, which has since been called Franconia, and the dukes of Bavaria were made tributary to its sovereigns. The Bavarians began to embrace Christianity in the time of Theudo the Third, the grandson of Aldiger; in the sixth century, after the vast monarchy of the Franks was divided, they submitted to the kings of Austrasia.

The weakness of the last Merovingian kings enabled the Bavarians to shake off the yoke; the country retained its freedom until about the year 786, but at that period, Thassilo, a Bavarian duke of the Agilolfingian family, excited a rebellion in different parts of Germany, which was not quelled until Charlemagne marched against him, and forced him to acknowledge his sovereignty. Thassilo having revolted a second time in the following year, was cited before the diet at Ingelheim, accused of high treason, and condemned to death. But his punishment was commuted by Charlemagne, who deprived him of his dominions, and confined him first in the abbey of Lauresheim, and afterwards in the monastery of Jumiege. Thassilo, although a weak prince, became an excellent monk, and died with a great reputation for sanctity.

Charlemagne having made himself master of Bavaria, divided it into several counties, and appointed rulers and princes over them. The government of the same country was again changed after the division of the monarchy between the sons of Lewis I.;^h it fell, with all Germany, to the lot of Lewis the German, who chose Ratisbon for the place of his residence. The dominions of Lewis were

^h Louis the Debonnaire.

divided among his children, and Carloman became king of Bavaria. Arnold,^a the natural son of Carloman, succeeded his father, and was elected king of Germany.

Luitpold or Leopold was probably the first who was named Margrave of the country by the German kings in the ninth century. The dignity of count or duke of Bavaria was not hereditary, the emperors conferred it on different princes until the thirteenth century; at that time Lewis the Old, of the house of Wittelsbach, duke of Lower Bavaria, and count palatine of the Rhine, left two sons, Rudolph and Lewis, who were the founders of the Palatine or Rodolphine, and the Bavarian or Ludovician families. The lineal descendants of the Ludovician branch, retained the duchy of Bavaria, which was raised into an electorate in 1618, till it became extinct in the year 1777, and a collateral descendant of the palatine family^b is at present seated on the throne of Bavaria.^c

The soil in the higher parts of the kingdom, is of an ordinary quality, but the low plains and vallies are very productive. The soil in the northern districts is for the most part light; in the south it is heavy and fruitful. The Bavarian government is desirous of encouraging agriculture, but it will be necessary in the first place to overcome the ignorance and indolent habits of the peasantry, which are obstacles to every sort of improvement.

Nearly a third part of the territory on the Isar, the lower Danube and the Regen, is still uncultivated; within the last few years, marshes have been drained at the expense of government, and waste lands have been rendered arable. But as these operations are attended with a considerable outlay of capital, their accomplishment is retarded, although their utility has been always admitted. The differences, which are obvious in the productiveness of the same sort of land in a country under the same government, can only be attributed to the knowledge or ignorance of the agriculturists. A more improved system of cultivation than any other in Bavaria, may be observed in the circles of the Rezat, the upper Danube, and the upper and lower Maine; in the same circles too, the harvests are the most abundant. The produce, it must be confessed, is not so great as in lower Saxony and Flanders; still the inhabitants are industrious and not ignorant of their true interests. The above mentioned circles are the wealthiest in Bavaria, and the rich harvests that are reaped in them compensate in some degree for the deficiency in other parts of the country.

The circles of the upper and lower Maine, yield not only different kinds of grain, but wine and fruits. Agriculture, which was formerly neglected in the mountains of the Spessart, has made great advances of late years. Potatoes and bread form the principal food of the inhabitants. The harvests in some other districts, as well as on these mountains, hardly suffice for the annual consumption; it ought, however, to be mentioned, that government makes use of every means by which knowledge can be diffused among the people, and the Bavarians may ere long be sensible that the elements of their prosperity depend on the cultivation of their country.

The rearing of cattle forms, after agriculture, the principal source of territorial wealth; the meadows that extend along the banks of the rivers are well adapted for this pur-

pose. It may be remarked, that in those districts, where agriculture has arrived at a certain degree of perfection, care has been taken to improve the different breeds. Thus it appears that one branch of industry cannot be established without creating another. The plan of artificial irrigation practised with so much success, not only in the circle of the Rezat, but in those of the upper and lower Maine, has produced verdant and luxuriant meadows, in which numerous flocks and herds are fattened. It must be admitted that the breed of cattle might be still much improved, for it is obvious that little attention has hitherto been bestowed by the Bavarians on the form and proportions of these animals. If the oxen on the declivities of the Alps rival in symmetry any in the Swiss Cantons, it is equally true that the produce of the dairy and the rearing of cattle make up the chief wealth of the people in the elevated country that extends to the south of Munich. Many goats are fed in the same districts and in most of the mountains which bound the kingdom. The hog is fattened in almost every part of Bavaria, and in many places, the flesh of that animal forms the principal sustenance of the people.

The remarks that have been made concerning the Bavarian oxen, are much more applicable to the horses; the inhabitants appear to have been still less successful in improving the breed of that useful animal. The number of horses was considerably diminished during the last wars, and it has not been sufficiently increased since the peace. Although horses are seldom used for agricultural purposes, it must nevertheless be confessed that the government, by neglecting to multiply and improve them, renders itself, in the event of a war, dependent on foreign powers.

The landed proprietors pay great attention to their sheep; the native breed has been crossed with the Merinos, and other experiments have been conducted with much sagacity and corresponding success. If there be a greater demand for the cloth and woollen manufactures of Bavaria, it must be attributed to these causes.

The peasants in some districts have found the management of bees a very profitable employment, but that branch of rural economy was formerly more flourishing than at present, although the use of wax has now become more common. The circles of the Rezat and the upper Danube are most favourable for bees.

It may, on the whole, be concluded that the Bavarians have been surpassed by the inhabitants of other countries in two important branches of rural industry, in rearing cattle and other domestic animals, and in their method of husbandry. But it is rather to the quality than the quantity of live stock that their attention ought to be directed, for it appears from a statistical work published a few years ago, that the proportion of cattle to surface was as one for every five acres (*arpens*) of land. What has been stated concerning the system of agriculture may now be repeated; in both cases the ignorance and even superstition of the country people are the principal obstacles to improvement. So long as the peasants and farmers, neglecting the best means of curing or arresting the progress of contagious disorders among the lower animals, lead their diseased cattle to distant pilgrimages, it is vain to expect any amendment in whatever appertains to rural economy.^d

^b Of the house of Birkenfeld.

^c Historisch-Statistische Uebersicht sämmtlicher Provinzen und Bestandtheile des Königreichs Baiern, by J. Marx, baron of Liechtenstern.

^d More than eighteen thousand landed proprietors, farmers and pea-

sants,* went on a pilgrimage with their cattle to Griesbach in 1820, and nearly thirty thousand performed the same journey in the following year. See the work entitled: Ueber den Zustand des Königreichs Baiern, by M. Rudhart, director of the government of Ratisbon, 1825.

* "More than 18,000 cultivateurs."

The art of gardening has made some advances of late years, at least a considerable portion of ground has been laid out in nurseries and flower gardens; but it ought not to be inferred that horticulture has arrived at the same degree of perfection which it has attained in other countries. The culture of vegetables and culinary plants is principally confined to the neighbourhood of large towns.

It has already been observed that the vine is cultivated in the circles of the Rezat and the lower Maine. The wines of Franconia are produced in the latter circle, and the best vineyards are those on the Leiste and the Steinberg, and those in the vicinity of Saleck and Wurtzburg. The wines next to them in repute are those of Calmuth, Eiweilstadt, Sommerach and Eschendorf, and also those produced from the vineyards on the lake of Constance. It may be remarked that the culture of the vine is well understood in Bavaria.

The woods and forests are committed to the Bavarian government, and the care^a of them furnishes employment to several thousand individuals. The most ordinary trees are the oak and the beech; the first grows luxuriantly, and the second which is much more common, reaches in some places to the height of more than a hundred feet. The birch, the ash and several coniferous trees have been planted. The most extensive forests in Bavaria are those situated on the Spessart and the Rhœne-Gebirge, those of Zwiesler, Mitten, Kulwald, Retzer and Lorenz, and those in the neighbourhood of Kempten. Their superficial extent has been estimated at five millions six hundred and fifty-nine thousand acres (*arpens*.) It is calculated that they occupy a twenty-ninth part of all the land in the kingdom, which gives the proportion of nearly eight acres (*arpens*) for every family.^b

The ignorance of the country people is not the only obstacle to the measures contemplated by government for advancing the welfare of the landed interest. The plans proposed by government have been counteracted by different feudal institutions, tithes, baronial rights, the privilege of hunting, and different services exacted from the peasantry. These and other customs equally antiquated, have hitherto been maintained by those who profit by them. It is in vain that every man has been permitted by a recent law to use his property as he pleases; so long as feudal burdens continue, so long as the greater portion of the inhabitants are degraded by servile duties, land must be almost an illusory possession. The freedom of agriculture has been proclaimed in vain; if the woods are under the management of persons appointed by the government, if the culture of the vine is subject to regulations that emanate from the same quarter, if the nobles are permitted to examine whether the lands of the other proprietors are well or ill cultivated, and to propose alterations, agriculture will continue in its infancy.

Many changes must be introduced before the country can be improved; the land must be more equally divided; the waste lands, and part of the forests, which are too extensive, must be freely granted to those who undertake to bring them into cultivation; nay, the new proprietors must be exempt from every tax and contribution for a greater or

less period according to circumstances, and even premiums should be granted them for their encouragement. Such of the pastures as are too poor to be of much use in fattening cattle, should be improved by cultivation. The right of pasturing on the property of others, or of passage over it, should be abolished. The inhabitants should be encouraged to provide the best sort of food for their cattle, and to prevent them from being exposed day and night to the inclemency of the weather. The woods in the fertile meadows which are suffered to remain only because they serve to shelter game, should be removed. The legislature should not fix the *minimum* of landed property that a man can possess, nor hinder any one from building a house on his land, if it does not amount to a certain number of acres. It is obvious that until these reforms shall be introduced, the country can never be in such a state of prosperity as it might be expected to attain, considering the nature of the soil and the industry of the inhabitants.^c

Many quarries, containing different kinds of stone,^d are worked in the country; there are also mines of coal, lead and copper; but all these minerals are of little value, if compared with the products of the salt works and iron mines. The most abundant saline springs are those situated in the circle of the Isar, and those of Reichenhall, Traunstein and Rosenheim; they yield annually about four hundred thousand quintals of salt; the mine at Berchtesgaden furnishes more than a hundred and fifty thousand, another at Orb twenty-four thousand, and a third at Kissingen, sixteen thousand; but in order to supply the wants of the population, government, in consequence of a special treaty, receives every year from Hall two hundred and sixty thousand quintals of salt, which, after the necessary process of purification, is reduced to a hundred and ninety thousand.

The iron mines in the territory of Amberg yield from forty to fifty thousand quintals, those in the circle of the Upper Maine from eighty to ninety thousand, those in the circle of the Isar near the heights of Kressen, about a hundred and twenty thousand, and those in the other parts of the country about twenty thousand; so that the whole produce throughout the kingdom amounts to nearly three hundred thousand quintals.^e The circle of the Upper Maine is the only one in Bavaria proper in which coal is worked, but the quantity obtained does not exceed 35,000 quintals, or not much more than a third of what is extracted in the circle of the Rhine.^f

The different branches of manufacturing industry are in a still less advanced state than agriculture; there are however sixteen iron works, several manufactories of iron wire, and two of fire arms. The moderate degree of perfection to which some of the arts have attained, has been partly the effect of rewards and encouragements given by government. Coarse linen can only be manufactured in the country; all the fine linens are imported. The same may be said of woollen stuffs and different kinds of cloth, which form a considerable branch of importation. Cotton goods and hosiery are manufactured in different parts of Bavaria for home consumption.^g

It may be allowed that in some articles, the Bavarians

^g The linens, woollens, cottons and hosiery, manufactured in Bavaria, are principally consumed in the country. (Hassel.)—P.

have acquired a decided superiority over their neighbours; thus the different kinds of leather which they manufacture, are exported, and Saxony is partly supplied with paper from the same country. The musical, surgical and mathematical instruments made at Munich, are sold in many parts of Germany, and the playing cards of Nuremberg are exported into different countries in Europe and America. The glass, porcelain and earthen works in the kingdom, suffice for the supply of the inhabitants. The cambric and lace manufactures are too insignificant to require notice. It ought to be mentioned that the administration, anxious to correct gradually all the abuses connected with the ancient government, encouraged industry by abolishing in 1827 the offices of wardens and masters in the different corporations.

It follows from what has been already said, that the commerce of Bavaria cannot be very important. Fortunately for the country, its situation enables the inhabitants to communicate with different states, and by this means puts them in possession of a considerable carrying trade.

There is only one navigable canal in the kingdom, which opens a communication between the Rhine and the valley of Franconia. Another canal, which was begun by Charlemagne, in order to connect the Rhine and the Danube, and which has since been recommenced at different times, is not likely to be ever finished.^a Commercial transactions are facilitated by the course of the principal rivers, such as the Danube, the Rhine, the Maine, the Regnitz, the Inn and the Salzach, by numerous and well kept roads, that extended in 1812 more than a thousand and eighty German miles, or nearly four thousand three hundred and ten English miles,^b and lastly by the posts, which although expensive, are very expeditious.

The corn trade was in a flourishing state a few years ago; it has since been destroyed by the restrictions imposed on it by government. It may excite surprise that so few statesmen are acquainted with the most elementary truths of political economy. It is not wonderful that the vulgar confound corn merchants with forestallers, eager only to occasion famine or to enrich themselves at the expense of the people, but it is painful to confess that the same prejudices are common to them with men called to the government of kingdoms. It might almost be inferred that Smith, Say, Condillac and other great economists, had written in vain, if such men are ignorant that products of every kind belong to commerce, and that commerce must be free in order to be advantageous to the community.

The Bavarian ministers have at last begun to encourage inland navigation, and vessels constructed at the expense of the state, now sail on the Danube; the example of government will without doubt be imitated by capitalists; the Isar and the Maine covered with vessels of the same sort, or with steam boats, will one day facilitate the transportation of agricultural products, which under a better system must form the principal wealth of the country.^c

Less accurate information has been obtained concerning the population of Bavaria, than of any other state in Germany; a census however was made in 1822, and according to it, the number of inhabitants amounted to 3,566,300. Hassel cannot be supposed to have been ignorant of that

census; still in his statistical tables of the same year, he estimates the population at 3,630,800.^d An author, well known for his accuracy, has concluded from new data and other calculations that the number in 1827 was equal to 3,940,000.^e If these different results be correct, the population in Bavaria must have increased in a very rapid progression, for the difference in five years exceeds 350,000 individuals. The inhabitants in the circle of the Rhine are included in the numbers that have been now stated; but the population of Bavaria proper amounted probably in 1827 to 3,510,000 individuals, and at least four fifths of them were catholics.

The tables at the end of this book are so full as to render further details unnecessary: one observation may however be made, and it is that no civil restrictions on account of religion are imposed on the people in Bavaria. Catholics, Lutherans and Calvinists enjoy the same rights; government never interferes in questions connected with the forms of worship or the religious opinions of the different sects. According to the last concordate, the kingdom is divided into two archbishoprics, the one at Munich, the other at Bamberg, and into six bishoprics, those of Passau, Ratisbon and Augsburg, and the suffragan bishoprics of Eichstedt, Wurtzburg and Speyer. The protestants acknowledge the general consistory at Munich as their highest ecclesiastical court; and the Israelites are under the authority of their rabbis, whose nomination must be approved by government.

The Bavarians have retained some characteristic traits of the different people from whom they are descended. The inhabitants of ancient Swabia are sober, but ignorant and superstitious; the Franks or the people of ancient Franconia, are lively, cunning and enterprising; the Bavarians proper, sprung from a mixture of the *Vindelici* and the *Bœii*, are grave, loyal, faithful to their engagements, constant in their affections, attached to the ceremonies rather than the duties of religion, and ready to make any sacrifice for their country, if the priest commands it in the name of the Divinity.

The state of society is not so unexceptionable as might be imagined; the vices in the great towns are but too evident, and they may be easily accounted for; but the number of natural children in the country and even in the mountainous districts, announces a degree of corruption, that may perhaps be chiefly attributed to the ignorance of the inhabitants.

Government, convinced of that important truth, has at length made some attempts to provide for the instruction of the people. An elementary school has been established in every parish; the time may come when there will be one in every village, and when even the inhabitants of the hamlets may participate in the benefits of education. The higher orders of society possess greater advantages in this respect; lycæums, colleges and universities have been established in several towns, but their number is not sufficient for the wants of the middling classes, which in Bavaria may rank among the most enlightened of Europe.

What has been said of the character and education of the Bavarians, leads us naturally to consider their constitution, for it is found that knowledge may be most easily dif-

too small for the common German mile of 15 to a degree. It should be nearly 5000.—P.

^c Wochenblatt des Landwirthschaft. Vereins in Baiern, 1823.

^d Statistischer Umriss der sämtlichen Europäischen Staaten, 1823.

^e M. A. Balbi, Balance politique du globe.

^a It is not stated in the original that it has ever been recommenced. "Scarcely a trace exists of the canal dug by Charlemagne, in order to connect the Rhine and the Danube." (Hassel.)—P.

^b "1793 leagues."—The extent in English miles in the translation, is

fused among the people under constitutional governments. According to the constitutional act passed on the twenty-sixth of May, 1818, Bavaria forms an indivisible kingdom; the domains of the state cannot be alienated, the crown is hereditary, and the person of the king inviolable. There is no civil list,^a the king determines the expenses of his household,^b and the princes receive for their appanage a sum that has not hitherto exceeded 150,000 florins. The revenue of the queen mother has been fixed at two hundred thousand, and each princess receives a hundred thousand for her dowry.

The general assembly of the states consists of two chambers. The princes of the royal family, the great officers of state, the two archbishops, some of the nobles, a bishop nominated by the king, and the president of the protestant consistory, are members of the upper chamber. The king has it besides in his power to appoint hereditary members or members for life; the number of the latter cannot exceed a third of the former.^c The chamber of representatives consists of a hundred and fifteen members;^d fourteen are chosen by the nobles,^e as many by the clergy,^f twenty-eight by the burgesses, and fifty-six by the landed proprietors; the universities appoint the remaining three, who must belong to the Catholic, Lutheran or Calvinistic communions, and who cannot be elected before the age of thirty. The number of representatives is proportioned to that of families, so as to allow one of the former to seven thousand of the latter: the members are chosen every six years. The executive power is in the hands of the king, and the ministry consists of five members.^g According to the fundamental law of the state, no one can be imprisoned or condemned but by the sentence of a judge, all the citizens are eligible to the different offices of state, and all are obliged to enter the military service.^h

It may be superfluous to make any remarks on the merits or imperfections of the constitution, since at the time it was enacted, the necessity of some modifications was acknowledged. While some writers hailed it as the dawn of freedom in Bavaria, others considered it very imperfect. "The Bavarians," says M. Hazzi,ⁱ "can derive but little advantage from the abolition of personal slavery, while a magistrate, in the plenitude of his power or caprice, can inflict corporal punishment on the burgesses and peasants, and while an officer can degrade his soldiers in the same manner. The condition of the husbandmen can never be improved, so long as compulsory labour, different services and every sort of feudal burden, are imposed on them. It is of little use that a vague law entitles any individual to purchase exemption from such hardships, since there is no law by which the purchase money has been fixed. Religious liberty has been declared a fundamental principle of the constitution, but the Menmonites, Moravians, Anabaptists and Jews, all those, in short, who are neither Catholics,

Calvinists nor Lutherans, are deprived of political privileges. A Bavarian is not permitted to emigrate without the consent of government, and then it must be to one of the confederated states; if he does so of his own accord, his property may be confiscated."

The king is grand master of the five orders of knighthood in Bavaria, viz. those of Saint Hubert, Saint George and Saint Michael, the military order of Max-Joseph, and the civil order of Merit.

The Bavarian army corresponds with the rank which the state holds in the Germanic confederation. The conscription still exists, and the military force of the kingdom consists of fifty-four thousand men, besides a numerous reserve, and a national guard (*landwehr*.) The contingent to the confederation has been fixed at thirty-five thousand; the period of military service is limited to five years. The troops for the protection of the country are trained after the manner of the French gendarmes.^k A military establishment so disproportionate to the number of inhabitants, can only be maintained by measures so severe as to be hardly supportable except in time of war. Every able-bodied man must enter the army, either in the active service, the reserve, or the national guard.

The revenue of Bavaria amounts to about 35,000,000 florins, and the national debt to more than 110,000,000.^l These results are not very satisfactory, but what has been lately gained by economy and retrenchments not only in the expenditure of the state but of the court, cannot fail to improve the finances of the kingdom. The promises of government, which have been already realized in this respect, may be considered a pledge that others made from the throne at the opening of the session in 1828 will also be fulfilled. The sovereign has publicly declared his intention to establish provincial councils, to render the administration of government and of justice less expensive, to apportion the taxes and imposts more uniformly, to enter into commercial treaties with neighbouring nations, to render public the debates and proceedings in the different courts and assemblies, and lastly, to introduce a new penal code adapted to the presents wants of society. Such resolutions are the best guarantee of the future prosperity of the kingdom.

Bavaria is divided into eight circles, namely, those of the Isar, the Lower Danube, the Regen, the Upper Maine, the Rezat, the Upper Danube, the Lower Maine and the Rhine. The last circle shall be described separately, as it forms no part of Bavaria Proper.

Munich,^m the capital of the circle of the Isar or Iser, is also the capital of the kingdom. It rises in the middle of an extensive plain between the heights of the Isar and the Galgen. It occupies nearly the same extent of ground as Vienna, if the suburbs of the latter be not taken into account, and it has been considered one of the finest cities in Germany. It stands on the Isar, at the height of more

^a The amount of the civil list has been fixed at 2,745,000 florins. (Hassel, 1822.) ^b "The allowance (*pin-money*) of his queen." (M.B. Hassel.)

^c "That of councillors of the kingdom (*Reichsräthe*) consists of the princes of the royal family (of full age,) the four great dignitaries of the crown (*Kronbeamten*), the two archbishops, the heads of the principal noble families (*standesherrn*), one of the bishops appointed by the king, the president of the protestant consistory, and such other persons as the king may designate, either as hereditary members or as councillors for life; but the number of the latter (councillors for life) cannot exceed a third of the hereditary members."

^d The number in 1818. But the number varies with the population. The rule of apportionment is $\frac{1}{3}$ to the possessors of seignorial estates, $\frac{1}{3}$ to the other landed proprietors, $\frac{1}{3}$ to the clergy, $\frac{1}{3}$ to the cities and market towns, and 1 member to each of the three universities.—P.

^e Possessors of seignorial estates (*gutsbesitzer*.)

^f Nine by the Catholics, and five by the Protestants.

^g The two great central authorities (*centralbehörden*) are the ministry, consisting of five members, (viz. the ministers of foreign affairs, of justice, of the interior, of finance, and of war,) and the council of state.—P.

than nineteen hundred feet^a above the level of the sea. It cannot be called a regularly built town; modern houses are placed near edifices which have stood for more than four hundred years; it must be admitted however that several streets are broad, straight and well paved. The number of houses amounts to three thousand one hundred and eighty, and the population to sixty-five thousand individuals. The public squares contribute chiefly to the embellishment of the town; the most remarkable are those of Max-Joseph, Anger and Maximilian, the Place of Arms and the Promenade, the last of which is surrounded with trees and arcades. The public buildings are the royal palace, the palaces of Max and William, the house in which the chambers meet, another that serves as a residence for the minister of the interior, the town-house, the new mint, the two principal theatres, and the academy of sciences, formerly the college of the Jesuits, and the finest of any that the order possessed in Europe.

The royal palace may be styled a model of architecture; it is highly magnificent in the interior, and so extensive, that it was a common saying in former times, that all the kings in Christendom might reside in the palace of Munich. Many valuable curiosities are to be seen in the court chapel, among others a painting by Michael Angelo, the small altar at which Mary Stuart performed her devotions, when in prison, a reliquary adorned with ancient cameos, a pearl of the greatest beauty, known in Europe by the name of the palatine pearl, and lastly a piece of native gold, weighing more than twenty-two pounds. Among the collections in the royal palace, are the cabinet containing a hundred and thirty miniatures, which have been valued at more than £30,000,^b and the Maximilian gallery, in which there are several paintings by the greatest masters.

It may be sufficient to mention one of the twenty-two churches, that of St. Mary, otherwise called *Frauen-Kirche* or the church of Our Lady; not fewer than thirty altars are contained in it; its finest ornaments are several valuable paintings and a mausoleum of the emperor Lewis of Bavaria. The two steeples of the same building rise to the height of three hundred and thirty feet; it may be easily inferred that they command an extensive view; hence most strangers who visit the town ascend them.

The public collections of Munich are highly valuable; more than thirteen hundred paintings by celebrated masters are contained in the royal gallery and there is a fine collection of drawings and mosaics in the ancient convent of the Theatins. The number of volumes in the royal library exceeds four hundred thousand, and amongst them are eight thousand five hundred manuscripts, and more than twenty thousand volumes, published when the art of printing was still in its infancy. One of them is a bible by Guttenberg and Faust, printed in the year 1450. More than ten thousand Greek and Roman gold coins form part of the cabinet of medals; the museum of natural history, the botanic garden, the observatory, and the schools of chemistry and anatomy, contain whatever is useful in such institutions.

Among the public seminaries in Munich, are the royal institute consisting of four different schools, the philological school, the school of medicine and surgery, the central veterinary school, the seminary set apart for poor students from all the towns in the kingdom, the school for cadets and that for the pages of the king, the Maximilian boarding

school^c for the daughters of the nobles, and different elementary and gratuitous schools.

It might be easy to enumerate several establishments for the relief of the indigent, hospitals for the old and infirm of both sexes, and others for orphans, foundlings and lunatics. It may be remarked too that most of these establishments were founded by pious and philanthropic inhabitants of the town; some have existed for nearly four hundred years, and since that period, virtuous citizens, guided by the purest philanthropy, have used their utmost efforts to mitigate wretchedness and misfortune, without being in any way assisted or encouraged by government. Now, that their example is followed by the state, the means of relief are greater, the repression of mendicity more effectual; indeed travellers have declared that fewer mendicants are to be seen in Munich than in any other town of the same size in Germany. It rarely happens that the children of the lower orders accustom themselves early to indolence, by depending for a subsistence on the alms which their importunity extorts. The children who are found begging in the towns or in the country, are removed from that degrading state, the source of so many vices, and educated at the public expense, until they are able to support themselves by their labour. Houses of correction have been built for the confinement of vagrants; in short, it may be sufficient to terminate the account of the charitable institutions in the capital, by stating that the plan proposed by Count Rumford, an individual to whom humanity is so much indebted, has been realized at Munich. Food is gratuitously provided for six hundred persons, in an edifice erected for the purpose. A secret passage leads to the interior of the building; those who wish to conceal their poverty from their fellow citizens enter it, and receive, without being seen, a sufficient quantity of wholesome provisions. It has been affirmed that respectable individuals, victims to the vicissitudes of fortune, are thus better enabled to endure the hardships of poverty.

The two most celebrated academies at Munich, are the academy of arts, and that of sciences. The latter is divided into three classes; the first, or that of philology and philosophy, consists of six members and one associate; the second, or that of the mathematical and physical sciences, consists of thirteen members and two associates; and the third, or that of history, consists of eight members. Each class has its secretary and honorary members. The king is the patron, and there is besides a general secretary of the whole academy. The academy of arts consists of a director, a secretary, and eight ordinary, thirty honorary and forty corresponding members.

The residence of the court at Munich is the means of furnishing employment to many inhabitants; others are provided for by government offices. The manufactures of the town, are cloth, leather, hardware goods, jewellery and tapestry, the last of which has been considered little inferior to that of the Gobelins. Although there are several fairs every year, and corn markets every week, the trade of Munich has not risen to much importance. The castle of Nymphenburg, a royal residence at a league to the north-west of the capital, is built after the model of the one at Versailles, and the grounds are laid out with great taste.

Landshut on the Isar, is, after Munich, the finest town in Bavaria; its name signifies the hat of the country,^d and it was in feudal times a place of protection for the people

^a "Elevation 1920 feet"—1569 Fr. feet (Table of Altitudes, Book CXIV. of the original.)

^b "600,000 francs."

^c The Maximilian Institute.

^d Qu. *land*, country, and *hut*, guard.—P.

against the exactions of the barons. It stands on the declivity of a hill, commanded by the castle of Trausnitz, built by the ancient dukes of Bavaria, and now changed into an observatory to which a botanical garden has been attached. The finest buildings in Landshut, are the university attended by six or seven hundred students, the chancery, the townhouse and St. Martin's church, of which the steeple rises about four hundred and twenty feet above the ground. The places of charity are two hospitals and two poor houses. The public library consists of a hundred thousand volumes. A collection of coins and medals, another of mathematical and philosophical instruments, and a museum of mineralogy belong to the university. A theatre of anatomy, as well as a school of medicine and surgery, are open to those who study the medical profession. The town possesses little or no trade; there are not more than five manufactories, and none of them are of any consequence. It was probably on that account that government determined to transfer the university from Ingolstadt to Landshut. The population does not exceed eight thousand five hundred inhabitants.

Freysingen, situated on the Isar, at an equal distance from Munich and Landshut, contains a castle, a fine cathedral, a normal school, and an institution for the deaf and dumb; it is peopled by three thousand six hundred individuals.

It is only necessary to mention those towns which are worthy of notice from their importance, the recollections connected with them, or the monuments they contain. It ought to be remarked that Bavaria differs from the petty principalities that have been described, inasmuch as it contains several large and flourishing cities; as to the towns of two or three thousand inhabitants, we have not thought it necessary to enter into a description of them, and have preferred adding a list of them with their population to the statistical tables at the end of the chapter.

The principal places in the circle of the Isar have been already mentioned; some account shall now be given of the other departments. Passau, the chief town in the circle of the Lower Danube, is situated in a very romantic country at the confluence of the Ilz, the Inn and the Danube. It is in all probability the most ancient city in Bavaria; it consists of four quarters, Passau or the town properly so called, Innstadt on the right bank of the Inn, Ilzstadt on the right bank of the Ilz, and the suburb of Anger, defended by the castles of Oberhaus and Unterhaus, and also by eight forts, formerly known by the names of eight French generals. The suburbs of Innstadt and Ilzstadt communicate with the town by bridges. The principal buildings in Passau are an episcopal palace, a large cathedral and three parish churches, one of which, St. Mary of the Capuchins, was famous for its miracles. It has besides two public schools, a gymnasium, an infirmary, an orphan hospital and five others.^a Although advantageously situated for commerce, it possesses an inconsiderable trade, which consists in silk, wine and grain. The town is on the whole well built, and the population, including that in the different suburbs, amounts to ten thousand five hundred inhabitants. Passau was the place where Charles the Fifth and Maurice of Saxony concluded a treaty, by which the Reformation was confirmed in Germany.^b The rural palaces of Freudenheim, Löwenhof and Rabengut are situated in the neighbourhood.

Of the many pearl fisheries on the Ilz, some are not far from Passau; these pearls are produced by a fresh water

muscle, the *Mya margaritifera* of Linnæus. The animal having no other means of resistance, says the Swedish naturalist, forms the pearls to defend itself against the attacks of a formidable enemy; an aquatic worm perforates its shell and feeds on it; the only way by which it can escape, after an opening has been made, is by filling it by a calcareous secretion from its body. If the secretion be too great, it forms a tubercle that may be easily detached from the shell. The finest pearls are round and of a white colour.

Straubing, a town of eight thousand inhabitants, is advantageously situated on a height near the banks of the Danube. It was the *Castra Augusta* of the Romans; it carries on at present a considerable trade in earthen ware; its crucibles are exported into different countries. The principal edifices are a castle, seven churches, one of them with a steeple two hundred and forty feet in height, four hospitals and a townhouse. The places of education are a gymnasium and several schools. The fine abbey of Ober-Altaich, famous for its valuable library, is situated in the vicinity.

The burgh of Bodenmais is known to mineralogists from the minerals collected in the neighbourhood, and to landscape painters from the cataracts on the Riss and the Mosbach. The importance of the place depends on its mines and vitriol works; the latter furnish every year a supply of nearly two thousand quintals.

Ratisbon, the chief town in the circle of the Regen, was formerly the capital of Bavaria, and the residence of the ancient German kings of the Carolingian race. Having been erected into a free and imperial city by the emperor Frederick the First, it was afterwards restored to Bavaria in the year 1486. It became a second time independent in 1502, and continued so until the year 1803, when it was granted to the Prince Primate. Lastly, when the grand duchy of Frankfort was founded, it and its territory were included in the dominions of Bavaria. The town had been the seat of the imperial diets from the year 1662 to that period. Many of the houses were formerly built with wood, and it was seven times almost reduced to ashes between the years 891 and 1642. Two ecclesiastics were burnt at Ratisbon in 1418, because they maintained that John Huss had been unjustly condemned to death by the council of Constance; but justice was done to the memory of these two victims of intolerance and fanaticism, when the greater part of the population embraced the Augsburg confession in 1542. A famous battle between the French and the Austrians, which lasted five days, and in which Napoleon received a slight wound in the heel, was fought under its walls in 1809. The town suffered much on that occasion; a hundred and thirty-four houses were consumed, and the loss sustained is said to have amounted to one million five hundred thousand florins.

The town is called Regensburg by the Germans; it contains 26,000 inhabitants, and is encompassed with walls, but not defended with fortifications. There are not fewer than twenty-eight churches; the cathedral, which is the finest, was built in 1400. It is unnecessary to mention the hospitals and different seminaries for the education of youth. The museums and scientific collections are worthy of its importance; it possesses a valuable gallery of paintings, and not less valuable libraries. The principal buildings are the palace of the prince of Tour and Taxis, and the townhouse where the Germanic diets assembled; there is a bridge of fifteen arches across the Danube, a thousand and ninety-

^a "It possesses a seminary, a gymnasium, an infirmary, an orphan asylum and five hospitals."

^b See Sleidan's History of the Reformation.
^c "270 feet."

one foot in length. A monument has been erected in honour of Kepler who died in the town. It seems as if the contending armies had spared this tribute to the memory of the man who determined the revolutions and orbits of the heavenly bodies; it was finished in 1808, and received no injury in the following year, during the engagement by which Ratisbon so severely suffered. The streets are narrow and crooked, but clean and well paved. The houses are very high, and built in the German style. The manufactures are neither numerous nor important; vessels are built for the navigation of the river, and the principal trade consists in the transportation of goods.

Ratisbon was the birth place of Don John of Austria, the natural son of Charles the Fifth, and one of the greatest generals that flourished in the sixteenth century; he gained the battle of Lepanto, kept the Netherlands under the dominion of Spain, and was at last poisoned by his brother, that suspicious tyrant Philip the Second, who feared that he might become sovereign of Flanders.

Stadt am Hof, or the town of the court, may be considered a suburb of Ratisbon, as it is only separated from it by a bridge. It was reduced to ashes in 1809, but it has since been rebuilt and improved; the population amounts to fifteen hundred inhabitants.

Amberg is situated about twelve leagues to the north of Ratisbon, and is watered by the Vils, a river that throws itself into the Nab. It is surrounded with walls, which are flanked by seventy turrets; the streets are straight, broad and well built. The public buildings are the royal castle, the college, the arsenal and the town house, the last a Gothic edifice. It contains ten churches, six hospitals, an infirmary, several seminaries, a normal school, a library, and eight thousand inhabitants. Sixty workmen are employed in making arms, and five thousand four hundred quintals of iron are obtained every year from the mines in the vicinity. The Vils is navigable for the small vessels that descend towards the Danube. Thus, the facility of communication with Ratisbon and other towns, and its manufactures of cotton stuffs, tobacco, earthen ware and playing cards, render Amberg a place of considerable trade. It was on the plains which surround the town, that the archduke Charles compelled the French army under General Jourdan to retreat to the Rhine in 1796.

Ingolstadt on the right bank of the Danube, was formerly one of the most important towns in Bavaria, but its population at present is not, according to Hassel, greater than that of Amberg;^a its fortifications were destroyed in 1800. A Latin school has been opened since the university was transferred to Landshut.

Abensberg on the right bank of the same river, was the ancient *Abusina*, a city of the *Vindelici*; several Roman antiquities are still found near its walls. Although a small place of twelve hundred inhabitants, it is encompassed with walls, which are flanked with thirty-two round and eight square turrets. It was formerly the residence of the counts of Abensberg, and a castle that belonged to them, may still be seen in the town.

Eichstedt, a walled town on the banks of the Altmühl, is situated in a narrow but agreeable valley. There are four suburbs, three public squares and as many large streets; it was the chief town in the principality, that was ceded under the sovereignty of Bavaria to Eugene Beauharnois. The

castle may be considered the finest edifice; next to it are the cathedral, which contains the tomb of the martyr Wilibald, and the church of Walpurg; these two churches and four others of less importance belong exclusively to the catholics. The town possesses a gymnasium, different schools, a public library and several collections; it is peopled by more than eight thousand inhabitants. The land in the neighbourhood of Eichstedt is fruitful, and produces corn, hops, flax and fruits; few cattle are reared, but the country abounds with game, and the rivers are well stocked with fish. Iron mines, marble, and other quarries, are worked in the mountains.

Bayreuth, the metropolis of the circle of the Upper Maine, is built on the banks of that river, in a pleasant valley, formed by branches of the Fichtel-Gebirge. The elevation of the town may be about six hundred and forty feet^b above the level of the sea. The streets are broad, regular and well built; it is surrounded with old walls and three suburbs, one of which is the small town of St. George. The finest buildings are the old castle of Soplhenburg, and the new palace. Although the population consists of fourteen thousand inhabitants, there are not more than a thousand catholics; the latter have their church, and the Jews their synagogue. Bayreuth contains several hospitals, a gymnasium, a theatre and different manufactories.

Bamberg, a town watered by the Regnitz, has been incorrectly considered the ancient *Bergium*, a place mentioned by Ptolemy; it is certain that Bamberg was not built long before the tenth century;^c it was the residence of the counts of the same name. The population amounts to nearly thirty thousand souls; in point of situation and architectural beauty, it may vie with any other town in Bavaria. The houses are built of free stone; it is divided into three parts by two fine bridges; and the highest quarter rises majestically in the form of an amphitheatre crowned by several hills. The castle of Petersberg has been much admired; among the other buildings, may be mentioned a fine church, that contains the tombs of the emperor Henry the Second and Cunigunda his wife, twenty-three other churches, fifteen chapels, three hospitals, an infirmary and a house of correction—a very large edifice. A public library, a collection of natural history, and the archives of the country are deposited in the castle of Petersberg. Bamberg offers a singular contrast with Bayreuth, in as much as it does not contain a thousand protestants. The places of education are numerous; the lyceum is attended by fifty pupils; the gymnasium by two hundred and fourteen, while the number of masters is not less than six. There are besides an ecclesiastical seminary, a normal school for thirty or forty pupils, a school of medicine and surgery, and another of midwifery. Bamberg was the birth place of Camerarius the philologist. Although it possesses no great commerce, there are about fourteen hundred master workmen of different kinds, eleven hundred journeymen and three hundred apprentices, besides five booksellers, four apothecaries, and fifty-six breweries.^d

Hoff,^e at a short distance from the eastern frontier of the kingdom, is watered by the Saale; it contains several schools, a rich hospital, a library and eight thousand inhabitants. Kulmbach,^f a pleasant town in the same department, is surrounded with walls, and situated on the banks of the White Maine. The streets are irregular but well paved,

^a "Its population, according to Hassel, is equal to that of Amberg."

^b "Elevation 608 feet."

^e Hof, Stadt zum Hof.

^f Culmbach.

and the market place is remarkable for its size. Like every other town of any consequence in the circle, it contains a sufficient number of hospitals and charitable institutions. The population amounts to little more than four thousand five hundred inhabitants. Plassenburg at no great distance from the last town, stands between two lofty mountains; it may be mentioned on account of its fortress, now a state prison, and the station of a considerable garrison.

Some account may be given of Gailenreuth, a village in the same circle, situated on the west bank of the Weissent, in the basin of the Regnitz, and famous for its natural caverns, filled with fossil bones, which have recently excited the attention of naturalists. The largest of these caverns lies in a vertical rock, and bears the same name as the village; the entrance is about seven feet in height, and opens into a grotto nearly eighty feet in length, which communicates by an aperture not more than two feet high, with a second cavity nearly a hundred and thirty feet long, and forty broad. The height of the second cavity near the aperture is about eighteen feet, but it descends gradually until it becomes so low as five. A narrow passage at the farther extremity communicates with several others which lead to a third grotto about thirty feet in diameter, and five or six in height; the earth on the floor of this grotto is filled with the teeth and jaw bones of different animals. There is a cavity at its entrance, into which one can descend by a ladder, and pass from it to a vault fifteen feet in diameter, and thirty in height, that communicates with a chamber covered with bones. A natural arcade below it leads to another cavern more than forty feet from the ground to the roof.^a This chamber terminates in a cavity or pit about eighteen or twenty feet in depth, and a passage from it communicates with a cave about forty feet in height, and almost filled with bones. Passages lead from the last cave to one about twenty-five feet long and twelve broad, to another twenty feet high, and lastly to a third eighty feet in breadth and twenty-four in height, which contains more bones than any of the preceding. But this is not the end of the labyrinth; the stranger has to advance to the sixth and last cavern. All these subterranean chambers form a figure not unlike a semicircle. The fissures that are perceived in the calcareous rock, may perhaps be passages to other caverns; thus, it was found in 1784, that one of these fissures communicated with a chamber, filled with the bones of hyenas and lions. It has been remarked that the cleft was much too narrow for the entrance of these animals. The chamber terminates in a sort of arcade, and I observed in it, says M. Cuvier, an incredible number of bones and skulls.^b It has been ascertained that the animals of which these are the remains, were bears, hyenas, tigers, wolves, foxes, gluttons, polecats, and some herbivorous animals, such as different kinds of deer. But the carnivorous animals are in so great a proportion, that out of a hundred bones, three in general will belong to hyenas, five to wolves or foxes, two to tigers, three to gluttons and eighty-seven to bears. All these animals, different in their figure and dimensions from those of the present day, attest the past existence of a former world. If it be wished to determine why the bones of so many animals are collected in these places, it may be supposed either that they were the dens of wild animals that brought their prey into them, or rather that an enormous number of ear-

nivorous animals, with others of a different class, were accumulated in the cavities by an irruption of the waters.

More manufacturing and trading towns are situated in the circle of the Rezat than in any other in Bavaria. Ansbach, the metropolis, which was formerly called Onolzbach, is now more generally known by the name of Anspach. The town is surrounded with walls, and watered by the Rezat. There are eighteen public buildings, of which the principal are the castle and chancery. The population amounts to seventeen thousand inhabitants, and the number of catholics does not exceed three hundred. The places of instruction are a gymnasium and several elementary schools. Anspach is not a town of much trade; the manufactures are leather, linen and woollen stuffs.

Erlangen or *Christian Erlangen*^c on the Regnitz, is enclosed by walls, and divided into the old and new town; the streets are broad and regular. It possesses, besides the only protestant university in the kingdom, many seminaries in which different branches of education are taught. The imperial academy of natural history was founded in the year 1666; the other institutions of the same sort are a physical society, another of medicine,^d and a third of agriculture and rural economy. It has excited surprise that so many useful institutions are contained in a town of twelve thousand inhabitants.

The trade and manufactures of Erlangen are of considerable importance, but in that respect it is inferior to Fürth, a well built town on the same river. The Jews form about the fourth part of the population, which is equal to sixteen thousand eight hundred individuals. They maintain at their own expense a separate tribunal, an university, two printing offices, three schools, an hospital and four synagogues; such facts form the best answers that can be made to those who maintain that the Jews can never become good or useful citizens; indeed, in many places where the Jews participate in the rights of citizens, they may bear a comparison with the Christians who despise them. Fürth is one of the most industrious towns in Bavaria; it carries on a great trade in mirrors.

Nuremberg or Nurnberg stands in the middle of a fruitful though sandy plain, and is divided into two parts by the Pegnitz. It is surrounded with an outer and an inner wall, both of them flanked with towers, which renders it not unlike two towns. The streets are irregular, but broad and well paved; although the old castle cannot at present be called a fortress, still it and almost all the other buildings in Nuremberg, call to mind those ancient towns which served as a residence to the princes or barons who flourished in feudal times, and whose power depended on the weakness of their neighbours. The paintings that cover the outer walls of many houses in Nuremberg give it a singular aspect. The townhouse is remarkable for the pictures and curiosities it contains; among other articles, one may observe the glass out of which Luther used to drink. Some of its eight churches are adorned with fine paintings; the painted windows in the cathedral are admired, and those in the church of St. Clara are remarkable for their antiquity, dating back to the year 1278. A well five hundred and thirty-six feet in depth is situated in one of the courts belonging to the castle, an old building in which may be seen a valuable collection of paintings. The town is adorned

^a "40 feet in length."

^b Recherches sur les ossements fossiles, tome IV. p. 295.

^c Erlangen is divided into the old and new towns; the latter was

founded in 1686 by Christian Ernest, Margrave of Bayreuth, and is from that circumstance called *Christian Erlangen*.—P.

^d "A physical and medical society."

with several fountains; it possesses a great many schools, a gymnasium, different literary and scientific societies and seven public libraries. The commerce of Nuremberg must be considerable, since by means of it three hundred and fifty mercantile houses are supported; not fewer than four hundred and eighty-seven different articles are made or manufactured within its walls.^a It has been supposed that it carries on a greater trade in cutlery than any other town in Germany; it contains two exchanges, a bank and a mount of piety. The catholics make up a twentieth part of the population; the total number of inhabitants has been estimated by Hassel at thirty-one thousand six hundred and sixty-five. Nuremberg was the birth place of Albert Durer, the celebrated painter, and of other distinguished men; indeed if the inventions to which it has given origin be considered, it is entitled to the gratitude of the human race. Peter Hele invented watches there; Rudolph, the drawing plates for iron wire; John Lobsinger, air guns; Christopher Denner, the clarinet; Erasmus Ebener, the alloy known by the name of brass; Martin Behaim, the terrestrial sphere, which without doubt contributed to the discovery of America; lastly, John Muschel improved different musical instruments.

The other towns in the same circle might be considered insignificant after Nuremberg. Schwabach on the river of the same name, is noted for its needles and cotton cloths; it contains nine thousand five hundred inhabitants. The small town of Bayersdorf on the Regnitz, carries on a trade in cutlery and hardware goods. Rothenburg is built in the Gothic style; it contains a fine townhouse, a library, valuable from its rare manuscripts, and a population of eight thousand persons. Dinkelsbühl, encompassed with high walls, flanked with towers, is built like the last town, and peopled by seven thousand inhabitants.

Nördlingen is well known in Germany for its bacon and geese; more than thirty thousand of the latter are annually exported. It is built on the Egger, and surrounded with ditches, ramparts and towers. St. Magdalen is the largest church in the town, and its steeple reaches to the height of three hundred and forty-three feet. The number of inhabitants amount to seven thousand six hundred, and their trade consists in the produce of their manufactures, such as linen, worsted stockings, fustians and horse covers.

The circle of the Lower Maine is formed by the former grand dutchy of Wurtzburg, the province of Aschaffenburg, different parts of the territory of Fulda, and several districts ceded by Hesse.

Wurtzburg,^b the capital, contains about twenty thousand inhabitants; once an imperial town, it was afterwards subject to a bishop, one of whose prerogatives was to have a naked sword carried before him. The fortifications have fallen into decay, but the town is still defended by a high wall and a deep ditch. The Maine divides it into two parts; that on the right bank of the river is the old town of Wurtzburg; the other on the left bank is called the quarter of the Maine. A fine bridge of eight arches, and five hundred and forty feet in length, forms a communication between the old and new towns. The fortress of Marienberg in the

quarter of the Maine, rises on a rock about four hundred feet in height, and on the same hill are the ruins of an ancient building, which is supposed to have been a temple consecrated to *Freya*, the Venus of the Scandinavians. The old town, though irregularly built, is adorned by several fine buildings; such are the royal castle and the cathedral, the largest of its thirty-three churches, which is remarkable for many curious monuments, and also for a pulpit of the most finished workmanship. The great hospital of Julius, twelve other hospitals and several charitable institutions, different libraries and scientific collections, numerous schools, an university, which was founded more than four hundred years ago,^c and considerable trade, particularly in wine, render the town one of the most valuable acquisitions which Bavaria has lately obtained.

The vineyards in the neighbourhood of Wurtzburg have been celebrated since the thirteenth century. The Leiste is the most esteemed among the wines of Franconia; the Stein wine is produced on an estate that belongs to the hospital of Julius; it is sold in the country for four shillings the bottle.^d Another sort not less prized is known by the name of the Holy Spirit; it is produced in the vineyards of Harpe, which belong mostly to the chapter of Hauch. The wines of Schalksberg and Cahnus are little inferior to any that have been mentioned.

Karlstadt^e on the Maine, carries on a considerable trade in wines. Schweinfurt on the same river, a town of seven thousand inhabitants, possesses an arsenal, a gymnasium, and several elementary schools. It is abundantly supplied with water from thirty-seven public fountains. The excellent wine of Saleck constitutes the trade of Hammelburg, a small town on the Saale. The five thousand inhabitants of Kitzingen are mostly engaged in conveying goods to the south of Germany. The town is remarkable for a bridge across the Maine, which leads to the suburb of Etwashausen. The number of arches amounts to fifteen, and it is not less than a thousand feet in length. As it does not exceed sixteen feet in breadth, its length appears so much the more considerable.

Aschaffenburg is situated on the banks of the Maine, at the foot of the western declivity of the Spessart. Its importance depends on its schools and scientific collections, not on the number of its inhabitants, which does not exceed six thousand. A large castle in the middle of a park is its finest edifice. It was a place of residence during the summer for the electors of Mayence. It possesses at present a trade in leather and beet sugar; it is besides the depot of the merchandise that descends the Maine, and of the timber obtained from the forests on the Spessart.

The circle of the Upper Danube derives its importance from the number of its towns, and the different branches of industry in which their inhabitants are engaged. More paper-mills are contained in it than in any other department in Bavaria.

Augsburg, the capital, although inferior to Munich, is the second town in the kingdom. Having already made some mention of its antiquity, it may now be more minutely described. It stands on a large and fertile plain between the

^a "487 manufactures de differens products."

^b Würzburg, (Germ.)

^c Instruction is there committed to thirty-one professors and four teachers. The number of students in the winter session of 1825 and 1826, amounted to six hundred and seventy-six, viz. four hundred and ninety-seven Bavarians and a hundred and seventy-nine foreigners, distributed among the different faculties, as follows:

Theology	-	-	-	-	-	-	-	-	-	144
Law	-	-	-	-	-	-	-	-	-	213
Medicine	-	-	-	-	-	-	-	-	-	158
Philosophy	-	-	-	-	-	-	-	-	-	161

^d "When old, it is sold for more than five francs the bottle."

^e Carlstadt.

Lech and the Wertach, which join each other below its ramparts, and carry their united streams to the Danube. The number of inhabitants is estimated at thirty-three thousand; as in other ancient towns, the streets are narrow and irregular; a few only are straight, and among these that of the *May* is the finest in Augsburg. The fountains which embellish it contribute to render it more salubrious. The principal squares are those of the May, Caroline and the new market place. The townhouse is admitted to be the largest and most regularly built of any in Germany; the golden hall, a chamber in the same building, is a hundred feet in length, and nearly fifty in breadth.^a It was in the ancient episcopal palace, now changed into government offices, that the confession of Augsburg was read before Charles V. in 1530. The cathedral is considered a finer building than any of the other twelve churches,^b six of which belong to the Catholics and six to the Lutherans. One church, however, that of St. Ulric, cannot be too highly commended for its bold and lofty arches; the Lutherans and Catholics perform their rites in it alternately. The church of the Franciscans is remarkable for the size of its organ; the other public buildings are the arsenal, the market and the theatre. Augsburg is still the residence of a bishop, but he does not enjoy the same power as formerly; the diocese was once richer than any other in Christendom, and the bishops of Augsburg were entitled princes of the empire. Hartmann^c bequeathed to the bishops, in the thirteenth century, his riches and the county of Wittlingen.^d It became afterwards more important, but was reduced at last like almost all the other chapters in Germany. Augsburg has its gymnasium, different seminaries, a polytechnic school, a public library and a fine collection of paintings, most of them by German masters. The capital belonging to hospitals and charitable institutions, was equal in 1807 to 6,600,000 florins. Although the manufactures of Augsburg were formerly in a more flourishing condition than at present, its trade is still very considerable; indeed its manufactories of every sort, and its many mercantile houses, render it a central point in commercial Europe.

Neuburg on the Danube, is peopled by seven thousand inhabitants; it is encompassed by walls, and commanded by a castle, built on an eminence. The barracks, three churches, a lyceum and several hospitals are the principal public buildings, but the most interesting monument is the tomb of La Tour d'Auvergne, who was killed in the year 1809, on the road between Neuburg and Donauwörth, a small town of two thousand five hundred inhabitants, where Lewis the Severe ordered his wife Mary of Brabant to be beheaded, and which is famous for the victory gained over the French and Bavarians in 1704 by the English and Austrians, under the command of Marlborough. That bloody engagement took place near the village of Blenheim, and about eighty years afterwards^e an immense quantity of bones were dug up by labourers, while they

^a "92 feet long, 48 broad."

^b "The cathedral is the finest of its twelve churches."

^c Hartmann, Count of Dillingen.

^d The town of Dillingen, the county of Wittlingen, and other possessions. (Busching.)—P.

^e "A. D. 1780."

^f Kempten, under the empire, consisted of two contiguous towns, viz. the free imperial town of Kempten (*Reichs-Stadt*), and the abbey town (*Stifts-Stadt*), immediately dependent on the sovereign abbey of Kempten.—P.

^g Lindau stands on an island in the lake, and from that circumstance has been called Swabian Venice. (Busching.)—P.

^h The sovereign abbey of Lindau, consisting of an abess and twelve nuns, all of noble family.—P.

were employed in making a road. Tallard had obtained the command of the French army by intrigue, while Villars might have led it to victory; at all events, its fate was avenged by the French both in 1796 and in 1800.

Memmingen, formerly an imperial town, is watered by the Ach; it contains eight thousand inhabitants. The townhouse, the arsenal and the chancery are the most remarkable buildings. It possesses a lyceum, a public library, a musical school and different seminaries. Heiss, Sichelbein and other artists were born in the town; its trade, which is at present considerable, consists in hops, linen, serge and different kinds of cloth.

Kempten rivals the last town in industry and commerce. It is situated on the banks of the Iller, and surrounded with hills. It was founded before the eighth century. Hildegard, the wife of Charlemagne, gave to the chapter of the town all the wealth which was left her by her mother. A part of the town is dependent on the convent, which still bears the name of the empress,^f and in that quarter many hospitals, charity-schools and other benevolent institutions are situated.

Lindau, formerly a free and imperial town, is situated on the lake of Constance. Its population amounted at one time to six thousand inhabitants; it does not exceed at present three thousand five hundred. The harbour, or rather the Maximilian basin, may contain three hundred vessels. Because many of the houses are built on piles, the town has been called Little Venice.^g The castle, which commands it, was for a long time inhabited by nuns.^h

The different circles that have been described are governed by commissioners, and the police is subject to the authority of other commissioners.ⁱ Each circle is also subdivided into different courts or justices, as they are called in the country, and all of them have their chief towns. As several of these courts are more or less dependent on privileged nobles, they are therefore styled mediate or seigniorial courts,^k their decisions may be revoked by the supreme tribunal at Munich.

The Rhenish possessions of Bavaria constitute the circle of the Rhine; it is mostly formed by the former French department of Mont-Tonnerre, and by some districts in the departments of the Sarre and the Lower Rhine. It is equal in superficial extent to a hundred and forty German, or to nearly one thousand six hundred and eighty English square miles.^l The country is bounded on the north and west by the Prussian province of the Lower Rhine, and by some districts belonging to the duchy of Saxe-Coburg-Gotha and the landgraviate of Hesse Homburg, on the south by France, and on the east by the grand duchies of Baden and Hesse Darmstadt.

The northern extremity of the Vosges occupies a great part of the surface. According to Hassel, the summit of Wandelstein is 2000 feet above the level of the sea, but it is much lower than the Donnersberg or Mont-Tonnerre.^m

ⁱ Each circle is governed by a Commissary-general (*Generalkommissär*), assisted by a council; the commissioners of police are subject to him. (Hassel.)—P.

^k The circles are divided into *Landgerichte* and *Mediatgerichte* or jurisdictions either independent of or dependent on privileged nobles, and these are subdivided into communes or districts (*gemeinden*) both in towns and in the country (*stadt* and *rural-gemeinden*).—(Hassel.)—P.

^l "389 sq. leagues." The English square miles are obtained by multiplying the German square miles by 12, which is much too small for the German geographical square mile.—P.

^m Thunder Mountain. Height 2400 Fr. feet. (Table of European Altitudes.)

The mountainous districts are composed of red sandstone and other rocks of secondary formation ; but between them and the Rhine, which forms the natural boundary of the country, a long belt of limestone^a extends from north to south, on which rest deposits of tertiary formation through which the river flows. Almost all the mountains in the circle are well wooded, but the southern declivities of the branches which project from the principal chain, are covered with vineyards. The largest forests are that of Bien which is about fifteen miles in length, and nearly two in breadth,^b and that of the Harth, which contains more than thirty thousand acres (*arpens.*) The rivers that water the country, flow either towards the north and the east, and enter the Rhine, or towards the south, and unite with the Sarre. The climate is wholesome, but colder on the mountains and western declivities, than on the eastern declivities or in the plains that extend along the Rhine.

The country abounds in clay, well adapted for bricks and coarse earthen ware, in marble, coal, rock salt and different metals ; it yields annually thirty-three thousand quintals of iron, eighty-five thousand of coal, and six hundred and seventy-two of mercury.

The eastern declivity of the mountains was inhabited during the time of Cæsar by the *Nemetes*, and their lands extended to the Rhine. The *Mediomatrici*, occupied the western declivities ; but as they possessed besides, nearly all the territory which now forms the department of the Moselle, they shall be mentioned more fully in the account of France. Little is known concerning the *Nemetes* ; it is certain, however, that a little before the war carried on by the Romans against Ariovistus, they settled on the left bank of the Rhine, which they had compelled the *Mediomatrici* to abandon ; they inhabited before that period the right bank of the same river. Tacitus does not consider them as Gauls ; without doubt, says the historian, the *Vangiones*, the *Triboci* and the *Nemetes* are of German origin.^c It appears from the same author, that they served as auxiliaries in the Roman armies.^d

The circle of the Rhine is not governed in the same manner as the other Bavarian provinces ; with the exception of some modifications that have been made in it, the system, which was established by France under the imperial government, has been retained. It is divided into four departments, which are subdivided into thirty-two districts.^e Speyer or Spire, the capital, is watered by a small river of the same name, at a short distance from the Rhine. It is surrounded with walls, and five gates form the entrances to the town. The principal edifices are the townhouse and the cathedral, the last of which contains the ashes of eight emperors and as many empresses ; the monuments erected to their memory, are now in ruins. It possesses fifteen catholic and two protestant churches ; yet out of its six thousand four hundred inhabitants, there are not more than sixteen hundred catholics. Some authors believe it to have been founded before the Christian era.^f The same writers pretend that *Spira* and *Nimioda* were its ancient names, and

that it was the chief city of the *Nemetes* (*civitas Nemetum.*)^g It cannot be denied that it was one of the cities of the empire at the commencement of the middle ages, and there is reason to believe that it was the metropolis of a bishopric in the year 348. But this bishopric had been suppressed before the reign of Dagobert the First, since that prince restored it and conferred it on his chaplain Athanasius. If the streets and buildings do not appear to be so ancient, it must be recollected that it was destroyed by the French during the war in the Palatinate.

The other towns in the circle are not very important. Frankenthal, the name of which serves to recal the ancient kingdom of Franconia, contains only four thousand inhabitants, but it possesses a greater trade than any other town in the province. Grunstadt, situated in a fruitful district, watered by the Liss, was the birth place of Olbein, the celebrated painter.^h Kaiserslautern, which contains a gymnasium, a normal school, and four thousand six hundred inhabitants, is more memorable from the battles fought by the French and Prussians in the year 1793 and 1794. Pirmassenz, the scene of a destructive combat at the same period, is well built ; it possesses a fine castle, and its population amounts to five thousand individuals. Deux-Ponts or Zwey-Brücken, which contains six thousand inhabitants, is agreeably situated on the Erlbach ; the streets are clean, straight and well paved. It is adorned by a fine castle, but the one that belonged to the ancient dukes of Deux-Ponts, is wholly destroyed. Landau on the Queich, a town fortified by Vauban, although reserved for the confederation, is at present the station of a Bavarian garrison. The fortifications form a regular octagon ; two gates only lead to the town, and the population is the same as that of Deux-Ponts. The streets are regular ; the barracks, powder magazines and storehouses are bomb proof. Germersheim, situated also on the Queich, and not far from the Rhine, may be mentioned on account of its old fortress, where the emperor Rudolph of Hapsburg died, and also on account of a gold washing which has been established in the neighbourhood, on the banks of the river. Several burghs and villages of some importance from their population, shall be enumerated in the tables at the end of the book. The trade of the circle is not without activity, but it might be much improved if the canals of Frankenthal and Deux-Ponts, which have been neglected by government, were finished and kept in good repair.

It was thought unnecessary to enter into minute details concerning the places of education and the scientific institutions in the different towns in the circle ; it may be remarked, however, that the diffusion of knowledge has been more promoted by the Bavarian than by the former French government. The population of all the towns in the circle, and in the other Bavarian provinces, has not been stated, but the reader may be referred to the following tables, in which will be found the most important facts relative to the statistics of the kingdom.

STATISTICAL TABLES

OF THE

Kingdom of Bavaria Proper and of the Bavarian possessions on the Rhine, according to the latest authorities.

The Population of Bavaria Proper and the Rhenish province amounted in 1827 to 3,960,000 individuals, or on an average to 2,628 for every German, or 220 for every English square mile.^a

Number of families	875,560
Noble families	1,384
— having seigniorial estates	878
— without landed property	506

	Number of Seigniorial Estates. b	Number of Families for every German Square Mile.
Circle of the Isar	227	377
— the Lower Danube	153	499
— the Regen	179	444
— the Upper Maine	100	566
— the Rezat	64	781
— the Lower Maine	77	622
— the Upper Danube	78	610
— the Rhine	0	809

Division of the Inhabitants according to their Origin.

Germans	3,880,000
Jews	56,500
French	3,500

Division of the Inhabitants according to their Religion.

Catholics	2,710,000
Lutherans	1,100,000
Reformed or Calvinists	78,000
Mennonites and other Dissenters	1,000
Jews	56,000

Distribution of the Population.

Inhabitants in the towns of the first and second class	563,000
— in the small towns and in the country	3,377,000

Towns, &c. according to Hassel.

Number of towns	229
— burghs	399
— parochial villages	2,920
— small villages and hamlets	28,449
— taxed houses, about	652,000 ^c

Mortality in different parts of the Kingdom.

At Nuremberg	1 in 40
At Augsburg	1 in 35
In the Circle of the Isar	1 in 29
In the Circle of the Upper Maine	1 in 38

Mean Number of Capital Punishments.

The proportion in all the Bavarian possessions, is as one to twenty thousand individuals.

^a Reckoning the German square mile at only 12 English. "950 per sq. league" Fr. The population per Eng. sq. mile should be 125 nearly.—P.

^b By a comparison of the number of seigniorial estates with the number of families in the different circles, it will be perceived that in those circles where the number of such estates is the greatest, the population is least considerable, unless, indeed, the natural effect of such estates be counterbalanced by particular circumstances, as in the Circle of the Isar, the only exception to the rule. The relative population in the Circle of the Rhine is greater than in any other, and in that circle there are no privileged proprietors.

Occupations of the Jews.

Out of 10,663 Jewish families, those engaged in commerce amount to	10,242
In different trades	169
In agriculture	252

Number of Towns, &c. according to the Surface.

Number of towns in every 6½ German square miles	1

BUDGET

OF THE KINGDOM OF BAVARIA IN 1825, ACCORDING TO THE ACCOUNTS PRESENTED TO THE CHAMBERS.

Revenue.	
Direct taxes	8,900,000 florins.
Indirect taxes	9,100,000
Revenue from the royal fiefs, &c.	5,160,000
Royal duties	3,950,000
Receipts in arrear	1,590,000
Different receipts	2,600,000
	<hr/> 31,300,000

Expenditure.	
Sinking fund	8,354,000 florins.
Charges of the household and the court	2,745,000
chambers	52,600
Administration of the household and foreign affairs	570,000
justice	1,732,000
the interior	1,300,664
finances	1,011,600
Public instruction	735,148
Clergy	1,251,172
Hospitals	118,851
Roads and bridges	1,300,000
Army	7,880,000
	<hr/> 27,051,535
Royal establishments	4,195,936
	<hr/> 31,247,471

National debt.	
In 1820 it amounted to	110,876,084 florins
In 1824 to	110,781,740
Reduction in four years	94,344

In general, to ascertain the population of Bavaria in 1827, it is necessary to add a twelfth to the numbers given by Hassel for 1822, a rule, which may be followed in the detailed account of each circle.

BOOK CXXIV.

EUROPE.

Europe continued.—Germany.—Eighth Section.—Territories and Free Towns of Bremen, Hamburg, Lubeck and Frankfort on the Maine.

AN account shall be given in the present book, of the territories and towns that have continued free, notwithstanding all the changes introduced into the political divisions of Germany, by the ambition of conquerors, and the intrigues of cabinets. Before we cross the mountains, which separate Bavaria from Bohemia, before we describe the provinces of the Austrian empire, it is necessary to examine the remains of that federative power, which possessed for several centuries, so much influence in the affairs of Germany.

Industry and commerce are so favourable to civilization by the wealth they diffuse, and by the spirit of independence they produce, that wherever they exist, wherever they flourish, freedom triumphs sooner or later over every obstacle. In the middle ages, the principal towns in Germany, subject to the empire, were governed by bishops, dukes and counts, who often endeavoured to destroy their independence. Worms and Cologne proved their attachment to the emperor Henry the Fourth, by embracing his cause against the authority of their bishops.^a Their conduct determined the crown to increase the number of freemen by granting to the working classes in those cities, the right, which at the time was considered a privilege, of being exempted from the custom then prevailing, by which the bishops and lords, who possessed the temporal authority, inherited the moveable property of the lower orders, or at least as much of it as they pleased. Other towns obtained successively the same advantages; not long afterwards, they purchased the right of choosing their own magistrates, and also of sending deputies to support their interests in the Germanic diets.^b

These immunities or privileges, which distinguished the imperial towns from the other cities, were at first only conferred on the persons who inhabited within their walls. But the peasants, being naturally anxious for some security against the oppression of their lords, bought the right of settling under the walls, between the ditches and palisades; they were therefore called *pfahlbürger* or burgesses of the palisades, and their houses, crowded round the walls, were in course of time denominated suburbs.^{c,d} The towns extended gradually the limits of their jurisdiction to a considerable distance from their ramparts. As many as settled in their territory, enjoyed the privileges of citizens, under the name of *ausbürger*, or outer burgesses; hence the ori-

gin of free towns, possessing territories equally free, and forming small independent states. So many advantages made the nobles still more jealous of the imperial cities. If it be difficult to obtain freedom, it is still more so to preserve it. Although the towns rivalled each other in commerce and industry, they found it necessary to unite and to form a sort of federative state, that they might be better able to resist the power of the bishops and lords, who denied their rights to be valid, because they had been acquired by purchase. Compelled by the usurpations and oppressive authority of the independent nobles in Germany, more than sixty towns formed a confederation on the Rhine in the year 1255.

The origin of the Hanseatic league, may be attributed to similar causes, although its object was to promote the commerce of some imperial towns. The old German word *hanse*, which signifies an alliance, did not merely indicate the intention of facilitating commercial transactions between the different towns, but of resisting the princes on the coasts of the Baltic, and maintaining a free navigation on that sea. The league dates from the year 1164, and Bremen was the first town that planned and executed the project. The wealth acquired by the alliance was so great, that many trading towns in different countries entered into the league; among the number, might be mentioned Antwerp, Amsterdam and several other ports in Holland, Calais, Rouen, Bordeaux and other towns in France, and lastly, Cadiz, Lisbon, Naples and London. But this gigantic confederation was gradually reduced to a few maritime towns on the Baltic. The Hanseatic union, founded for commercial purposes, became a great naval power; it had its fleets and armies, which were formidable to the kings of Denmark. It blockaded Copenhagen in the fourteenth century, and forced Waldemar the Third to give up the province of Schonen to the confederation. Forty vessels, manned with good seamen and twelve hundred soldiers,^e sailed on an expedition against Eric, king of Denmark, in 1428. The league assisted Brunswick in 1615, at that time invested by its duke, who was compelled to raise the siege.^f The grand master of the Teutonic order, Sweden and Denmark, were at different times, protectors of the league; but it lost at last its energy and its power; the causes, which had led to its formation, ceased gradually to exist; its commerce still remained, but its armies were useless. The number of Hanseatic towns at the commencement of the eighteenth century, was reduced to six, namely, Bremen,

Lubeck, Hamburg, Rostock, Dantzic and Cologne. They retained however only an empty title; they had no alliance to maintain. At present, Bremen, Hamburg and Lubeck are only considered as free towns, possessing separate governments.

As the assemblies of the ancient Hanseatic league were held in Bremen, it ought perhaps on that account to be first described. It is situated on the banks of the Weser and the Wümme, at thirty leagues from the sea. It must have been a place of some importance about the end of the eighth century, when Charlemagne made it the capital of an archiepiscopal see; it contains at present five thousand three hundred and sixty houses, and thirty-eight thousand inhabitants, at least two thirds of whom are Calvinists. The cathedral is reserved for those who adhere to the Augsburg confession, and the Calvinists have four parish churches. The principal seminary is a gymnasium for the children of Lutherans and Calvinists; there are besides other schools, a library and a museum of natural history. The public buildings are, the observatory of Dr. Olbers, who was born in the town, the exchange, the chamber of commerce, and the townhouse, an edifice remarkable not only for its curious architecture, but also for its cellars, in which are contained an immense quantity of the finest Rhenish wines. Bremen is divided into the old and new town; the first is gloomy and ill built; the second, which is situated on the left bank of the Weser, contains some regular streets and modern houses; the old fortifications of the town are now changed into public walks.

The manufactures are linen, camlet, cloth, hats, worsted stockings, tobacco, oil and glass. The art of refining sugar is well understood, and the beer is reckoned to be better than any other in Germany. But the wealth of Bremen depends not so much on its manufactures as on its commerce. The many advantages of its situation render it the mart of all the merchandise that descends the Weser; indeed it was considered, after Hamburg, one of the most important acquisitions, which the French made under the imperial government; it then became the capital of the department of the Mouths of the Weser. It carries on a great trade in the herring, salmon and whale fisheries: eleven of its vessels were sent to the herring fishery in 1817. The linens and cottons prepared in its bleachfields, are purchased in different parts of Germany, to the amount of five millions of rixdollars annually. It gives in exchange for these and other articles, French and Spanish wines, and different kinds of colonial produce. The number of vessels that enter its port every year exceeds a thousand. Banks and maritime insurance offices have been established to facilitate and encourage its commerce; its revenues amount to four hundred thousand florins.

The territory belonging to it contains ten thousand inhabitants, and the extent of surface is little more than fifty English square miles;^a in that small space are situated the burgh of Vegesack, and thirty-five villages or hamlets. The same burgh and Elsfleth in the dutchy of Oldenburg serve as ports for Bremen. But as large vessels cannot even enter these small ports, which are at some leagues from the sea, all the goods are conveyed to the town in boats.

Bremen is governed by a council composed of four mayors, two syndics and twenty-four counsellors, seven-

teen of whom are lawyers, and the remaining seven, merchants. Calvinists only are admitted into the council; indeed the exclusive system has been carried so far, that Lutherans cannot hold civil employments.^b Thus, although the magistrates may be upright men, the laws are oppressive, and many inhabitants are deprived of what may be considered their just rights. The government of the town and territory is vested in the council, and the revenue is committed to its management; it presides over the administration of justice, and whenever matters of importance render it necessary, calls together the leading and influential citizens, who, although they meet at no stated periods, form a sort of legislative assembly.

It may be remarked in proof of the patriotism which prevails in this small republic, that all the citizens capable of bearing arms are divided into different classes. The men from twenty-six to thirty-five years of age form three battalions. The officers of government are only exempted, if their duties are incompatible with the military service. The men from twenty to twenty-five years of age, make up another battalion, the only one which is equipped at the expense of the state. The town has no other troops than this sort of national guard; it is, however, obliged to furnish four hundred and eighty-five men to the Germanic confederation.

Hamburg was considered one of the most commercial towns of Europe, when it was united to the French empire in 1810, and made the capital of the department of the Mouths of the Elbe. It contained at that time a population of a hundred and seven thousand inhabitants. The lands in the neighbourhood, covered with country houses, plantations and cultivated fields, might have been compared to an extensive and magnificent garden, which the course of the Elbe, and many picturesque views, served to embellish. When France had to resist a powerful league in 1813, Hamburg, which owed its wealth and resources to its commerce, was suddenly changed into an imposing fortress. So great was the extent of the military works, that the lofty trees which shaded the public walks, the country houses that proclaimed the wealth of the inhabitants, as well as the humble cottage of the peasant, and the gardens, hedges and inclosures, were all destroyed to a considerable distance from the walls. A considerable part of the suburbs was levelled with the ground, and the losses which the inhabitants then sustained, were estimated, according to a very moderate calculation, at £3,000,000. But the various articles which were not taken into account, the merchandise that was spoiled, the ships that were damaged, the buildings that were destroyed, made the whole equal to at least £4,000,000. The wants of the French army obliged the general who commanded it, to dispose of more than 7,500,000 marcs^c taken from the funds of the Hamburg bank. By a treaty concluded in 1816, the French government agreed to pay Hamburg the sum of £500,000.^d Peace, by affording encouragement to commerce, has restored the city to its ancient prosperity, and now since it has recovered its independence, vessels from every nation may enter its harbour. It did not contain more than sixty thousand inhabitants in 1814; their number at present is at least a hundred and ten thousand. Of these the Catholics amount to two thousand, the Calvinists to four thousand, the Mennonites to five hundred, and the

^d "10,000,000 francs."

Jews to six thousand ; the other inhabitants adhere to the Augsburg confession.

Although the town, in proportion to its size, may be considered one of the most wealthy in Europe, the public buildings are very ordinary ; two, however, are worthy of particular notice, namely, the exchange and the church of St. Michael ; the steeple of the last of which rises four hundred feet above the ground ; but even these edifices are merely remarkable on account of their positions in the neighbourhood of narrow and dirty streets, brick houses, and buildings which recal the period of Charlemagne, who is believed to have been the founder of Hamburg. The only public walk within the town, is formed by a range of trees, planted near a large basin, called the *Binez-Alster*. Dense crowds frequent the public walk in the summer evenings, and the number of vessels that cover the basin, give it the appearance of a floating city. After London and Amsterdam, Hamburg is the most commercial town in Europe ; the inhabitants are affluent ; numerous equipages are seen on its streets ; the utmost activity prevails in the harbour from morning until two o'clock in the afternoon, and at that hour merchants of every description repair to the exchange. The interior of the houses corresponds with the wealth of the inhabitants, which is displayed in the ornaments of dress, and in the luxury and magnificence of the table. In Hamburg little deference is paid to rank or antiquity of family ; a man is estimated by the importance and extent of his mercantile transactions. The spirit of commerce seems to pervade every individual ; in the theatre and in the drawing-room, in balls and every other place of amusement, trade, the course of exchange, and mercantile speculations are the subject of conversation. Thus, there are few cities where the arts are so little cultivated or so little appreciated ; in the account of the most insignificant towns in Germany, mention has been made of scientific collections, museums, and libraries, but if strangers look for similar collections at all worthy of such a place as Hamburg, they will be disappointed. The books in the public library are not valuable or numerous, the museum of natural history belonging to the patriotic society contains nothing in any way remarkable, and it might be difficult to enumerate more than a very few individuals who devote part of their time to literature or science. These remarks, however, are less applicable to the places of education ; the number is perhaps sufficient for the wants, certainly for the tastes and pursuits of the inhabitants. The principal schools are a gymnasium, a commercial seminary, a drawing and naval academy ; in addition to these might be mentioned a pharmaceutical seminary and different gratuitous schools.^a

Although no mendicants are seen in the streets, yet it is said that there are no less than twelve thousand paupers in the town ; so great a number need hardly excite surprise, if it be recollected that even the necessaries of life are much dearer than in other parts of Germany. The expenses of the work-houses and hospitals are defrayed by the town. Asylums have been erected for lunatics, infirmaries for the sick, and establishments for the restoration of suspended animation and for the reception of those who are attacked with contagious fevers. Vaccination has also met with great encouragement. Not only merchandise, houses and

other kinds of property, but lives are insured. The life insurance company had in its coffers some years ago, a reserve of 1,200,000 marcs banco, or £200,000,^b to enable it to pay to the heirs of the insured, the capitals or incomes stipulated in their contracts.

The people in Hamburg are divided into three distinct classes, the *real burgesses*, the *petty burgesses*, and the foreign inhabitants.^c The real burgesses enjoy all the rights of citizens ; they only are eligible to the different offices in the state, and are permitted the free exercise of every sort of industry, and they are even exempt from paying duty on different goods that arrive in Hamburg vessels. The petty burgesses can only exercise certain kinds of industry, and they pay a yearly tax of one *thaler* for the protection which is granted to them. The foreign inhabitants are also liable to an annual contribution, but as soon as they are admitted, they must pay fifty *thalers*, if they engage in commerce, and forty, if they are artisans. Strangers cannot acquire property either within the town or territory of Hamburg, unless it be in the name of a burgess.

The Jews do not enjoy the rights of citizens, but they may possess houses in certain parts of the town. Although the right of citizenship is not hereditary, yet the sons of burgesses are entitled to some privileges, and they do not pay so great a sum as others for their admission. It was not before the year 1814, that the Christians who did not embrace the Augsburg confession, were allowed to become burgesses, or to hold offices in the state ; they are still excluded from the council.

The form of government is, as Stein calls it, *aristo-democratic* ; the sovereignty is vested in the council and in the burgesses ; the former consists of thirty-six members, amongst whom are included three mayors and eleven magistrates.^d The burgesses are represented by deputies, legally elected, and by hereditary burgesses. The last are the most wealthy and influential of the inhabitants.

Although Hamburg is a fortified town, the military establishment is not great ; the contingent to the confederation has been limited to thirteen hundred men,^e and a numerous national guard serves to defend the town and territory. Magistrates, clergymen, schoolmasters, physicians and surgeons are exempt from the military service ; all the other men in Hamburg, from the age of twenty to forty-six, must enter the national guard, except under peculiar circumstances.

The revenues collected in the town and territory, vary from twelve to fifteen millions of florins. Of all the imposts established by the French government, the stamps and excise are only continued ; these indirect contributions, though very moderate, yield on an average a monthly revenue of sixty thousand marcs ; government may thus, without burdening the people, pay the interest of the national debt, which amounted in 1810, to fifty-two millions of marcs.

Many branches of industry are carried on in Hamburg ; there were a few years ago forty sugar refineries, ten cotton printing establishments, which furnished employment to more than fifteen hundred workmen, twenty-five wire mills, many leather and soap works, more than a hundred velvet and silk looms, and several manufactories of gold and silver

lace, as well as of fine and coarse linen. The dried meat, known by the name of Hamburg beef, which forms a great article of exportation, is cured within its walls. More than twenty copper and brass founderies are situated in its territory or in the immediate vicinity. But the produce of its manufacturing industry, however great, becomes insignificant when compared with its foreign commerce.

It possesses more than two hundred ships, which carry its merchandise to the ports of neighbouring nations, and even to Portugal. It often sends considerable fleets to the whale fishery, and the number of vessels that enter or leave its port every year, amounts to more than twelve hundred. It carries on a very great trade in colonial produce; the reader may form some notion of its importance from the documents contained in the tables at the end of this book. It is one of the greatest marts for sugar and coffee of any town in Europe; the inhabitants themselves consume an immense quantity; it has been estimated at no less than 10,000,000 pounds annually, so that the proportion for every individual, amounts to more than ninety pounds.

The town is better fortified on the side of the land than towards the sea. A basin formed by a branch of the Elbe, serves as a place of anchorage for fresh water boats, and a road twenty feet in depth for larger vessels; the goods and merchandise are transported into the different store-houses, along the canals, which traverse the old town. Although a dike has been built along the river, Hamburg has been more than once inundated; in the year 1771, the waters broke through their barrier, and covered a great part of the neighbourhood and almost all the town; in 1790, the waters of the Elbe rose more than twenty feet in the course of a single night.

Hamburg and its territory form a surface of a hundred and two square miles;^a in the territory are situated a small town, two burghs, thirteen villages and fifty hamlets, the population of which is equal to 20,000 souls.

The territory of Lubeck is enclosed in the dutchy of Holstein; it contains two towns, and seventy-nine villages and hamlets. The extent of surface does not exceed ninety square miles,^b and the population amounts to forty-three thousand individuals.

Lubeck, the capital, contains nearly twenty-six thousand inhabitants. It is situated at the confluence of three rivers, the Trave, the Wackenitz and the Steckenitz, which, at the distance of three leagues, throw themselves into a gulf, that bears the name of the town. Few cities are more advantageously situated than Lubeck, for the Baltic trade. Built in the twelfth century by the emperor Conrad the Third,^c or as others affirm, by Godeschalk, king of the Heruli or Obotriti, in the year 1066, it became a century afterwards, the seat of a bishopric, which before that time had been established at Oldenburg. It was several times destroyed by the Danes, and as often rebuilt by its inhabitants. Wearing by the assaults to which it was exposed from its barbarous neighbours, it put itself, at the beginning of the thirteenth century, under the protection of Frederick the Second, who declared it a free and imperial city. It entered at a later period into the number of Hanseatic towns, and maintained for a long time a considerable influence in the affairs of the

league. In 1810, it was united to the French empire, and became the metropolis of a district^d in the department of the Mouths of the Elbe; its privileges as a free town were restored three years afterwards.

The government is vested in a supreme council composed of four mayors^e and sixteen counsellors, who are chosen from the most influential inhabitants. The spirit of independence, the result of commerce, may have prompted the people to embrace the Augsburg confession at the commencement of the reformation; but it is rather commercial rivalry than concern about religion, which has contributed to the persecution of the Jews in Lubeck, and the same intolerance, far from being diminished by the advances made in knowledge, appears to have gained ground in later times. According to a decree of the senate in 1816, all those who professed Judaism, were obliged to quit the town within a very short period; they had the choice of settling in the village of Moising about two leagues distant, or of leaving the territory.

Lubeck is surrounded with ramparts; the streets, though steep, are broad, straight, clean and well built. The edifices most worthy of notice are the cathedral, which contains several articles of antiquity, the church of St. Mary, noted for its curious clock, and the townhouse in which may be seen the celebrated Hanscatic hall, the council room, adorned with fine paintings, and the hall of the treasury; the arsenal and the exchange are nowise remarkable. Many useful institutions have been founded in the town; the most important are several elementary schools, a gymnasium, different boarding schools, two commercial seminaries, a school of surgery, a drawing academy for artisans, and another for the higher classes.^f Establishments have been founded for the suppression of mendicity, and the relief of the indigent; there are besides a house of correction, and an orphan hospital.

The revenues of the state were estimated a few years ago, at nearly a million of florins, and more than half that sum at least, was derived from the town.^g A tax which still subsists, was imposed on every citizen in 1816, to form a fund for the extinction of the public debt. The military force consists of a national guard divided into fifteen companies, and a contingent of six hundred men^h to the Germanic confederation.

The manufactures of Lubeck consist of tobacco, sugar, leather, soap, silk and cotton stuffs, coarse and fine linen, sail cloth, woollens, gold and silver lace, iron and brass wire, and lastly, ship-building. The commerce consists principally in colonial produce, in the exportation of grain, and in the importation of different products from Sweden, Russia, France, Holland, and England.

Large vessels arrive at Travemunde, a small fortified town, situated at the mouth of the Trave in the Baltic Sea. It is chiefly supported by the trade of Lubeck, and many strangers frequent it for sea-bathing. Its lighthouse commands an extensive view, which stretches on one side to a great distance over the sea, and on the other, beyond the territory of Lubeck.

The ancient Hanseatic towns of Bremen, Hamburg and Lubeck, seemed to have acquired the right of resuming

their independence, at the time when the political divisions of Germany were determined by congress. As they had lost their independence merely by being incorporated in the French empire, it was thought equitable by the European diplomatists, that they should be restored to their ancient privileges after the fall of the conqueror. Besides, their situation at the extremity of Germany was likely to remove the fear of other states imitating their example. But Frankfort is different from the rest, and more interesting than any of them, inasmuch as it forms a small republic, almost in the centre of the Germanic confederation. It became independent at a time, too, when rulers sanctioned reluctantly any institutions in which liberty was admitted as a right, and not as a concession, revocable according to circumstances. It is true that Frankfort dates its freedom from as remote a period as the other towns that have been last described, but it had not been considered a conquest by Napoleon, nor had it been united to France; on the contrary, it had continued since 1806, the capital of a grand duchy, governed by the Prince Primate, when it was declared a free town in 1815. It might have become the most valuable possession of one of the states of the confederation, had it not excited the covetousness of the neighbouring principalities, such as Nassau, Hesse Darmstadt and electoral Hesse, in the midst of which its territory is enclosed. It was for these reasons, not from any consideration of equity or justice, that it gained an independence, to which its present commercial importance must be principally ascribed.

The extent of the territory is equal to five German or sixty English square miles;^a it contains, besides the capital, two burghs and five villages. According to the mean term of the different numbers, assigned by German geographers, the population cannot be estimated at less than sixty thousand.^b The town alone contains more than forty-five thousand inhabitants; the Catholics amount to five or six thousand, the Calvinists to two thousand, and the Jews to five thousand; the rest adhere to the Augsburg confession.

Frankfort, notwithstanding its monuments, palaces and many well-built houses, is not considered a fine town. The streets are for the most part gloomy, narrow and crooked. The cathedral, or the church of St. Bartholomew, a curious and ancient edifice, in which several emperors have been crowned, is supposed to have been built by Pepin or perhaps by Lewis the Pious, king of Germany, who died at Frankfort in the year 876. The golden bull of the emperor Charles the Fourth, is preserved in the Roemer or townhouse; it is written on forty-three sheets of old parchment, and was exhibited for a long time among the curiosities of Paris. Among the other buildings are the *Saalhof* or palace of Lewis the Debonnaire, which has been disfigured by modern additions, the palace of the Teutonic order, and the one that belonged to the prince of Tour and Taxis; besides these, may be mentioned the theatre, and the bridge over the Maine, the last of which commands a magnificent view, and is more than four hundred feet in length.

The name of *Frankfurt* or *Frankensfurt*^c appears to strengthen the tradition that the Franks assembled there in the fifth century, and passed from it into Gaul. It bore the title of a city, when Charlemagne enlarged it, after having

defeated the Saxons under its walls. The suburb on the left bank of the Maine, by which it is separated from Frankfort, is still known by the name of *Sachsenhausen*, whence it may be inferred that it was in early times inhabited by that people.

Frankfort distinguished itself by its zeal in the cause of the reformation; such was the violence of the different parties, that religious opinions occasioned insurrections and revolts, until the greater part of the inhabitants had embraced the doctrines of Luther;^d it acted too an important part in the league of Smalcalden.

It is to a more extensive commerce, that the great number of modern buildings must be chiefly attributed, which if they go on increasing in the same proportion, will soon render Frankfort little inferior to the finest towns in Germany. The new quay and the quarter of *Wollgraben* have been much embellished; they are every day becoming larger, and are likely ere long to form the most important part of the town.

Frankfort differs from Hamburg, in as much as many persons among the wealthy classes cultivate the arts and sciences. It would be foreign to our purpose to enumerate the galleries of paintings, and the valuable collections of engravings, antiquities, and objects of natural history, belonging to different individuals, but the public institutions are creditable to the republic. There are three gymnasiums, a school of medicine, two of drawing, one of architecture, one of painting and engraving, a mathematical seminary and several schools of art. The mount of piety was rather a calamity than a benefit to the people; the town has established in its stead, a fund destined for the assistance of petty merchants and artisans in carrying on their commerce and industry. The public library contains more than a hundred thousand volumes, besides several rare books and a parchment bible printed by Faust in the year 1462. A valuable collection of medals is attached to the same library.

According to the constitution of 1816, the sovereignty is vested in all the citizens, who are born in Frankfort or within its territory. The senate cannot confer the rights of citizens on strangers, until they have resided ten years in the town, nor then only on such as possess an independent fortune. The three branches of government are the senate, the legislative body and the deputies elected by the burghesses.^e The legislative body consists of twenty senators, as many members of the permanent deputation, and forty five burghesses, nominated by the citizens. No person can be elected before the age of thirty years, and if any refuse the office of deputy, they may be deprived of their rights and privileges as citizens.

The inhabitants of Frankfort are divided into three great Christian communities, which under the superintendance of the senate, provide separately for the maintenance of their clergy, churches and schools. But it cannot be remarked without exciting surprise, that in the nineteenth century both at Hamburg and at Frankfort, wise and enlightened rulers entertain such prejudices against the Jews, as serve to recal the ignorance and superstition of the middle ages. If it be owing to commercial jealousy that the leading men of Frankfort have refused the Jews all the rights and privileges of citizens, the measure is not less impolitic than unjust. The Jews are the only inhabitants of a separate quarter;

they are permitted to learn and to exercise certain trades ; but the reader may have some difficulty in believing that according to a decision of the legislative body in 1817, not more than fifteen Jewish marriages are allowed to take place in the course of a year, within the town and territory.^a

The revenue of Frankfort amounts to eighty thousand florins, and the public debt to three hundred thousand. The military force consists of a national guard and a corps of four hundred and seventy-nine men,—the contingent to the confederation.

Silk, linen, cotton and woollen stuffs may be mentioned among the manufactures ; the other articles are tobacco, playing cards, printing types, white wax, and porcelain which is little inferior to that of Dresden. But the principal sources of its wealth are its trade with Germany, of which it may be considered the emporium ; the continual commercial intercourse which it holds with the surrounding countries ; the advantages it derives from the navigation of the Rhine and the Maine ; and its two great fairs, the one at Easter, the other in September, which bring together more than sixteen hundred merchants from different parts of Europe.

The people boast that Charles the Bald was born in the town, and that the diets of the confederation are held there ; but in the opinion of some,^b it possesses better claims to

celebrity ; it gave birth to Goethe, and the first German gazette was published within its walls.

^b "In our opinion." M. B.

^c The sugar which arrives at Hamburg is chiefly imported from Brazil and Havanna ; the same article is also imported from the United States, England, France and Holland.

The greater part of the sugar that enters Hamburg, is refined there, and notwithstanding the competition which it has to maintain with England, it exports annually more than 65,000,000 pounds of refined sugar.

^d The greater part of the coffee imported into Hamburg, comes directly from Havanna, Saint Domingo and Brazil ; the rest is brought from the United States.

^e It may be seen from the above table, that the price of coffee decreased every year from 1821 to 1825.

Commerce of the Port of Lubeck.

Lubeck possesses about	75 trading vessels.
Number that enter its port annually, about	800

^f Indigo is by no means an important article in the trade of Hamburg ; indeed Hamburg and several other states are wholly dependent for their supply on the discretion of England. Indigo in cases comes from the East Indies, and indigo in bags from the West Indies.

^g Ceroons.

^h Although a great quantity of cotton is consumed in Germany, very little is imported into Hamburg ; it receives it from the United States, Colombia and different ports in America, from Egypt, India and the Levant, and also from different mercantile houses in Italy.

ⁱ Most of the English vessels carry ballast to Hamburg, and return with cargoes to England, a proof that many articles from Hamburg, are destined for the English markets.

BOOK CXXV

EUROPE.

Europe continued—Germany.—Ninth Section.—Description of Bohemia.

To complete the description of Germany, some account may be given of the different possessions of the Austrian monarchy, situated in that country. As Hungary and its dependencies have already been described, it is unnecessary to mention them farther; care must also be taken not to confound provinces which, from the manners, language and origin of the inhabitants, should be considered separately, for the geographer observes in the Austrian empire, within a much smaller compass, the same confused assemblage of heterogeneous parts, as in the vast empire of Russia.

Bohemia, which is now to be described, is a country, both in its physical and political geography, wholly distinct from the territories that surround it. It is equal in superficial extent to about nine hundred and fifty-three German or eleven thousand four hundred and thirty-six English square miles.^a

Bounded by Bavaria, Saxony and Prussian Silesia,^b it is encompassed by chains of mountains, that form a natural basin, once filled by a Caspian sea, in the depths of which were deposited the calcareous rocks that shall be afterwards mentioned. The fact that all the mountains which form the outline of the basin, have a gradual declivity toward the centre of the country, serves at first view to strengthen the belief concerning the ancient existence of such a sea. The greatest declivities are situated in the most northern part of the basin; thus the Elbe, which traverses that portion of the country, is enlarged by all the streams that descend from the mountains, and throw themselves, either into its channel, or into that of the Moldau, which unites with it. The outlet through which the Elbe leaves Bohemia, in its passage to the North sea, appears to be the same as the one by which the ancient Caspian discharged its waters into the ocean. Part of the sands that now cover the Prussian provinces of Magdeburg and Brandenburg, and the countries of Mecklenburg and Hanover, may probably be attributed to the eruption of the same sea. These hypotheses, founded on facts, are intimately connected with the most interesting department of physical geography.

Four principal chains enclose the basin: that of the Böhmer-Wald or Bohemian forest stretches from south-east to north-west, and joins that of the Erz-Gebirge, which extends from south-west to north-east, till it meets that of the Riesen-Gebirge; the latter follows a contrary direction,^c and unites with that of the Mährisches-Gebirge or Moravian mountains, which passing from north-east to south-west, terminates at the extremity of the Böhmer-Wald. These

chains, as some geographers have remarked, form an irregular four-sided figure. Bohemia, by being thus enclosed, is rendered an isolated country in the middle of Europe, and this circumstance, it may be readily inferred, has had not a little influence on the civilization and political constitution of its inhabitants. The lowest mountains are those which extending from north-east to south-west and south, separate Bohemia from Moravia and Lower Austria. The name of a small chain, the Teufel-Gebirge or Devil's mountains, at the southern extremity of the Böhmer-Wald, near the sources of the Moldau, seems to have some connection with an ancient idolatrous worship.

The Böhmer-Wald is a primitive chain, composed of granite, gneiss, micaceous schistus and sienite, and lastly of argillaceous schistus or slate and various other rocks belonging to the same epoch. The same substances are observed in the south, near the town of Krumau, on the banks of the Moldau, and also in the Erz-Gebirge, which has been already mentioned in the account of Saxony. The central mountains of Bohemia, or those which extend along the right bank of the Elbe, and join the Riesen-Gebirge, are less remarkable for their height than their rounded sides and summits, proofs that the rocks which compose them are of igneous origin. Even to the lowest declivities which terminate at some leagues to the north of Bunzlau, these mountains exhibit sandstone, basalt and other rocks that appear to have been modified by the action of subterranean fire. They are surrounded by calcareous deposits, abounding in fossil shells; thus, in the midst of the sea, which occupied the basin, volcanoes emitted torrents of lava. The same rocks which are observed in the Böhmer-Wald, are also exhibited on the side of the Riesen-Gebirge towards Bohemia; but the lowest declivities contain sandstone and limestone in parallel strata. Sandstone of a very soft texture, and which disintegrates easily, abounds in the Moravian mountains, particularly towards the north; it assumes the most singular forms, and at a distance deceives the stranger, who imagines he sees towers and villages, where no habitations are to be found. If the traveller descends these mountains, the sides of which are covered with forests, he may observe throughout the whole basin of Bohemia, calcareous rocks, that were deposited at the time when it was filled with water. The limestone is in many places covered with other deposits; rocks consisting chiefly of amphibole,^d and which hold an intermediate place between the primitive and secondary formations, are situated in the western part of the basin, in the neighbourhood of Plan. Granite and argillaceous schistus are not less common near

^b Also by Moravia and Austria on the south-east and south.

^c From north-west to south-east.

^d "Amphibolite," primitive trap.

Tem; alluvial deposits containing fossil wood and iron ore, which yields sixty-two parts of metal in a hundred, may be observed in the vicinity of Pograd, to the south of Eger. These alluvial deposits rest on micaceous schistus, and similar arrangements are remarked near Prague, between Marienbaden and Ogerloch. The Commerberg, a volcanic cone, not far from Eger, is covered with lava and scoriae, and other heights of the same kind extend at different distances to Carlsbad.^a Traces of volcanoes are observable near Tœplitz, and also a sort of red porphyry, from which the celebrated mineral springs take their rise. Horizontal layers of marly limestone rest on the porphyry, but in some places, its displacement has given them a very considerable inclination. Lastly, the Mittel-Gebirge or central chain of the country, which extends along the course of the Elbe, appears, according to a German geologist,^b to have been the centre of the volcanic phenomena, that have left so many traces on the southern declivities of the Erz-Gebirge; basalt and other rocks of an igneous origin are seen there in every direction.

Although the volcanoes in Bohemia belong to that class which burned before the period, when the earth was inhabited by man, yet the country is still subject to shocks, occasioned by subterranean fires. Several took place in the month of January, 1824, in the chain of the Erz-Gebirge and in the districts of Eger and Elnbogen. Their direction was from north to south, south-west and south-east; they were accompanied in some places with a noise resembling thunder; in others many springs were dried up.^c

A country in which the rocks are so various, and the volcanic remains so numerous, abounds generally with mineral springs; at least Bohemia forms no exception to the rule. Such as are most resorted to, are situated in the northern districts; it may suffice to give the reader some notion of their number and celebrity, to mention the springs of Sedlitz, those of Satzka in the district of Kaurzim, and those of Strobnitz in that of Bechin, the alkaline springs of Bilin, Carlsbad and Tœplitz, the ferruginous springs of Bechin near Trautnau, the baths of Kleinkuchel in the district of Beraun, and those of Tetschen in that of Leitmeritz, and lastly, the ferruginous springs of Eger.

The two principal feeders of the Elbe are the Moldau and the Eger; the first traverses Bohemia from its southern extremity to Melnick; the length of its course is more than a hundred and thirty-five miles.^d From the Teufel-Gebirge to Prague, a distance of about ninety miles,^e it has a fall of two hundred and sixty-nine feet. The Eger, which rises in the Fichtel-Gebirge near its junction with the Bœhmer-Wald, and enters the Elbe at Theresienstadt, has a less rapid course, for its fall does not exceed a hundred and fifty-eight feet in a distance of seventy-nine miles.^f ^g

Several extensive lakes are situated in the country; the largest are that of Teschmitz in the district of Klattau, that of Plokenstein in the mountains of the same name, and that of Kummer in the district of Saatz. But the number of ponds is much greater; in 1786, they were reckoned at more than twenty thousand, and according to the calculations that were then made in order to regulate the contributions, their surface was not less than a hundred and thirty-two thousand seven hundred acres;^h their num-

^e "40 leagues."

ber, however, has since been reduced by draining. That of Ezeperka near Pardubitz is one of the most extensive; it contains several considerable islands covered with trees. Many marshes, formed by the annual inundations of rivers, or by the waters which descend from the mountains into the low vallies, are situated in different parts of the kingdom; but as none of them are large, it is unnecessary to describe them.

The climate of Bohemia is modified by the nature of the country, its lofty mountains, extensive plains, and deep vallies. It is temperate in the central districts and on the south-western frontiers, but the mountains covered with forests have an influence on the temperature to a considerable distance from their base. The variation of Reaumur's thermometer at Prague, gives the annual mean term of +7. 7°. It has been proved by registers kept at the observatory in the same town, that the greatest heat is from +23° to +24° of Reaumur, and the greatest cold, about -16°. The thermometrical variations at Eger, in the remotest part of the western frontier, indicate a mean term of +7. 4°, while at Krumau near the southern extremity, it is not greater than +6. 9°.

The most prevalent winds in Bohemia blow from south-east and south-west.ⁱ The east and north-east winds are almost always accompanied with rain, but the north, north-west, and south-west winds, are sure signs of dry weather. The quantity of rain that falls yearly, amounts to eighteen or nineteen inches; the evaporation that takes place in the shade, to fourteen. The average number of rainy days, observed in a series of eighteen years, was annually equal to ninety; the proportion that subsisted between days of calm and cloudless weather, and those in which the weather was rainy, or the sky more or less covered with clouds, was as one to five.^k

No accurate information can be obtained concerning the earliest people that inhabited Bohemia; it is known however that they were subdued, and in a great measure destroyed by the Boii, who under the command of Sigovesus, settled in the country about six centuries before the Christian era. Strabo, Pliny, and other writers, make mention of the same people, from whom the present name of Bohemia is derived.

The Boii experienced for a long period all the vicissitudes of war; their history is confined to migrations, victories and defeats—the results of battles with their neighbours. Ancient writers mention them as possessing at one time the country beyond the Danube, or in other words, the basin of Bohemia, and at another time, the lands between the Danube and the Drave, and lastly, as settled in Thraee and Illyria. Some degree of confusion, therefore, naturally arises as to the countries which they occupied; hence Pelloutier supposes that they all issued from Gaul or Italy. Mentelle appears to be the only author, who has thrown any light on the migrations of the Boii; according to that writer, they accompanied Bellovesus, who marched at the head of several barbarous tribes, in his expedition into Italy. These Boii were then settled on the northern declivities of the Apennines in the present territory of Bologna, and their name seems to indicate that they were only a colony belonging to the nation which occupied Bohemia.

^f "35 leagues."

^g J. M. Lichtenstern, *Umriss einer Geographisch-statistischen Schilderung des Königreichs Böhmen*.

^h "Jochs."

ⁱ The south-east is the most prevalent, and next the south-west. M. B.

^k See Lichtenstern's Essay, cited above.

After the fruitless attempt of Bellovesus, the Boii were repulsed by the Romans, and forced to retreat to the Danube, near the frontiers of Illyria; subdued and nearly annihilated by the Getæ, the country to which they had migrated, remained desert, whence Strabo calls it the desert of the Boii.^a But the great body of the people, who inhabited the basin of Bohemia, were not long secure from the attacks of their neighbours. About two hundred and eighty years before the birth of our Saviour, the Cimbri attempted to subdue them, but were defeated. It was not until thirty or forty years after the vulgar era, that the Marcomanni^b expelled them, and took possession of their territory. The Boii found a new country in the plains watered by the Danube, that form at present a part of Bavaria. It is on that account that Tacitus says, that although the inhabitants are changed, the name of Bohemia still remains, and serves to perpetuate the remembrance of its ancient occupants.^c Although the Boii were driven from their territory by the Marcomanni, they held no mean reputation in Germany; they joined the Helvetii, and invaded Gaul, while the Ædui resisted Cæsar;^d after the defeat of the Helvetii, the Roman general did not compel the Boii to seek for shelter in the Hercynian forest, but in consideration of their valour and courage, and at the request of the Ædui, he made over to them a part of the territory of the latter. Thus, it appears from these details, that the Boii have several times changed their country; but it must not be inferred that their different possessions were inhabited by five distinct people of the same name; on the contrary, it was the same people, who at different epochs settled in five different countries.

According to Tacitus, the Marcomanni were the most powerful people of any in the territories between the Danube and the Hercynian forest; the fact that they conquered Bohemia, may confirm the opinion of the historian. They were governed by kings, chosen from the most illustrious families of their nation, but after the reign of Augustus, the Romans placed foreign rulers over them. Rome, however, did not assist these rulers with her arms, but supplied them with gold and silver.^e Maroboduus is of all the native princes, the one most frequently mentioned in the annals of Tacitus. Strabo informs us that after having passed his youth at Rome under the protection of Augustus, he was called to govern his countrymen. The commencement of his reign was prosperous; he led the Marcomanni to the conquest of Bohemia, and made himself master of the country inhabited by the Boii. He subdued several neighbouring states, and enriched himself with their spoils. He possessed great influence over a portion of Germany, and formed a league, consisting of the Hermunduri, Quadi, Semnones, Longobardi and other nations, against Hermann or Arminius, who had become formidable after having defeated the legions of Varus. But in this contest Maroboduus was unsuccessful; in vain he implored the assistance of the Romans; they saw with secret joy, the enemies who had resisted their yoke, weakened by divisions amongst themselves. Abandoned by his allies, without authority over his people, Maroboduus had no other resource than to implore the protection of Germanicus,

who granted him an asylum in Italy, where he passed the rest of his days.

The descendants of the Marcomanni, at the time when the Roman power began to decline, were compelled to give up their country to different nations, whose names were hardly known to the Romans. These nations migrated from Poland and the north of Hungary, and were known by the general denomination of Slavi. The time when they first invaded Bohemia is uncertain; indeed little is known of their history before the sixth century. They were called *Tchekhes*^f or *Czechs* by the western Slavi, a name, which in their language signifies the *First*, probably because the country they inhabited, was nearest to Germany. Their government was at first republican, but through fear lest they should be expelled from Bohemia by the Avars and the Huns, they chose a sovereign, who, if tradition may be credited, was Samo, a Franconian merchant, a man of wisdom and courage; he governed them for a number of years, and freed them from the yoke of the Avars. A regency was appointed at his death, and it continued until *Krock* was elected; that prince was succeeded by his daughter Libussa, surnamed the magician, who reigned with Przemysl^g her husband, between the years 722 and 745. The sovereignty was hereditary for several generations, but the early part of the Bohemian history is involved in obscurity. Little is known concerning it, before the middle of the ninth century; until that period they continued in idolatry, and had to oppose at the same time, the attacks of the Germans, and the sermons of the monks, who were continually sent from Rome. Fourteen princes and the grand duke Borziwoy^h were baptized in the year 894, and Prague was erected into a bishopric in 972, during the reign of Boleslaus II.

The dignity of grand duke was elective until the middle of the eleventh century. Brzetislawⁱ was the first, who enacted a law in the year 1053, making the succession hereditary, but the law did not continue in force long after the death of the prince. Otho the First conquered Bohemia, and added it to the empire in 1086. Henry the Fifth conferred on duke Brzetislaw the Second, the title of king, in 1086, and from that period the monarchy was elective.

The country was much improved by the German colonists that settled there during the ninth century; for Bohemia, isolated from other nations, did not emerge from barbarism before the introduction of Christianity, which by opening communications with Rome, prepared the way for the civilization of the Slavi. About the beginning of the thirteenth century, Ottocar encouraged German workmen and artists of every kind; under the same prince, industry was diffused in the towns, and commerce freed from its shackles. Order and tranquillity were maintained, and written laws were kept in the principal cities. His successor, Ottocar the Second, who was called to the throne of Austria, extended his power not only over Bohemia, but over a part of Silesia, Poland and Prussia. Possessing the same views, he continued the work of his father, protected the arts and sciences, and encouraged the introduction of the German language, as the great means of enlightening

ⁱ Wratislaus.

his subjects. The manners and language of the people had undergone great changes about the commencement of the fourteenth century; at that time the laws were written in German. Prague, which was one of the most important cities in Germany, became the seat of the arts and sciences.

The emperor Charles the Fourth had been elected king of Bohemia, but the states of the kingdom declared the monarchy hereditary in his family. It was to the same prince that the capital was indebted for its university. Wenceslaus, his son and successor, reformed the laws, and substituted the national language in the different courts. John Huss and Jerome of Prague, flourished in the same reign; but the inhabitants were too ignorant to appreciate their wise and enlightened views concerning religious reform, their virtues, talents and noble disinterestedness. These apostles of the reformation appeared in the world at too early a period; they were not understood, their characters were calumniated. Intriguing persons made use of their own expressions to excite a civil war, which although it may have rendered Ziska, the brave and disinterested chief, illustrious, served only to protract the existence of abuses, which good men wished to see abolished. The monarchy became again elective after the death of Wenceslaus.

Ferdinand, archduke of Austria, obtained the sovereignty in 1526; his reign forms an epoch, not only because the hereditary succession was established in his family, and the prerogatives of the Bohemian states were restricted in the election of their kings, but because in his time, great advances were shown to have been made in knowledge. The prince endeavoured in vain to check the progress of civilization; it was in vain that he protected the Jesuits, and banished all those who were thought favourable to the reformation; neither was it attended with any advantage that censors prohibited books from being sold or published in his dominions; the impulse which had been given to the age could not be checked. The art of printing diffused among the wealthy classes, the writings of the ancients, and the most admired compositions in every language. If many read the works of Erasmus, it was partly Ferdinand's fault, because he permitted a translation of them to be dedicated to himself; so far at least, he weakened unknowingly the effects of his system.

Ferdinand's successor, Maximilian the Second, followed a different line of policy: wise and tolerant, he granted in 1567, the benefits of religious liberty to all his subjects; but those who opposed freedom of conscience, failed not to excite obstinate fanatics to resist the protestants;—violent controversies, reiterated complaints and exorbitant demands were the fruits of his liberal system. Matthias, who reigned next, thought fit to impose new restrictions on the protestants; in place of controversies, insurrections and revolts ensued. The thirty years' war added to the calamities of Bohemia; its population was diminished, its finances were exhausted. The effects of such evils might have continued for a long period, had not Maria Theresa appeared and removed them. It is to that empress that Bohemia owes the abolition of slavery, and the freedom of industry; to the same celebrated woman the country is indebted for many wise laws, a better administration of justice, an improved system of education, and different institutions which, although not to be compared with those that have recently insured the prosperity of several European states, are not on that account the less beneficial to a people, whose rulers adopt slowly the improvements of enlightened governments.

According to the federative act of 1815, Bohemia forms a part of the Germanic confederation. As an integral portion of the Austrian monarchy, the succession to the throne passes in a direct line to the different members of the reigning family. According to the fundamental law of the kingdom, its political organization remains on the same footing as in past ages. The king, at his coronation, takes an oath not to alienate the kingdom, to respect the constitution, protect the states, and preserve the privileges conferred on them by the emperors Ferdinand the Second, Ferdinand the Third and their successors, to maintain justice, and support the catholic religion with all his power.

The states are divided into four classes; the clergy, the higher nobles or lords, the petty nobility or knights, and, lastly, the royal towns. Their deputies form a general assembly, as often as they are called together by the king, who appoints a commissioner to preside over them. Their functions are very limited; they may deliberate on the means of executing what is proposed by the crown, but they cannot petition, much less can any proposition emanate from them, without the authority of the government or of the commissioner who represents the government; for, according to Lichtenstern, the king of Bohemia is, as he has always been, absolute sovereign of the country. In these assemblies, the clergy, who by a law of Ferdinand, are superior to the other states, take an oath of allegiance to the crown. They are represented by the archbishops and bishops, the grand prior of the order of Malta, and the other prelates in the kingdom. The princes, dukes, counts and barons are the members of the higher nobility, and the eight most important offices in the state must be filled by individuals belonging to that body.

Although the number of royal towns is not less than forty-eight, four only are entitled to elect deputies. These privileged towns are Prague, Budweis, Pilsen and Kuttenberg. Other towns are directly subject to the government; three of them, Saatz, Kommotau and Kaaden, are represented. The protected cities, as they are called, form a third class; although they may be situated in seigniories, they are freed from seigniorial burdens and imposts. Most of the towns having mines in their territory, belong to the last class.

Although these distinctions exist, and others by which the peasants are divided into four classes, namely, the proprietors of land, the tenants of houses,^a farmers or tenants of land, and, lastly, the day labourers or workmen, still in the administration of justice, the law acknowledges no difference in individuals, and the police watches with equal vigilance over them all.

The unjust laws that have been passed against the Jews, show not only the striking difference between the Austrian government and the more enlightened governments of Europe, but serve to keep up in the minds of the Bohemians, prejudices as inveterate against the same people as those that existed in the dark ages. The hatred and contempt in which the lower orders of Christians in different nations hold the Jews, may be explained by those who know how difficult it is to eradicate false opinions, strengthened by religious belief. But it is not so easy to explain why those who are called to the government of the state, participate in the same errors. The degraded state of the Jews in Bohemia must be imputed to the government under

^a "Proprietors of houses."

which they live; if they are the worthless and despicable set of people they are supposed to be, the necessity of reclaiming them seems to be more urgent. But the Jews cannot be reformed, nor can they be made useful members of the community, if they are suffered to remain in ignorance, if they are rendered indifferent as to character, and if the law is made the echo of the popular prejudices against them.

Some necessary consequences of the Austrian policy in this respect, may be briefly mentioned. All agree that the Jews in Bohemia have made no advances in civilization for more than half a century. They observe strictly the fundamental principles of a religion that separates them from other nations. They refuse to drink out of the glass that a Christian has used; they abstain from wine on their journeys, if none can be got which has been put into casks or bottles by their brethren; the flesh of every animal slain by a Christian is considered unclean.

It ought, on the other hand, to be recollected, that the Christians in Bohemia have committed flagrant acts of injustice against the Jews; it has been determined more than once to banish them the kingdom, and the sentence has been as often averted only by pecuniary services or presents to men in power. A law was enacted in 1817, for the purpose of preventing their increase, by which no woman can marry before the age of eighteen, and no man before that of twenty-two. If any enter into wedlock at an earlier period, such marriages are null, and the rabbis that celebrate them are banished. Can it be supposed, after the statement of these facts, that the Jews in Bohemia enjoy all the privileges of other citizens, that their property and wealth are equally secure? Government has shown its regard for them by putting them without the pale of ordinary legislation. If two persons are prevented from marrying because the one is only seventeen and the other only twenty-one years of age, what else is it than to encourage immorality and adultery? It is by such means that profligacy and seduction may perhaps become common among a people who, whatever their faults may be, are an example to Christians for conjugal fidelity.

The author from whom these details have partly been taken,^a commends the oppressive measures of the Austrian government against the Jews, a proof that great acquirements are not incompatible with unfounded prejudice. If he may be believed, the Jews cannot be enlightened by education, they are altogether destitute of generous sentiments. It was rightly maintained thirty years ago,^b continues the same author, that the number of Jews in the kingdom was a great evil; they have always been the objects of popular hatred, but their gradual increase may render vain both the vigilance of the police and the *wise laws* that have been past against them. The facts on which M. Lichtenstern founds his opinion shall be afterwards examined; certainly much weight cannot be attached to them, if they be confined to the pretended crime of usury, and the commercial superiority which distinguishes the Jews, and excites the nation against them.

Before the edict of Joseph the Second was passed,^c it might have been inferred from the rigour with which as many were punished as were suspected of being protes-

stants, that the whole nation was devoted to the church of Rome. But no sooner was liberty of conscience proclaimed, than whole towns became suddenly Lutheran. Although protestants of almost every denomination have since that time been protected by government, still they are not very numerous; the proportion between them and the catholics is nearly as one to thirty-three. Thus, notwithstanding the edict of Joseph the Second, the cloisters are as thickly peopled as formerly; the number of convents is not less than seventy-six,^d but only five of them are inhabited by women.

The archbishop of Prague is styled a prince of the kingdom, and receives from Rome the title of legate of the holy see; he as well as the other bishops are nominated by the king; the pope merely confirms their appointment. No bull can be published in the kingdom without the consent of government. The highest spiritual courts which the protestants acknowledge, are the consistories of Prague and Vienna.^e The Jewish worship is under the direction of a council, the members of which are the great Rabbi of Prague, and two assistants.

The present population of Bohemia is not accurately known; according to the last census, that of 1818, it amounted to 3,275,866 inhabitants; in that number there were 1,520,934 males, and 1,754,932 females. It appears from the most authentic accounts, that the country did not contain more than 2,887,769 inhabitants in 1791, so that the increase in a period of twenty-seven years, was equal to 388,097 individuals. The population in 1827 may thus be nearly ascertained by a very simple calculation; in short if the third part of 388,097 be added to the census of 1818, then the result gives nearly the number of inhabitants in 1827. The population of 1827, thus calculated, amounts to 3,405,231 individuals, but that number is rather under than above the truth, for the years that have elapsed since the peace, have been favourable to population.^f

The inhabitants consist chiefly of three distinct people: the Tchekhes or Slavonians, the Germans and the Jews. The first form two thirds of the population in the kingdom. The circle of Elnbogen is wholly, and other circles are partly peopled by Germans; their total number does not exceed eight hundred and fifty thousand; as to the Jews, they may be equal to fifty thousand.

Most of the Germans who settled in the country about the ninth century, migrated from Saxony, and were employed in working the mines; the rest were almost all artisans, who came from different countries on the banks of the Rhine, at that time too populous, and settled in the towns. They were so numerous in Prague, at the commencement of the fourteenth century, and possessed so great a preponderance from their wealth, that the most important offices were committed to them. The university of Prague, which was founded in the same century, tended to increase their number; for the desire of knowledge attracted many students from Germany, and not a few settled in the country. Lastly, when the partisans of John Huss, who were all of Slavonic origin, were persecuted and obliged to quit Bohemia, the most of their property was confiscated and divided among German nobles, who, like the nobility under Lewis the Fourteenth, enriched themselves with the spoils

German Austrian states and in Galicia are subject to the consistory of Vienna. (Hassel).—P.

^f The time elapsed from 1818 to 1827 is equal to nine years; the increase in twenty-seven years is known; if the third part of it therefore be added to the census for 1818, it gives the population in 1827.

of the protestants, and had no scruples about receiving ill-gotten wealth. If to these causes, so favourable to the settlement of the Germans in Bohemia, be added the protection they acquired when the country came under the government of Austria, for since that period, Germans have filled the highest offices in the state, it may be easily explained, why their influence is so great, although their number is comparatively inconsiderable, and also why their language is so generally diffused. The lower orders among the Tchekhes still retain their language, which together with the German is spoken by the middling classes.

The Tchekhe or Bohemian language is one of those Slavonic dialects which have been styled Bohemo-Polish, by M. A. Balbi.^a It differs from the other dialects, such as the Polish, Croatian and Ragusan, not merely in its grammatical forms, but by its use of the German characters, for in the others, the Roman letters are used. The Bohemians sprung from the Tchekhes, may be easily known by their pronunciation. The German Bohemians retain the Bavarian, Saxon, Silesian or Austrian pronunciation, according as they are descended from the one or the other of those nations, or according as they inhabit the frontiers adjacent to them.

The people in Bohemia are strong and laborious, active and well made. According to calculations published by Rieger and Lichtenstern, three individuals die annually out of a hundred; the proportion between the deaths and births, is as a thousand to a thousand three hundred and forty-four; out of ten thousand infants, a hundred and ninety-nine are still-born; the number of births is to the population as one to twenty-three. The total number of deaths amount to nearly ninety thousand, and of these seven hundred and seventy are violent or occasioned by accidents. But the mortality is not so great in some remote quarters in the districts of Beraun, Bitschow, Bunzlau, Chrudim, Czaslau, Klattau and Prachin; the deaths there do not make up a fortieth or a forty-fifth part of the population. Numerous examples of longevity might be mentioned; there are many individuals between ninety and a hundred years of age. It is stated that in 1801, out of five thousand nine hundred and thirty-five persons, seven hundred and fifty had passed their hundredth year, and twenty-nine were upwards of a hundred and ten. The proportion of natural children at the same period, was nearly eight to a hundred, or seventy-six to a thousand. The mean duration of marriages is about twenty-two years and two months, and the mean number of children from every marriage, about four. One marriage takes place yearly out of every hundred and thirty-four inhabitants, and the total number of married men in 1817, amounted to 569,793. It may be worth while to compare some of these facts, which relate only to the Christian population, with others relative to the Jews; among them the number of deaths is hardly one in sixty-two, but the number of births does not exceed one in forty-three.

The Germans and Tchekhes differ as much in their character as in their language; they resemble each other only in their strict observance of religious ceremonies, in their devotedness to their sovereign, and in their hatred against the seigniorial nobility. The Slavonians may be distinguished from the Germans by the care which they take of their property, and by their constant desire of add-

ing to it; they are less susceptible of attachment, less faithful in their affections, and more addicted to society, dissipation and amusement. They boast of their prudence, but it consists principally in not trusting their neighbours, particularly the Germans, whom they still consider enemies. In the military service, the soldiers of both nations rival each other in zeal and courage. The mountaineers are distinguished by a greater aptitude for the arts, and by a generosity and a dignity of character, which are rarely observed among the people in the plains.

The stranger, who travels through Bohemia, must perceive a great difference in the dress of the inhabitants; it does not, as in other countries, depend merely on rank or fortune; it serves to distinguish the Slavonian from the German, and the German from the Jew. The Slavonic dress may be known on the mountains and in the plains by its resemblance to the Polish costume. Although some Germans have adopted it, the observer does not confound them with the other inhabitants, the character of their physiognomy is so widely different. These remarks are only applicable to the lower orders; the middling as well as upper classes of society, dress like the French, for the fashions of that country are soon adopted by the gay and the wealthy. The Jews have retained the costume which is used by the lower orders, but they may be easily known, as they are the most filthy class of people in the country.

The food of the inhabitants is very different in different districts, and the cause depends more on the nature of the soil, than on the wealth and poverty of the people. Barley and oat meal, milk and potatoes, are generally used in the mountains, particularly by the labourers; beer is reserved for holy-days. But in the vallies and the plains, where nature is more profuse, the husbandmen have better and more substantial nourishment. The use of animal food is not so rare, and beer or wine is the ordinary drink. The Jews are more sober and abstemious than the other inhabitants; their thin and emaciated forms seem almost to prove that they deprive themselves of the necessary quantity of subsistence. Although in a wretched and degraded state, they never take wine, spirits, or any strong drink to excess; it is the Christian only that gets drunk on festivals and holy-days.

It might be concluded from the consideration in which landed proprietors are held in most parts of Bohemia, that agriculture is well understood, and that the husbandman derives from his fields, whatever they are capable of producing. The truth is, however, that there are few countries where agriculture is not better understood. The cause must be principally attributed to the inveterate prejudices and slothful habits of the peasantry; those districts in which, from the quality of the soil, one might expect to find the most abundant harvests, yield but scanty crops. But in the mountains, on the other hand, poor lands and inclement seasons, though great obstacles to fruitful harvests, have rendered the people more active and intelligent. It results from their efforts that some of the higher districts produce more than is sufficient for the local consumption, and indeed the district of Leitmeritz in the central chain, has been called the *Paradise of Bohemia*. If in the lower part of the country, which is naturally the most productive, a better system of agriculture was adopted, if government excited the husbandmen to labour, by encouraging the circulation of their products, by opening outlets for commerce, and by improving the breed of cattle, which are every

^a Atlas Ethnographique.

where deficient both in number and quality, the country might assume a new aspect, acquire a greater political importance, and become one of the brightest ornaments in the crown of Austria. The breeding of sheep is neglected not only in the chain of the Riesen Gebirge, which contains good pasturage, but throughout the whole kingdom. No reason can be assigned why as valuable sheep might not be reared in Bohemia as in Saxony or Silesia. Sheep are certainly more valuable than goats which are every year increasing in the country. All agree that the Bohemian horses are of an excellent quality; many are kept in different places by government for the purpose of improving the breed,^a and a strong, active and hardy race has thus been naturalized.

The climate of Bohemia does not appear favourable to the culture of the vine; the quantity of wine produced annually is estimated at only 2,600 *eimers* or 540,000 gallons.^b It is however more than six hundred years since the vine was first introduced into Bohemia. Plants were imported by Charles the Fourth^c from Burgundy and the banks of the Rhine; wine, it has been affirmed, was then so abundant as to render it unnecessary to import any from foreign countries.^d

The culture of fruit trees is found to be profitable; their number has increased considerably within the last twenty years, but at that time, however, it amounted to nearly eleven millions, consisting principally of apple, pear, plum, and cherry trees;^e their annual produce forms an important branch of commerce.

The next most productive plants are hops and flax; the first is cultivated in all the more fertile soils; there are two kinds of it, the common and the green hop, the last of which is propagated spontaneously.

All the different trees that are known in Germany, grow in the forests of Bohemia; they yield annually a quantity of timber much more than sufficient for the wants of the people; the greater portion is therefore exported.

The rearing of the industrious insects that furnish honey and wax, is common in most parts of the country; the number of hives belonging to the peasantry cannot be estimated at less than sixty thousand.

The mountains and the forests abound in different sorts of game, some of which multiply in the plains. The rivers, lakes and ponds are stored with various kinds of fish; more than two thousand quintals are sold or exported every year from the seigniorship of Pardubitz in the district of Chrudim. The country is mostly supplied with trouts from the lordship of Bidschow. In some of the ponds, carps weighing from twenty to thirty pounds are not unfrequently taken. Many fresh water pearls are collected in the Moldau, the Elster and other rivers. Salmon are frequently caught in the Elbe, and also the fish which the Germans call the welsfish (*Silurus Glanis*, Linnæus,) that weighs from ninety to a hundred pounds. The same fish attains a greater size in the Danube; next to the sturgeon, it is the largest of any that are found in fresh water.

The head of the silurus is broad and flat; the mouth, which is very large, is furnished with a great number of

small teeth; the back is round and of a greenish black, the belly of a bright green, and black spots are scattered over the body. The fins are yellow, tipped with blue, and dotted with the same colour. The silurus has a voracious appetite; it seeks during the night, the spawn along the banks of the rivers, or the carcasses of birds and quadrupeds which the waters have thrown on the shores. A naturalist affirms that the remains of children have been found in their stomach.^f As it is slow in its motions, and as its fins are short, it seldom overtakes its prey by swimming; it is probably on that account that it remains always during the day under stones or the roots of trees, or in holes. Concealed by the ooze, its dark colour renders it invisible to the other fish; its whiskers^g appear above the mud, and in their movements and size, have some resemblance to worms; the small fish are attracted by the bait, but as it keeps its mouth open, they are not aware of the danger, until it is too late to escape. The silurus grows slowly, and its life is consequently of long duration; it is taken by the hook and the spear; the flesh of the animal is white, soft and fat, but difficult of digestion.

It is difficult to examine any mineralogical collections without being convinced of the fact that Bohemia abounds in minerals. It is in the chain of the Erz-Gebirge that the most extensive works are carried on, while in the southwestern part of the country, the mines so celebrated in ancient times, are now wholly exhausted. The only tin mines in Bohemia and in the whole Austrian empire are situated on the declivities of the Erz-Gebirge; their produce does not amount annually to more than nine thousand quintals. Attempts have lately been made to work some gold mines at the base of the Riesen-Gebirge. More than eight centuries ago, the district of Kaurzin was so rich in that metal, that about the year 998, the single mine of Tobalka, yielded ten thousand^h marks of gold. It is admitted however, that the experiments, which have been hitherto made, have not corresponded with the expectations of the miners; still the gold washings on the banks of the Eule, the Sazawa, the Wottawa, the Lesnitz and other rivers, which flow through alluvial lands, are continued with some success. The silver mines in the district of Tabor, on the side of the Moravian mountains, are not productive. Several copper mines are situated in other districts, but they are not so productive as the lead mines, although the produce of the latter does not exceed seven or eight thousand quintals. The silver mines yield annually about two thousand four hundred marks. The iron mines are without doubt the most important of any in the kingdom; they are worked in almost all the mountains, and the quantity of forged iron thus obtained, is not less than two hundred thousand quintals. Zinc, arsenic and mercury are obtained in different parts of the country; coals are abundant, and the salt springs are sufficiently productive to supply not only Bohemia but lower Austria.

It is sufficient to mention among the numerous mineral springs in the country, those of Tœplitz, Carlsbad and Sedlitz, which are so celebrated that it may be necessary to enter into some details concerning them. The waters of Tœplitz are saline, ferruginous and alkaline; their tempera-

^a The most important establishments of this kind (*haras*, studs,) are those at Blatto, Alt-Bunzlau, Chlumetz, Josephstadt, Klattau, Königgrätz, Nemoschutz, Nimburg, Pardubitz, Pilsen, Pisek, Podiebrad, Prague, Tabor, Theresienstadt and Kladrub.

ture is 117° of Fahrenheit. A German naturalist^a has endeavoured to explain the formation of the seven springs at Carlsbad. As their temperature is very high, he supposes that in the granite in the vicinity, chemical and galvanic effects are taking place, which by the action of non-mineral water, account for the formation of these warm springs. According to the same author, the river Teipel supplies this natural laboratory; he founds his opinion on a well known fact, namely, that the springs are not so abundant in dry as in rainy weather, and also on the fact that gas bubbles often escape from the waters of the river. Other naturalists attribute the heat of the springs to central fires in the earth. It seems to be generally admitted that we are not in possession of sufficient facts to enable us to explain these phenomena. It may be remarked that according to the analysis of a distinguished chemist,^b the waters of Carlsbad contain a great quantity of sulphate and carbonate of soda. It has been observed too by an eminent physician,^c that they may be used with success in hysterical and hypochondriacal diseases. The purgative waters of Sedlitz which are exported to every country in Europe, are used perhaps with greater success than the last in the same complaints. They are so well known that it is needless to describe their properties, or to state that they are clear and limpid, and of a salt and bitter taste. It appears from their chemical analysis that they contain sulphate and carbonate of lime and magnesia, as well as carbonic acid gas.^d

It has been already observed that various rare minerals are met with in Bohemia. Some of the precious stones that are used in the arts, are also found in the country. Of these, the garnet, the ruby, the sapphire, the amethyst, the hyacinth, and the topaz, are employed by the lapidary; jaspers, carnelians and calcedonies are used for different purposes. Different kinds of stone well adapted for building, together with marble and serpentine, are common in many parts of the country. Good millstones are obtained in other places, and also a sort of schistus that is converted into excellent whetstones, and kaolin that is used in the manufacture of porcelain.

Industry has made rapid advances in Bohemia within the last twenty years; more than six hundred thousand pieces of linen are annually obtained from its manufactories, and they are sold for more than nine millions of florins. The produce of the tan-works may be estimated at nearly two millions two hundred thousand florins; the value of the hats made in the country, at nine hundred thousand; and that of all the different manufactured articles at more than twenty-three millions, while the total value of the raw materials is not equal to a fourth part of the same sum; thus in that single class of products there is a profit of about sixteen millions of florins, which is divided among the workmen, the manufacturers and the merchants. It may be worth while to mention an important manufactory of lace and blond, which has been established at Hirschenstand in the circle of Elbogen for more than forty years. It furnishes employment to about eight thousand individuals, and the annual produce of their industry is estimated at two hundred and eighty thousand florins. The greater part of this manufacture is disposed of in the Austrian territories; the rest of it is exported to Saxony. From that kingdom, the fine thread is

obtained, while Austria furnishes the common thread and the silk.

It is only necessary to make one or two remarks on the commerce of Bohemia, to account for the jealousy and hatred which subsist against the Jews. The inhabitants reproach them, because they never follow any trade or occupation in which manual labour is required. But there is little doubt, if they were to do so, that they would be as much detested by the working classes, as they are at present by the mercantile class of the community. The Jews themselves seem to be aware of that circumstance, and besides, as most of them have numerous families, how could they be able to maintain their children during a long apprenticeship? They are all brokers or money agents, a profession much more easy than any other, and one which does not require a previous training or apprenticeship; the example of the father suffices for the son. It has been said, that in whatever part of Bohemia the Jews are numerous, the manufacturers are sooner or later ruined. If the statement be correct, it proves merely the want of foresight, or improvidence of the manufacturers. It is probable, that in Bohemia, as in every other country, many manufacturers begin business without a sufficient capital to carry it on. If the tradesman cannot fulfil his engagements with the Jew, but is obliged to give instead of money, his manufactures at a loss, he is very likely to be soon ruined; but ought his misfortunes to be attributed to the Jew? The one sells his money at as dear a rate as he can, and the other is as eager to sell his manufactures or merchandise at the highest price. The great law of commerce is equally applicable to them both.

Bohemia exports not only the products of its manufacturing industry, but those of its agriculture, such as grain pulse and fruits, as well as the surplus timber that its forests yield, are exchanged for colonial produce, sufficient to supply the wants of the people. The countries with which it maintains direct commercial intercourse, are Prussia, Saxony, the grand duchy of Baden and Bavaria. The produce of its fisheries, after supplying the consumption of the country, is chiefly exported to Austria. Nothing perhaps tends more to keep up the commerce of the country, than the annual fairs in different towns; the most important are held at Prague and Pilsen.

Goods are transported on the Elbe, the Moldau and the Eger, in boats that carry from three hundred to twelve hundred quintals. The navigation against the current, is often effected by the assistance of sails, while the north and north-east winds prevail in the countries that are watered by the Elbe. If a projected canal which is to open a communication between the Danube and the Moldau, were finished, Bohemia might derive great advantage from it, and as much perhaps if the principal roads were completed, which it is at present proposed to extend. It is certain that in 1817 their total length was not more than eight hundred and fifty English miles.^e

From the details into which we have entered, the reader may form a correct idea of Bohemia; the principal towns in the same country are yet to be described.

Prague, the capital, is situated almost in the centre of the kingdom. Four quarters extend along the banks of the

^a Gæthe, *Naturwissenschaft*, v. VI. p. 211.

^e "350 leagues."

Moldau, which traverses the city; on one side are built the Old and the New Town, and on the other, Kleine-Seite or the Little Quarter,^a and Hradschin or the Upper Town. The population amounts to eighty-four thousand inhabitants, and the number of houses to three thousand four hundred. The situation of Praguc has been much admired, as well on account of the Moldau, which is about five hundred and sixty yards in breadth, as of the beauty of the neighbouring country, and the distant views of the mountains of Schwein and Petrin, that partly bound the horizon. The town occupies a great extent of ground; it cannot be less than twelve miles in circumference.^b Each quarter has its curiosities; in the Old Town, the stranger may observe a bridge over the Moldau, about eighteen hundred feet in length, supported by sixteen arches, adorned with twenty-eight statues of saints, and built by the Emperor Charles the Fourth in the year 1338. The public buildings in the same quarter, are the Carolin or ancient university, founded in 1371, the townhouse remarkable for an astronomical clock, the work of the celebrated Tycho-Brahe, the church of Thein, in which is contained the mausoleum of the same great astronomer, the fine church of the Holy Cross, the museum of natural history, and the observatory. The streets in the New Town are broad and well built; on an eminence are observed the ruins of the Wischerad, an ancient castle that belonged to the kings of Bohemia; another townhouse is situated in the same quarter; the Hussites threw thirteen members of the municipal council out of its windows. The Kleine-Seite or Little Quarter is still better built than the last; it may be remarked for its fine houses, the church of Saint Nicholas, and the palace of Wallenstein. But in point of situation, the Hradschin or Upper Town is finer than any other quarter; it is adorned by the royal castle, the building of which was continued at intervals for several centuries, and was at last completed by Maria Theresa; the Dome or cathedral, a model of Gothic architecture, rises near the same edifice. Prague possesses a great number of public buildings, many charitable and useful institutions, and several scientific collections and libraries; the library belonging to the university, contains a hundred and thirty thousand volumes, and a manuscript of Pliny.

It is believed that Prague stands on the site of Marobudum, an ancient town of the Marcomanni, so called from their king Marobod or Maroboduus. Ruined by the invasion of the barbarians, it was rebuilt by the Slavonians about the year 611; it had become an important town in 723; its population was very great during the fifteenth century, and not less than forty-four thousand students are said to have attended its university. But the persecution raised against John Huss,^c who was born in the town, and the revolt of the Hussites were fatal to the university; it is not attended at present by more than a few hundred students. Among the different articles manufactured at Prague, are hats, linen and cotton goods, silk and woollen stuffs, Russian leather, nitric acid and glass.

It is unnecessary to describe minutely the other towns in Bohemia; none of them are sufficiently important to require a detailed account. Jung-Bunzlau, a small town, built in 973, on the left bank of the Iser, by Boleslaus^d the Second, contains three thousand six hundred inhabitants, wealthy from their industry and commerce. The small

manufacturing town of Reichstadt is the appanage of Napoleon's son. Leitmeritz, a well built town, does not contain more than three thousand five hundred individuals, and the fortress of Theresienstadt in the neighbourhood, commands a small place of a thousand inhabitants. Lippa is noted for its cloth and woollen manufactures, and more glass is made at Kamnitz than in any other town in the kingdom. The famous village of Warnsdorf, the largest of any in Bohemia, and from its industry more important than many towns in the same country, contains eight hundred houses and some fine public buildings. The two thousand three hundred inhabitants of Tœplitz are enriched by the produce of its mineral springs. Saatz (Bohemian, *Zatecz*;) on the right bank of the Eger, is peopled by three thousand eight hundred persons; it was founded in the year 718 by a wealthy Bohemian noble, the count of Schwach. Carlsbad, celebrated for its pins, needles and cutlery, and still more so on account of its mineral waters, contains two thousand five hundred inhabitants. It is surrounded by forests and high mountains; according to report, the springs which now constitute its wealth, were discovered while the emperor Charles the Fourth was enjoying the chase; one of the dogs had fallen into a boiling pool, and its cries awakened the attention of the royal party; from that circumstance the value of the water, and its salutary effects, were soon afterwards made known. Eger, a town of eight thousand five hundred inhabitants, carries on a trade in cotton, linen, and hemp. Pilsen, which is as populous, is enriched by its cloth manufactories and its four annual fairs. Pisek is supposed to be the best built town in the kingdom. Budweis contains a gymnasium, an arsenal and six thousand inhabitants. Tabor stands on a height, and was formerly fortified; it was celebrated during the wars of the Hussites. Kœniggrätz, an agreeable town of six thousand inhabitants, was at one time more populous; it was fortified by Maria Theresa, and is at present the metropolis of a bishopric, and has several schools and scientific collections. Such are the principal towns in Bohemia; the others are too insignificant to require notice.

There are many institutions in Bohemia, of which the object is to diffuse instruction and knowledge. The number of elementary, preparatory and scientific schools may be sufficient for the wants of the inhabitants; the Jews too have as many schools as they require; nothing more is wanted than that these institutions should be put under a better management, that the methods of conveying instruction should be facilitated and improved. Several individuals have shown their zeal for the arts, by forming themselves into a society at Prague, and by collecting at their own expense different objects of arts that are deemed useful in improving the taste of the young; an academy too is connected with the society, to which students recommended by the members are admitted. Another society has been founded in the same town for the purpose of encouraging and diffusing a taste for the study both of vocal and instrumental music. Seven hundred and eighty poor students, who desire to devote themselves to the sciences or the career of instruction, are gratuitously educated at the university; a fund of one million three hundred and thirty thousand florins is reserved for that purpose. Prague possesses besides the only scientific society in the ancient provinces of the Austrian empire; it holds a considerable rank

^b "Circumference four hours" (*stunden*.)

^c History of Bohemia, by Æneas Sylvius.

^d "Boleslaw."

among the different institutions of the same kind in Europe.

The numerous charitable institutions in almost all the towns may be mentioned to the honour both of the Bohemian government and the wealthy classes in that country. There are few places of any consequence without hospitals for orphans, the infirm and the poor. The expenses connected with these places of charity have been estimated at 2,180,000 florins, and the number of persons admitted into them at more than 3,300. Many beneficent societies have been formed, which administer at all times food to the indigent, firewood and clothing during winter, and pecuniary advances to work people and different individuals to whom such advances may be useful. Other societies have been established in the capital for the relief of widows, and respectable persons in decayed circumstances, such as merchants, lawyers and physicians. Different houses have been built in the same place for affording accommodation to the indigent sick and women in childbed. Funds have been raised for the relief of workmen, who have met with any severe bodily injury, and whose families, but for these funds, must have been left destitute. The most of these institutions are conducted on an excellent plan, and those who contribute to them are aware that their money is much better laid out than if it were given in private or indiscriminate

charity; it may be said indeed that those whom fortune has enabled to mitigate the calamities of others, are not less distinguished by their judgment than by their zeal in the cause of philanthropy.

The revenues of the kingdom amount to more than twenty-five millions of florins; the military force to more than fifty thousand men, exclusively of the *landwehr* or militia. The conscription has been long established in the country. A German geographer* remarks correctly that there are few countries which can be more easily defended in the event of a foreign invasion. It may be observed without entering into military details unconnected with our subject, that it is naturally defended by its mountains, that an hostile army could not advance without great difficulty, and that the more numerous the army, the more easily could it be harassed by troops scattered in different parts of the country. The rivers, forests, mountains and ravines are obstacles which diminish greatly the chances of a successful invasion. But if the advantages which Bohemia derives from its position, are of importance to the inhabitants, they are less so to the Austrian empire. The tactics adopted by the European states, since Napoleon taught them both to defend themselves and to attack others, might be employed with success in a war against that monarchy.

BOOK CXXVI.

EUROPE.

Europe continued.—Germany.—Tenth section.—Description of Moravia and Austrian Silesia.

MORAVIA, or Mæhren, as it is called in Germany, derives its name from the Morawa, a river thus denominated by the ancient Slavonians, but which the Germans call the March. This province is entitled a county or margraviate, and is politically united with Austrian Silesia. Both these countries shall be separately described in the account of their physical geography. The extent of the first is about eighty-six miles from north to south, and a hundred and twenty-eight from east to west.^a It is bounded on the west by Bohemia, on the south and the east by the archduchy of Austria and Hungary, and on the north by Silesia. More than half the country is covered with mountains, which in many places, particularly in the south, enclose agreeable and fruitful vallies. The soil is elevated from five to nine hundred feet above the level of the sea, and it inclines principally towards the south. The March is the largest river in the country; it rises in the Sudetes, flows from north to south, and receives most of the streams that descend from the mountains. It joins the Danube at some leagues from Presburg.

Strata of transition limestone are situated in the central districts; a great variety of rocks, not uninteresting from their position, are observed in the mountains on the east, the north, and the west. Among these there are several coal deposits, less important, it is true, than the coal mines in Bohemia, but which are worked however with profit in the neighbourhood of Rossitz and Blawon, where they occupy the lower part of a basin formed by gneiss. To the south of the coal, the geologist may discover fresh water deposits, characterised by the frequent occurrence of the fossil wood called lignite.^b

The *Alt Vater* rises in the chain of mountains^c that separates Moravia from Silesia; from its height probably it has been called the *Old Father*^d of the Gesenke-Gebirge, the summits of which join those of the Sudetes, which extend to a great distance towards the kingdom of Saxony. From the same lofty mountain may be seen the long and narrow province of Austrian Silesia, extending from south-east to north-west. The length of it in that direction is about an hundred miles, and the mean breadth not more than twenty.^e The *Bischofskappe*, one of the mountains in the above mentioned chain, is about three thousand feet in height; from another, the *Hungersberg*, a lofty cataract descends.

The country on the northern side of the Gesenke-Gebirge is higher than any other part of the two Silesias. Valuable mines of gold and silver were at one time worked there; the most productive were situated on the Hackelberg. According to a tradition, the Mongöls destroyed in 1421 not only the men who were employed in working these mines, but most of the miners in Silesia. Repeated attempts have since been made to open them, but they do not appear to have been attended with much success.

The Austrian province of Silesia has been often visited by geologists; it contains, indeed, sufficient to indemnify them for their labour. On the sides of the Sudetes, the Gesenke-Gebirge, and a part of the Carpathians, may be observed several small detached basins, formed of sandstone, slaty clay, coal, argillaceous iron and porphyry; also metalliferous limestone, containing lead, iron and zinc, the limestone called *muschelkalk*, a formation consisting partly of clay, salt and gypsum,^f argillaceous strata in which different metals are found, and extensive alluvial deposits.^g The coal formations occupy a space of about thirty-two leagues. Granite appears on all the higher points, but gneiss and micaceous schistus are more common in the lower parts of the mountains. Blue clay abounds in the alluvial lands, and it is to that substance that the smooth and level appearance of the Silesian plains must be chiefly attributed.^h

The Quadi, perhaps the most ancient inhabitants of Moravia, were the neighbours and allies of the Marcomanni, who, as we have already stated, made themselves masters of Bohemia. The Quadi were the same people that Strabo calls the *Coldui*;ⁱ their history is very obscure until the time of Caracalla, by whom Gaiobomar, their king, was put to death. Tacitus makes mention of them in his annals; he informs us that the Suevi were placed by the Romans between the March and the *Cusus* or *Waag*, and that Vannius or Wann, one of the Quadi by origin, was appointed king over them.^k The above passage proves the great antiquity of the name of the river, which the Slavonians call at present the Morawa. The Quadi united with the Marcomanni, and were sometimes formidable to the Roman power. Domitian marched against them to punish them for having assisted the Daci; the Quadi proposed peace, but the emperor rejected their conditions with disdain; after having been defeated, however, he was compelled to make it on disadvantageous and humiliating terms. The Quadi endeavoured several times to extend their terri-

^k Tacitus, Book II. § 63. inter Marum et Cusum.

tory beyond the frontiers of Pannonia.^a Marcus Aurelius, in order to check their invasions, was obliged to station an army of twenty thousand men amongst them. Their history exhibits a series of defeats and revolts until the time of the emperor Numerian, who gained a decisive victory over them. According to Mentelle, they possessed four important cities: *Eburodunum* (Bria,) *Eborum* (Obruntz,) *Celementia* (Kalmins,) and *Mediostanium* (Znaïm.)

Beyond the Marcomanni and the Quadi, says Tacitus,^b were other less powerful tribes. In the number of these tribes, he includes the Buriï, who inhabited the country which forms at present Austrian Silesia. They resembled the Suevi in their manners and language. Ptolemy calls them the Luti.^c

The descendants of these nations founded in the seventh century, the kingdom of Moravia, which extended to Belgrade; the Slavonians directed their conquests to that country, two hundred years afterwards, and Moravia was joined to the kingdom of Bohemia. It then became a margraviate; but since the reign of Matthias, king of Bohemia and Hungary in the fifteenth century, Moravia has not been governed by separate margraves.

The Slavonians, three times more numerous than the Germans, inhabit chiefly the central districts, and the Germans, the mountains. The former are divided into several branches; the *Hannacks*, the *Straniacks*, the *Slowacks* or *Charwats*, the *Horacks* or *Podhoracks*, the *Podzulacks* and the *Wallacks*. The Hannacks derive their name from the small river Hanna, and they differ from the other inhabitants in their language, customs and dress; their principal wealth consists in their cattle and flocks. The Straniacks inhabit the districts near the confines of Hungary. The remaining tribes may be easily distinguished from each other, but the Wallacks are the most remarkable of any; they were not originally natives of Wallachia, as one might suppose from their name, which appears to be derived from the Waag or Waha, for they were formerly settled on its banks, before they migrated to the western declivities of the Little Carpathians. The Wallacks speak a Bohemian dialect, and wear the Hungarian costume. Before the eighteenth century, while immense forests of beech and maple trees covered the mountains which they inhabit, they carried on a lucrative trade in wood and tinder.^d Now that the woods have been cleared, they are obliged to devote themselves to agriculture; still however they collect the last substance, but in place of exporting as formerly a hundred wagon loads every year to Leipsiek, not more than five or six are at present sent there. The Wallacks are distinguished from their neighbours by their cleanliness. They are brave in war, tolerant in their religion, and strictly honest in the ordinary transactions in life.^e

The Slavonic language, spoken by these different tribes, is a corrupt branch of the Tchekhe or Bohemian. Although it abounds in consonants, it is rich and harmonious, and adapts itself easily in vocal music, to the different intonations of the voice. The literature of the same language is more ancient than the Polish.^f Its principal monuments are a hymn composed about the year 990 by bishop Adalbert, the Bohemo-Latin psalter of Wittemberg, written in the twelfth or thirteenth century, the poetic chronicle of Dale-

mil, which dates from the year 1310, and the translation of the Bible. It was much cultivated by the scholars and learned men in Bohemia, but many of their works were burnt or destroyed during the religious and political wars in the fifteenth and seventeenth centuries. The study of the language has been encouraged for the last twenty years by the Austrian government, and in the course of the same period many original Slavonic works have been printed. Two Slavonic newspapers and three or four literary journals are at present published. A work is now appearing in numbers at Vienna, which is to consist of three hundred ancient Slavonic songs, which have been collected in the different circles of the monarchy.

The different dialects of the Bohemo-Polish, spoken by the different Slavonic tribes, may still be distinguished, not only in Bohemia, but in Moravia and Silesia, although many German words have been introduced into them. The Hannack is harsh in its pronunciation; the Slowack is divided into two sub-dialects, the Moravian Slowack, which is spoken by the Slowacks and the Wallacks, and the Silesian Slowack, differing principally from the former by a mixture of Polish and German vocables; both are said to excel the other dialects in harmony and softness.^g

The German nation is also subdivided into four branches, which are distinguished by the following names: the *Hochländer* or Silesians, who inhabit the Gesenke-Gebirge; the *Kuhhändler*, who occupy the eastern part of the country; and the *Paganers* and the *Schönhangstlers* on the eastern declivity of the Moravian mountains.

The other people that migrated at a later period to Moravia, are the Germans who settled in it during the thirty years' war, the Croatians, who are easily known from the other inhabitants, in the seigniorship of Dürnholm, the French in the seigniorship of Gœding, and the Jews in the different trading towns.

When Joseph the Second established liberty of conscience within his dominions, many appeared suddenly throughout Moravia, who had preserved in obscurity the doctrines of John Huss, or the principles of Luther and Calvin. The Moravian brethren, who had acted three centuries before that period, an important part in Moravia and Bohemia, but who since the reign of Ferdinand, had continued, like the other protestants, under a system of persecution, then appeared in great numbers. The Wallacks exhibited in their mountains, the curious spectacle of a people declaring against catholicism, without being resolved to substitute any other worship in its place. Not many years after the decree of Joseph the Second, more than twenty thousand individuals followed publicly the rites of the different protestant churches. Austrian Silesia may be considered in some respects a dependence on the diocese of Breslau, but it contains a great number of Lutherans. The protestant worship is under the direction of the general consistory of Vienna, and the catholics acknowledge as their spiritual chiefs, the bishop of Brünn, and the archbishop of Olmütz.

The climate of Moravia, notwithstanding its elevation above the level of the sea, is milder than in many other countries under the same parallel. The vine is cultivated with sufficient advantage beyond the forty-ninth degree.

^f What is here said of the literature of the language, refers more particularly to the language of Bohemia Proper.—P.

^g M. A. Balbi, Atlas Ethnographique.

The greatest height of Reaumur's thermometer is about 28°, but in some winters it has descended so low as 22° below zero. The mean temperature of Olmütz is about 7.3°. But the mountains are exposed to a much more rigorous climate than the central districts; thus the harvests are five or six weeks earlier in Moravia than in the mountainous country of Silesia. At Brünn, for instance, the cherries are fully ripe in June, while they do not begin to redden in Silesia before the first days of August. The north-east wind is the most prevalent in the two provinces.

The country abounds in game and fish; bees, poultry, and the different domestic animals are very common. Cattle form the principal wealth of the Silesians, who, although a sober and industrious people, are not affluent. The corn harvest in the two provinces are more than sufficient for the wants of the population; there is no scarcity of potatoes, different kinds of vegetables, anise, hops, hemp and flax. The vine and many fruit trees are cultivated with success, but of the latter the walnut is the most common.

The mineral productions of the country are very various; gold and silver, it has been remarked, were formerly abundant, but iron and coal are the most profitable at present. Alum, marble and different kinds of rocks are found in many places, and worked with advantage. It ought to be observed, however, that the water in most of the springs in the country is neither wholesome nor agreeable to the taste. With regard to the different branches of industry, Moravia is one of the most important provinces in the Austrian empire. It is unfortunate for its commerce that the March is only navigable for vessels of a very small tonnage; the inhabitants are consequently obliged to transport almost all their merchandise by land. If communications were opened or facilitated, the greatest benefit might result from them; in its present state, however, the revenue of the country amounts to 7,200,000 florins.

The two provinces of Moravia and Silesia have been considered as forming only one since the year 1783; they are divided into eight circles. The rights and interests of the country are protected by the states, the deputies of which are divided into four classes, the clergy, nobility, knights and deputies from seven royal towns. The emperor convokes a general assembly of the states every year, under the presidency of the governor, and after the close of the session, a permanent deputation continues its sittings, until the members are again assembled.

Brünn, the capital of the province, is situated at the base of a hill, between the rivers Schwarzawa and Zwitawa. It is worthy of its rank from its population, which exceeds thirty-eight thousand inhabitants. The ancient fortifications have been partly demolished, and the rest are in ruins; the citadel only remains, and serves at present as a state prison. The ancient convent of the Augustines is now the place where the states assemble; in their hall may be seen the plough, with which Joseph the Second, after the example of the Chinese monarchs, turned up a field in the neighbourhood of Rausnitz. The *Kraut Markt* or cabbage market has been considered the finest square in Brünn; it is adorned with a magnificent fountain. The two most remarkable of the nine churches are those of St. James and the Augustines in *Alt Brünn* or the old town. The

first of a light but bold Gothic architecture, is covered with copper, and contains a great many statues; in the second is observed a silver altar, surmounted with a picture of the virgin, worthy of Cranach's best days. A manuscript of the fourteenth century is preserved in the church of St. James; it contains an account of the siege of Troy, taken from two ancient Greek manuscripts at Athens, written by eye witnesses of the siege.^a The glacis has been transformed into public walks. The Spielberg, a hill of eight hundred feet in height, rises near the town; part of it, called the Frandzensberg, was formerly a Calvary. A marble obelisk sixty feet in height, consecrated to the glory of the Austrian armies, was erected in 1818 in the midst of a wood near the arid rocks, which crown the Spielberg. These walks command an extensive view, and the spectator observes at twelve miles distance to the south-east, the field of battle, and the village of Austerlitz. Brünn contains several hospitals, schools and seminaries, an agricultural society, another of natural history,^b and a valuable museum, which has been placed in the episcopal palace. The commerce of the town consists principally in the sale of its hats, silks and woollen stuffs.

The burgh of Buchlowitz, about four leagues to the east of Austerlitz, contains a population of thirteen hundred souls; it is known from its sulphureous mineral waters. The village of Luhatschowitz is situated in the mountains, at a greater distance from the capital; its baths are much frequented; the fountains of Vincent and Armand are surrounded with handsome buildings in the form of temples; many afflicted with rheumatism and cutaneous diseases repair to them every year. The burgh of Tolleschowitz derives its wealth from its vineyards, which yield excellent wine. Some ruins that may be observed in the neighbourhood, are supposed to have been once inhabited by saint Cyrilus, the first bishop of Moravia. The ruins of the first church which was built by the same bishop may still be seen at Hradisch. That town is the capital of a district, and is situated in a fruitful plain, but exposed to the frequent inundations of the March. It stands on an island in the middle of the river, and contains fifteen hundred inhabitants. Its position has rendered it necessary to erect and keep up thirty-nine bridges, one of which is more than three hundred yards in length. Hradisch was an important fortress in the fifteenth century; Matthias, king of Bohemia and Hungary, besieged it several times without success. Four sabres are deposited in the townhouse, which were given to the city by king Wladislaw to commemorate the bravery of the citizens. The market place is adorned with a fine statue of the virgin.

The village of Strany on the mountain of Jaworzina, is peopled by the Wallacks, that have been already mentioned; they differ from the other inhabitants in their manners, language and dress; during festivals and holy days, the people join in a national or characteristic dance,^c in which they wield their sabres with great dexterity. From the top of the heights in the neighbourhood of Strany, which form the frontiers of Moravia, a good eye can distinguish at thirty leagues distance the tower of St. Stephen.^d

The commercial town of Nicsburg rises in the midst of a plain, near the southern extremity of the province; it

^a The manuscript in the church of St. James is entitled: *Liber historiae Trojanæ, per magistrum Guidonem de columnis de Nessana, de Græco translatus in Latinum.* Guido died in 1287; the copy of his MS. was not written by himself, but by a German of the name of Grunhagen, as is proved by the last sentence in the work: *Explicit historia seu chronica*

Trojanorum, scripta per Johannem Grunhagen, Anno Domini 1348, &c. See Archiv. für Geschichte, 1825.

^b "A society of agriculture and natural history."

^c Called the robber's dance.

^d Rudolph Von Jenny, *Handbuch für reisende in dem Oesterreichischen Kaiserstaate.*

contains seven thousand inhabitants, nearly half of whom are Jews. Znaïm, a town of the same population, including its three suburbs, is situated on the left bank of the Taya, in a fruitful country, covered with rich vineyards. The principal edifices are the court of justice, and the church of St. Nicholas, remarkable for its fine Gothic architecture. The chapter of Pœltemberg is separated from the town by a deep valley; it belongs to the knights of the cross. Znaïm possesses two convents and a gymnasium. The burgesses wear a blue dress, and their wives are distinguished by their high bonnets trimmed with gold lace. The burgh of Eisgrub is also built on the banks of the Taya; at no great distance from it, is a rural castle, belonging to the prince of Lichtenstein; the building is not very large, but the park which surrounds it is watered by the river, and laid out with much taste.

Iglau on the banks of the Iglau, lies in the midst of the Moravian mountains; its population amounts to thirteen thousand inhabitants; it has three parish churches, a convent of Minorites, founded by Ottocar the Second, a gymnasium and an hospital. Some fine paintings and several ancient tombs are contained in the church of St. James. The church that belonged to the jesuits, has been admired for its paintings in fresco. A cemetery shaded with lofty trees is the most frequented public walk in the town.

Trebitsch is encompassed with walls, and situated in a deep valley on the banks of the Iglawa; most strangers admire the picturesque arrangement of its houses, the large castle that commands it, its ancient parish church, and the convent of the capuchins. The view from the summit of the Mistkogel, a high mountain with a rounded summit, is as fine as it is extensive; one may observe from it a succession of rich and fruitful plains, extending to Nicolsburg; also the deep and gloomy valley of the Iglau, the ruins of Tempelstein, an ancient castle in which the well is said to be five hundred yards^a in depth, and on the left bank of the Rokitna, the small town of Kromau, commanded by heights covered with trees, so arranged as to exhibit the appearance of a vast and verdant amphitheatre. Coal is not uncommon in these mountains, and the working of it forms the chief occupation of the fourteen hundred inhabitants in Kromau.

A rugged and hilly road leads across the Moravian mountains to Ingrowitz, a small town on the banks of the Swartza; although it does not contain more than eleven hundred inhabitants, it possesses a considerable trade in linen, and serves as a place of residence to the superintendent of the reformed communities in Moravia. Mount Prositschka rises at no great distance from the town; it was there that the ancient Slavonians went to worship their gods; its summit is often obscured with clouds before rain, and on that account it has been called the *Weather-glass* by the country people.^b When the sky is serene, the view from it extends to Kœniggrætz in Bohemia.

Olmütz was the ancient capital of Moravia; its fortifications, which are still in good repair, and its citadel, which was the prison-house of Lafayette, render it an important place in time of war. The population, together with that of the five suburbs, amounts to thirteen thousand inhabitants.^c The town is well built, provincial courts are held

in it, and it is the residence of the archbishop. The lyceum and the other schools are numerous attended, and the charitable institutions are managed with great care. The public fountains, remarkable for their elegance, reflect much credit on Donner, the sculptor. The townhouse is the finest edifice; the lyceum possesses a library of fifty thousand volumes, a valuable collection of natural history, and another of philosophical instruments. The people show the place where the emperor of Austria had an interview with Napoleon a short time before the battle of Austerlitz. Several manufactories have been established in Olmütz, and it carries on an extensive trade in cattle with Poland and Russia. Some antiquarians think it probable that the town is the same as the one which Ptolemy designates by the name of *Eburum*.

The March, which waters Olmütz, descends towards the south, and traverses the plain in which Kremsier, the residence of the archbishop in the summer season, and one of the finest towns in the province, is situated. Nothing can exceed the magnificence of the castle appropriated by the prince of the church; galleries of paintings, scientific collections, libraries, gardens embellished with fountains and cascades, correspond with the architecture of the edifice. The population of the town is not more than four thousand souls. Prerau on the Betschwa, though still less populous, is one of the most ancient towns in the country; within its walls may be observed a very large building, which belonged formerly to the templars. Weiskirchen, peopled by five thousand inhabitants, is situated at a short distance from the Betschwa; it is visited by the strangers that resort to the baths at Tœplitz about a mile and a half distant, a place that must not be confounded with Tœplitz in Bohemia. A precipice four hundred and fifty feet in height, rises near the thermal springs, and a pool of mineral water extends below it.

Such are the principal towns in Moravia; we shall now proceed to enumerate the most important places in Austrian Silesia. Jægerndorf rises in a fruitful valley, at the foot of the Buzberg, on the northern side of the mountains that separate the two provinces. It is encompassed with walls, and depends on a duchy belonging to the prince of Lichtenstein. The mountain that commands it, on the summit of which, a large church has been erected, is often visited by botanists. The town contains four thousand seven hundred inhabitants. Troppau is a strong place with a population of ten thousand souls; it is well built, and the streets are broad and straight; the public buildings are the ancient townhouse, a theatre, several churches, and the ducal castle of Lichtenstein. It contains different manufactories, but its trade consists principally in soap. Teschen, a town of six thousand inhabitants, is situated on the declivity of the Carpathians, in a country covered with forests and pasturage. Weichsel or Vistula, a village to the south-east of the last place, stands in a valley, remarkable for a cataract, which descends from the height of two hundred feet; the springs that supply it, are the sources of the fine river that traverses Poland. Lastly, Bilitz on the frontiers of Galicia, is noted for its cloth manufactories; it contains five thousand inhabitants, and not fewer than the half of them^c are employed in making cloth.

^b " ——— it serves as a barometer to the country people."

^c "3300"

BOOK CXXVII.

EUROPE.

Europe continued.—Germany.—Eleventh Section.—Archduchy of Austria.

THE country about to be described, is mostly enclosed by the different possessions of the Austrian empire, an empire, extending over a number of nations, foreign to each other, governed by the same sovereign, but according to different laws. The inhabitants in some possessions lately added to Austria, attach no meaning to the word patriotism; passive obedience is considered their only duty; in others, that obedience may be attributed to fear rather than to ignorance; the hope of independence still cheers them, and their most earnest desire is to throw off the yoke. The former having submitted to a despotic government for ages, know no other blessing than repose, and have no other wish than to increase their wealth, and by that means, their temporal enjoyments; the latter, jealous of their independence, are apt to suppose they have preserved it, because their countries are entitled duchies or kingdoms. All, in short, are more effectually separated from each other by their manners, customs and language, than by the chains of mountains which divide them.

The archduchy of Austria is bounded on the west by Bavaria, on the north by Bohemia and Moravia, on the east and the south-east by Hungary, and on the south by the duchy of Stiria. The superficial extent of the country is about seven hundred and eight German square miles.^a It is divided by the Ens into two nearly equal parts; the one situated on the left of the river is styled *the government above the Ens*, and the other on the right, *the government below the Ens*.^b

The mountains in the south of Bohemia and the Noric Alps form a large and fruitful valley, which the majestic Danube traverses from west to east. Branches of these mountains extend to the banks of the river; they enclose a great many vallies and small plains, and render the country one of the most agreeable and romantic in Europe. The heights of the Mannhartsberg, and the chain of the Greiner-Wald are not very lofty; but those which extend to the south of the Danube, rise to a great height, and some are covered with eternal snow.^c

^a According to Max. Fred. Thielen, it is equal to 708 $\frac{6}{10}$ German, or nearly 8503 English square miles.*

* "1970 geographical sq. leagues Fr."

^b Germ. *Land ob der Ens* and *Land unter der Ens*.

^c The height of the principal summits in the Noric Alps, has been already mentioned, in the general table of European altitudes; but there are several lofty mountains on the frontiers of the archduchy, which may be specified.

On the west or above the Ens.

The Hochhorn	10,667 feet.†
The Dachstein	9,285

It may be remarked, that the mountains which extend from Vienna to the calcareous chain of the Alps, particularly those of Thomasberg and Meyersdorf, contain several deposits of coal, which are accompanied with argillaceous, calcareous and quartzose sandstones, and with slaty clay and marl, containing marine shells and the impressions of plants. Coal is likewise found at the foot of the Alps, in the valley of the Ens.^d On the east of the same river, formations of different characters and periods, contain mines of iron, lead, silver and coal. The lofty district of Monasberg is covered in several places with alluvial deposits. The number and height of the mountains on the west of the Ens, render the neighbourhood of Salzburg, and the country of Berchtesgaden, more interesting to the geologist. They form part of the Noric Alps, and are composed of granite, sandstone and limestone. Quartz, garnets and other precious stones, amianthus, marble, rock-salt, feldspar and serpentine, as well as most of the metals, are found at different elevations. The calcareous mountains seem to be loftier than the granite mountains, and the illusion is partly occasioned by their steep and rapid declivities. But without having recourse to the barometer, it is not difficult to discover that the granite mountains appear lower, merely because they are seen from a greater distance; indeed at the approach of winter, they are always first covered with snow.

The calcareous mountains are much more interesting to the botanist, on account of their abundant and varied vegetation. The cause of so many plants may be attributed to their geological structure, and particularly to the comparative lowness of their elevation. Lichens and almost all the cryptogamic plants are nowhere observed, while the schistous and granite mountains are covered with them; in the first, springs and streams are very rare; in the others they are very abundant, and the noise of the cataract is often heard amidst precipices, steep rocks and narrow vallies. The land rises gradually from north to south in the country of Salzburg, and if the level of the lowest plains be compared with that of the highest summits, (for instance, the Wisbachshorn,) the difference will be found to be great-

† The measurements here given are those of the original.

^d See the Memoir by M. Riepl, (*Annales de l'Institut Polytechnique de Vienne*, Tome II.)

er than ten thousand feet.^a A belt of land extends from east to west, to the north of Salzburg, through the whole length of the archduchy; it is composed of tertiary sandstone^b and plastic clay, and reposes on a belt of alpine limestone, to which succeed strata of argillaceous schistus, that are supported in their turn by micaceous schistus and the other rocks of the Alpine chain.

Extensive marshy lauds and several well known mineral springs appear on the east and the west of the Ens. Different lakes and ponds are situated in the part of the archduchy above the same river. The two most important are the Atter, which is 7288 *jochs* or Austrian acres in superficial extent, and the Traun, which although not more than 3,777, is better known than the other, from its picturesque situation and the beauty of the neighbouring districts.

The greatest rivers tributary to the Danube, are the March on the north, and on the south the Ens or the ancient *Anisus*, of which the course may be about a hundred and twenty-eight miles,^c and the Traun which issues from a small lake in the Noric Alps near Aussee, traverses the lakes of Hallstædt and Traun, and falls near Lambach in the form of a cascade over rocks sixty feet in height. The latter river has a course of about seventy miles,^d and a canal about three hundred yards^e in length is carried round the falls, so that its navigation is not interrupted.

Having thus described the position, and given a short account of the archduchy, it may be proper to mention its ancient inhabitants. The lands between the Danube and the Alps, were, according to Ptolemy, inhabited by the *Ambilici* and the *Ambidrani*, who were tribes of the *Norici*. The country was known to the Romans by the name of *Noricum*. The districts round Vienna were included in Upper Pannonia, and the left bank of the Danube was peopled by the *Norici* and *Quadi*. The history of the *Norici* is very uncertain, but there is reason to believe that they were governed by kings, before they submitted to the Romans. *Noricum* became a Roman province under the reign of Augustus; it was considered of sufficient importance to be divided into two parts; the one nearest the Danube, was called *Noricum Ripense*, and the other, near and beyond the Alps, was styled *Noricum Mediterraneum*. The principal towns situated on the banks of the river, were *Boiodorum*, (at present Ilzstadt,) *Laureacum* (Lorch,) *Aredate* and *Claudinium*, the sites of which are unknown, *Ovilabis* (Wels,) and *Juvavum* (Salzburg.) While the Romans were powerful, the *Quadi*, *Marcomanni* and other neighbouring nations respected the *Norici*, but they were finally conquered by the *Goths*; *Alaric* devastated their country, which was afterwards laid waste by the *Suevi* and the *Heruli*.

About the sixth century, the *Avars* or *Avari*, a people originally from the vallies of the Ural, invaded and took possession of a part of the archduchy; it is not improbable that they founded there a kingdom, to which the more western nations gave the name of *Æsterreich* or the eastern kingdom. *Charlemagne* made himself master of it, and divided it into several counties. The frequent incursions of the *Madjars* or *Hungarians* induced *Henry the Fowler* to erect it into a margraviate in the year 928, of which the investiture was bestowed on his nephew *Leopold*. *Frederick Barbarossa* changed it into a duchy. It was again conquered in

the thirteenth century by *Ottocar the Second*, king of *Bohemia*; but that prince having refused to render homage to *Rudolph of Hapsburg*, then elected emperor, a war ensued in which *Ottocar* was slain. The duchy thus passed to the descendants of *Rudolph*, who have since acquired the rank and importance that are attached to the house of *Austria*. Such was the origin of the family which courtly genealogists have traced to the time of *Noah's ark*, or at all events to the days of the *Trojan horse*.

The inhabitants have been so mixed by the invasions of which *Austria* has been the theatre, that it is difficult to discover the shades by which they were formerly distinguished. Some *Slavonians*, however, are found on the frontiers of *Moravia*, in the country below the *Ens*. The descendants of the *Norici* exhibit proofs of their ancient origin in the country above the *Ens*. Their language differs from that of the other inhabitants. The people in the district of *Salzach* show in their customs and character, the remains of a distinct race; the most of them are honest and industrious.

The *Austrian German*, less pure than that which is spoken in the centre of *Germany*, forms one of the *Danubian dialects*. A *Bavarian dialect* is spoken in the country of *Salzburg*, and many different varieties may be observed in the rest of the archduchy. All of them abound in diminutives, but none of them are so soft as the *Bavarian*.

The southern part of the country above the *Ens*, is higher, and therefore colder than any other district in *Austria*; the grape arrives seldom at maturity. The climate is milder in the valley of the *Danube*, and the air is every where pure and wholesome. The rain that falls annually varies from twenty-four to thirty inches, and the most frequent winds are the west, the north-west and the east. The climate below the *Ens* is temperate but variable; *Reaumur's thermometer* never descends lower than -19° , and does not ascend higher than $+29^{\circ}$. There are about twice as many fair as rainy days throughout the year.

Although *Austria* is not exposed to the ravages of epidemic diseases, the mortality is, however, more considerable than in the other possessions of the *Austrian empire*. The number of deaths compared to the population is in the ratio of one to thirty-four. The *cretins*, those beings both morally and physically degraded, are very numerous in the mountains near *Salzburg*.

It has been already said that the *Austrians* are laborious, and that the desire of increasing their wealth is observable among all classes of society. For these reasons, agriculture and industry are carried to a degree of perfection, which appears to be incompatible with the general but incorrect notions concerning the indolence of the people. The country, it must be admitted, consumes more grain than it produces, but the insufficiency of the harvests in the governments above and below the *Ens*, ought to be attributed rather to the quality of the soil, than to the ignorance of the husbandmen. Fruit trees are common on the left bank of the *Ens*, and dried fruit forms a branch of exportation; but the orchards on the right bank of the river are more abundant and more valuable; it is believed too that the finest vegetables in the empire are produced in the neighbourhood of *Vienna*.

If the climate be ill adapted to the growth of the vine in the districts above the *Ens*, the culture of the same plant in the rest of the country forms the most important source of

^a F. Ant. Von Braune, Salzburg und Berchtesgaden.

^b Mollasse.

^c "Course 54 leagues."

^d "30 leagues."

^e "700 feet."

agricultural wealth. The best wines are those of Mauerbach, Kloster-Neuburg, Feldberg, Giuzing, Rötz and Bismberg. Hemp, flax, and saffron are cultivated with advantage in the country below the Ens, but as the lands do not yield rich pastures, many cattle are not reared, indeed the number is insufficient for the consumption of the inhabitants. The forests have been long neglected; firewood is consequently found to be too expensive for the poorer classes. The meadows in the country above the Ens are so abundant that more fodder is raised in the government than in any other part of the Austrian empire; and although the coldness of the climate compels the inhabitants to consume a great quantity of wood, a considerable time may elapse before it be necessary to introduce coal, or before the forests which cover the mountains are exhausted.

Lower Austria is amply supplied with some domestic animals,^a and although there may be a deficiency in cattle, it is admitted that the breed of sheep has been improved, that the horses are strong and well made. The excellence of the pastures in Upper Austria has led the inhabitants to imitate the Swiss, in the care they bestow on their cattle and dairy. The forests in that country afford shelter to wolves, bears, chamois and different sorts of game. But as most of the woods have been cut in Lower Austria, game has become less common in that government.

The mines in the archduchy are worked with much intelligence; an author affirms, that if it were not the interest of government to be sparing of fuel, Upper Austria might supply all the hereditary states in Germany with salt.^b The salt mines of Hallein produce nine hundred thousand quintals. The district of Salzach, in mineral wealth perhaps more important than any other, furnishes every year three hundred marks of gold, seven hundred and twenty of silver, three hundred and eighty quintals of copper, four hundred and ninety of lead, fourteen thousand four hundred and sixty of iron, ten of arsenic, and fifty-three of vitriol. Lower Austria derives from its mines thirty-four thousand quintals of iron, and two thousand five hundred of alum; the mines of lead containing silver seem to be nearly exhausted, but the coal mines are much more profitable than ever they were at any former period; their annual produce is about two hundred and thirty thousand quintals.

On the left of the Ens, iron is more extensively manufactured than any of the other metals; it furnishes the means of subsistence to more than fifty thousand families in the district of Traun. There are also numerous manufactories of woollen stuffs, linen and muslin. But the people in Lower Austria are still more extensively engaged in manufactures; in that respect it surpasses all the other possessions of the Austrian empire. Cotton mills,^c linen, cloth, ribbon and paper manufactories, founderies, iron, leather and glass works are to be seen in many parts of the country.^d A geographer estimates their produce at eighty-five millions of Austrian florins.^e

It may be naturally inferred from so great a variety of manufactures, that the commerce throughout the country must be considerable; almost the whole, however, is concentrated at Vienna. The metropolis, from its being the residence of the court, from its position, and from its exten-

sive credit, has long possessed the principal commerce of Austria. Lintz, Salzburg, Steyer, Neustadt, Krems and some other towns serve as intermediate stations to Vienna. The value of the goods exported cannot be valued at less than fifteen millions of florins; the imports amount to the same sum, and the amount of the transit trade may be estimated at five millions. It would be needless to inquire, after the example of some authors, whether the commercial balance, as it has been termed, is in favour of Austria; because it is evident there must be always a balance between the exports and imports of a state, since in every case an equivalent value must be given for the articles imported. Goods are conveyed by water on the Ens, the March and the Traun, but most of all by the Danube; many vessels loaded with cargoes from a hundred and fifty to two hundred tons may be seen on the last river. Merchandise is transported by land along eleven principal roads, three of which in Upper Austria form a total length of three hundred, and eight in Lower Austria of more than six hundred miles.^f

The archduchy exhibits in a religious point of view, as well as in many others, that contrast between privileges and restrictions which characterizes countries, where prejudice and caprice are substituted for justice and right. It is not intended to throw any censure on the government, but merely on the mass of the inhabitants. They showed themselves under Joseph the Second, incapable of deriving any advantage from the institutions and privileges which that monarch was disposed to grant them. It is not however the less singular to observe in the same province, religious liberty established on one side, and intolerance on the other. As in the other states of the empire, the catholic religion is the prevailing form of worship, and the one that has the most partisans in Lower Austria; however, the Greeks, Protestants and Jews enjoy equal protection, and have their churches and synagogues; while in Upper Austria, which contains twenty-four thousand Lutherans, who are allowed the free exercise of their religion, the Jews are not tolerated.

It is known, however, that the differences which exist between the liberties and the privileges of the provinces, depend on the conditions that were stipulated at the time of their union with the crown. The country below the Ens, was originally the grand duchy of Austria; the country situated on the other bank of the river, was annexed at a later period. To the grand duchy were attached important privileges during the long continuance of the German empire; it is from these privileges, and as king of Bohemia, that the Austrian emperor possesses the right of presiding over the Germanic confederation. But according to certain treaties, that have existed for nearly four hundred years, the power of the sovereign is modified by the states, which the emperor by his coronation oath binds himself to maintain. These states are organized in the same manner as those of Bohemia; they consist of the high clergy, the nobility and the deputies from some privileged towns; they are divided into a general assembly and a permanent commission, and can only be convoked by the sovereign. Assemblies of the same sort are held in Upper Austria, and the duchy of Salzburg has its separate states.

^c Lower Austria is the principal seat of the cotton manufacture in the empire. (Hassel.)

^d "Cotton mills and cotton manufactories, tanneries, forges and

founderies, glass-works, paper-mills, and manufactories of hats, cloth, ribbons and mirrors, are the principal manufacturing establishments."

^e Lichtenstern's Geography, (in Germ.)

^f "Total length in Upper Austria, 81 Germ. miles; in Lower Austria, twice that sum."

Upper Austria is divided into five circles, and Lower Austria into four. In the first, a supreme court^a sits at Lintz, and takes cognizance only of the causes of the nobles and privileged classes; three hundred and fifty-five inferior tribunals decide the causes to which plebeians are parties. Six hundred and twelve tribunals have been established for the latter purpose in Lower Austria, while the nobles are only amenable to the supreme court at Vienna, and the common people can appeal to it against the decisions of the other tribunals. Two councils of censors are held, the one at Lintz, and the other at Vienna; it is the duty of the members to examine not only all the works published in the country, but such as are imported from foreign states.

The revenues of Upper Austria amount to about £750,000, and those of Lower Austria to nearly £2,500,000.^b All classes, from the noble to the peasant, are removed beyond the reach of poverty; they may be said to be affluent, when compared with the people in other countries. The advocates of absolute power have attached great weight to that fact, which proves merely that under one despotic government, the nobles do not abuse their privileges, and the people are protected by the impartial administration of the laws; in other words, that frugal and industrious men amass wealth, wherever the right of property is respected. But is man like the lower animals? has he no other enjoyment than that of satisfying his physical wants? has he no other desire than that of living in obscurity or repose? If the Austrians are now happy under a paternal sceptre, the time may perhaps come, when they will envy the destinies of some states in Germany.

Vienna and that part of the Danube which separates the town from the suburbs, are situated in the centre of a fine and fruitful plain. Some travellers commend whatever they see in foreign countries; others, particularly the French, blame whatever does not recal the customs and neighbourhood of Paris; it is necessary to avoid both errors, in endeavouring to describe the large basin round Vienna. Towards the north, the eye follows the different branches of the river, whose broad and rapid course, together with the vessels that cover it, embellishes and vivifies the rich picture. Islands covered with trees, add to the beauty of the landscape in the same direction. The surface of the water opposite Vienna is about four hundred and eighty feet above the level of the sea. The limits of the basin on the east, are formed by heights covered with houses, which unite with those that bound it on the south. The basin becomes broader on the west, and extends to the Mauhartsberg, the sides of which are covered with forests; on the north the eye wanders over a plain, the extent of which it cannot measure; the heights on the south are crowned with villages and country houses, surrounded by verdant woods. The lofty summits behind these heights, have from their distance a bluish tint, of which the different shades are insensibly lost in the azure of the sky.

Vienna, in German *Wien*, was founded in 1142 by Henry the First, duke of Austria; it is at present the largest city in Germany. It was so called from a small river which traverses it, and throws itself into the Danube.

^c "7 post leagues Fr."—about 17 Eng. miles, which corresponds with its extent in German geographical miles.—P.

^d Circumference of Paris, 17 miles. (Morse.) Circumference of the wall of Paris, 17 miles; of the compact part of the city, 14 miles. (Ed. Encyc.)—P.

The elevation of its surface is about four hundred and sixty feet above the level of the sea; its circumference, including the different suburbs, is not less than three and a half German, or twelve English miles.^c Thus, in superficial extent, it is nearly equal to Paris,^d although the two towns are very different in point of population, for Vienna does not contain more than two hundred and fifty thousand inhabitants. The town, properly so called, stands nearly in the centre of the ground which all the buildings occupy; it is encompassed with ditches and ramparts, and communicates by twelve gates with thirty-four suburbs, which are very extensive, but are partly occupied by cultivated fields and gardens. Encroachments however are every day making on the fields; indeed, more than six hundred new houses have been built in the suburbs since the year 1826. Vienna no longer resembles the town which the French have several times entered victorious; were those who had seen it ten years ago to return at present, they might be ready to suppose it a different place. It is long since the bastions and the ramparts have been adorned with fine walks, and since the *Burg-Bastey* and the *Bastey of Rothenthurm*^e have been embellished with excellent buildings;^f on the glacis, opposite the *Burg*, may be seen two gardens laid out with much taste, one of which belongs to the court, and the other to the public; in the last is a temple, in which has been placed an admirable statue of Theseus, the work of Canova.

The irregularity of the buildings in the interior of the city indicates its antiquity. None of its eighteen squares are very large; its hundred and ten streets, though narrow and crooked, are clean and well paved. The houses are large, high and substantially built; the mean number of inhabitants to each house exceeds forty persons, but some of them contain many more. One house, for example,^g is inhabited by four hundred tenants, and it yields a rent of sixty thousand florins, or nearly £7000. The ancient burgess hospital,^h now private property, is let to two hundred families at a rent of a hundred and twenty thousand florins. Most of the squares are adorned with fountains or other monuments. The Hof is the largest and most regular; it is decorated with bronze statues, cast by Fiseher. A colossal equestrian statue of the emperor Joseph the Second, also in bronze, decorates the square of Joseph. A fountain, adorned with leaden figures representing the four principal rivers in the archduchy, has been erected in the Neumarkt. But the Graben square, which is situated near the centre of the town, is more frequented than any other; in an enclosure, are observed two fountains and marble figures representing the trinity, perhaps the best work of Strudel. The principal shops are situated in that square and in the Kohlmarkt, a large and well built street that leads to it.

Among the principal edifices in Vienna, may be mentioned the Burg, an imperial palace, in which are several collections, consisting of minerals, objects of art, curiosities and medals; they are considered more valuable than most other collections of the same kind in Europe.ⁱ The emperor inhabits that part of the Burg which has been called

^e The Bastion of the palace and the Bastion of Rosenthurm.

^f "Coffee-houses."—See Russel's Tour in Germany, p. 377.

^g The Trattner House.

^h Bürger-Spital—converted into dwelling houses by Joseph II.

ⁱ Among the antiquities are a great many bronze figures, statues, and jewels of different kinds, five hundred Etruscan vases, four hundred ancient lamps, and thirty-two thousand gold and silver medals.

the Schweitzerhof. This palace, like the Tuileries, unworthy of a sovereign, is surrounded with many public buildings; on one side is situated the ancient imperial chancery, adorned with many statues, forming four groups of a colossal size; on the other, the imperial library, containing three hundred thousand volumes, six thousand specimens of early printing, and twelve thousand manuscripts^a at a greater distance are the riding-school, a very elegant building, two assembly rooms^b and the theatre of the palace. The other buildings that may be mentioned, are the palace of the duke of Saxe-Teschen, the mint, the chancery of the court, the war-office, the Bohemian and Hungarian chanceries, the townhouse, the palace of the archbishop, the bank, the custom-house, the university, the chamber of the states, and the two arsenals. In the town's arsenal in the Hof, is preserved the head of the grand vizier Kara Mustapha, who commanded the Turkish army at the blockade of Vienna in 1683, and was strangled at Belgrade in the following year. In the great arsenal are to be seen part of the dress worn by Gustavus Adolphus at the battle of Lutzen, and the balloon, which, in consequence of the observations made from it, enabled the French to gain the battle of Fleurus.

The number of houses, in the town and suburbs, is equal to seven thousand and fifty; besides which there are a hundred and twenty-three palaces, belonging to different nobles, twenty-nine catholic churches, one reformed, and one Lutheran church, two Greek churches, two synagogues and seventeen convents, fourteen of which are for men, and three for women.

The three principal churches are those of St. Peter and the Augustines, and the metropolitan church of St. Stephen; the first is built after the model of the famous one at Rome, and the cupola is covered with copper; the second was finished in the year 1330, and it contains the mausoleum of the grand dutchess Christina, a monument that cost 20,000 ducats, and in which it is easy to discover the genius and taste of Canova; the hearts of the deceased members of the imperial family are preserved in a chapel adjoining the same building. The church of St. Stephen, a fine Gothic edifice of the fourteenth century, is three hundred and forty feet in length, two hundred and twenty in breadth, and eighty in height. The tower rises about four hundred and thirty feet above the ground; it supports a bell, weighing more than eighteen tons,^c and made of the cannon taken from the Turks, after they had raised the siege of Vienna. The same building is adorned with thirty-eight marble altars; it contains the tombs of the emperor Frederick the Fourth and of several cardinals, and also those of prince Eugene and the celebrated Schpisshammer, a physician, poet, orator, historian and philosopher.

The town communicates by thirty-nine bridges with Leopoldstadt and the suburbs on the left bank of the Danube. Leopoldstadt, situated on an island, is exposed to the inundations of the river. A fine walk, in which are planted different rows of trees, that terminate in a grove, serves as a

place of meeting for more than thirty thousand persons on the anniversary of St. Bridget, the tutelar saint of the parish. The quarter of Jägerzeile on the same island, is inhabited by the higher classes; it is embellished by many fine palaces and a theatre, and most of all by the Prater, a magnificent walk, in which may be observed coffee-houses, various places of amusement, panoramas, riding-schools, and schools of natation. At no great distance from it, is situated the Belvedere, built by prince Eugene, but now the property of the emperor, and remarkable for its gallery of valuable paintings.^d The large military hospital^e and the chapel belonging to it, are situated near the entrance to the suburb of Landstrasse. The church of St. Charles, more regular than any other in Vienna, adorns the suburb of Wieden; it was built by the emperor Charles the Sixth, to fulfil a vow he had made, while the plague desolated the city in the year 1713. The suburbs of Vienna, although irregular, are finer than the town; they seem almost to be formed of palaces and gardens, but the streets, it must be admitted, are ill paved, as the stones used for the purpose are too small, and on that account are disagreeable to walkers.

It is unnecessary to enumerate all the places of public or private instruction in Vienna; it may be sufficient to mention the most important. Whatever has any connexion with the useful arts, the different kinds of industry, and commerce, is taught in the polytechnic school. The medical and surgical academy is remarkable for its organization and for the beauty of its edifice. Twelve hundred students attend the university, and the lectures are delivered by seventy-nine professors. The university library consists of a hundred thousand volumes; there are chairs of anatomy, chemistry, physics and the different branches of natural history. The oriental school was established in order to form interpreters, for the purpose of facilitating the relations between Austria and the Porte. Besides these schools, others have been instituted for the children of the nobility. The fine arts are taught in the imperial academy, and other seminaries are occupied with the application of these arts to different products of industry. To these may be added, the academy of engineers and the musical school,^f a normal school, a theological seminary, five colleges, and a protestant university that is ill attended, because the wealthier protestants prefer to educate their children at home; lastly, there are sixty schools for the lower orders, and most of them are conducted on an excellent plan; in the school of Neubaugasse, reading, writing, arithmetic and drawing are taught gratuitously; the girls are instructed in needlework, and kept separate from the boys; corporal punishment has been abolished. Other charity schools for the children of artisans are open on Sundays from nine to eleven o'clock in the forenoon. The daughters of the wealthier classes are educated in convents, but an imperial seminary has been founded for the daughters of officers. The principal schools have their collections or museums, by which the arts and sciences that are taught, are illustrated.

ninety-five of the Flemish school; and in the upper story, three hundred and fifty-one of the ancient and modern German schools. In one of the rooms is observed a fine Mosaic painting, representing the last supper by Leonardo da Vinci.

^e "Hôtel des Invalides" - *Invalidenhaus* (Germ.)

^f It is stated in the *Wiener-Zeit* (1825,) that a hundred and seventy-five pupils of both sexes attend the musical school. It contains a library consisting of historical and theoretical works relative to music, a great many manuscripts on the same subject, and a very extensive collection of ancient and modern musical instruments.

^a In the same library are eight hundred volumes of engravings, and two hundred and seventeen volumes of portraits. Among the manuscripts are several Mexican hieroglyphics, which some future Champollion may perhaps decipher; a manuscript of Dioscorides, with plants on vellum, painted in the fifth century; the original of the senatus consultum by which the Baccharalia were regulated, A.R. 567; and lastly, Tasso's manuscript of Jerusalem Delivered.

^b Ridottos.

^c "367 quintals."

^d In the right wing of the gallery, are three hundred and twenty-five pictures by the great Italian masters; in the left wing, a hundred and

The charitable institutions are not less numerous; the most important may be enumerated. The hospital or infirmary^a in the suburb of Alster,^b is remarkable for its large dimensions and the great cleanliness with which it is kept. It contains seven courts planted with trees, a hundred and eleven wards furnished with two thousand beds, and receives annually from fifteen to seventeen hundred patients. The foundling hospital, the imperial orphan hospital, and the deaf and dumb institution, are worthy of the capital.

Mendicants dare not appear in the streets of Vienna; a work-house has been built for all the beggars in the province, and another for vagrants, who are not accused of any crime; but the latter are not allowed, as in France, to have any communication with criminals.

There are in Vienna, as in every other great town, many places of amusement, many ways in which the idle may pass their time. Five theatres are open the greater part of the year, and in the fine season, the public walks and gardens are crowded. The number of coffee-houses amounts to seventy, and the taverns and ordinaries to three hundred.

The capital is more important as a manufacturing town than any other in the Austrian empire; more than sixty thousand individuals find employment in different branches of industry. The manufactures consist of silks and other stuffs,^c gold and silver lace, ribbons, hardware goods, needles, mathematical instruments and different kinds of paper.^d The carriages of Vienna are prized in most parts of Germany; there are besides several porcelain works, and one of them employs a hundred and fifty painters and fifteen hundred workmen. The cannon foundery and the manufactory of arms are supported by government. The average number of muskets that issue every year from the imperial manufactory, is said to be equal to thirty thousand. The other articles made in the same town are steel ornaments, jewellery, watches, excellent musical instruments, and different chemical products.

The capital is also the central point of Austrian commerce, and of the circulation required to maintain it. The produce of its industry which brings annually a revenue of two millions four hundred thousand florins, gives rise to an exportation sufficient to furnish cargoes to six thousand boats, and merchandise for nearly two millions of wagons.^e The canal of Neustadt finished in 1803, serves as a means of communication between the Danube and the metropolis; boats ascend by means of locks to the basin in front of the townhouse. Three fairs are held in the town, and the number of mercantile houses of every kind amounts to nearly a thousand.

Fortifications and walls are still kept up round the central part of the town, but Vienna is not a place that can offer much resistance in the event of a siege; the garrison does not exceed ten or twelve thousand men. Although important from its population, it has given birth to few distinguished men; but among them may be mentioned some that have acquired a name in German literature, such as Schroeckh, Collin, Alxinger, Mastalier and the historian Inchofer, known by his ecclesiastical annals of Hungary, and by a Latin work, published under a fictitious name,^f entitled *Monarchia Solipsorum*, a satire against the Jesuits, the translation of which was for some time popular in France.^g

The luxuries and delicacies of the table are carried to a greater excess at Vienna than at Paris, but they may be had at less expense in the Austrian than in the French capital. Nobles from every part of the empire settle there, and contribute by their wealth to increase its commerce and industry. The indolence and ennui of the rich render many places of amusement necessary, but none are so much frequented as the theatres. If the pieces acted on the stage, are not admired by the other Germans, the fault must be imputed to the dramatic censors appointed by government. Much has not been done in literature, still less in science; music forms the only exception: it has been cultivated with great success. There are few catholic towns, where the people are so punctilious in observing religious forms and ceremonies; no class of the community, no rank or order, are free from credulity, superstition and bigotry. But although the inhabitants are ignorant, they are not corrupt; the men are honest, and the domestic virtues are cherished in many families.

More liberty, and greater encouragement given to knowledge, by impressing a salutary impulse on the capital, might produce a great and beneficial change in the whole population of Austria. The vigilance of the police borders on oppression; some of them hold the office of dramatic censors, and they exercise it in a very capricious manner; indeed it seems to be full time that the office should be abolished, and the police reformed. The emperor said a few years ago, when returning from the theatre after a first representation, that he was well pleased at having seen the play, as he was convinced the censors would condemn it. The truth of the remark was afterwards confirmed.

The stranger observes, not without interest, the bastions that protected the town against the attacks of the Turks. But during the wars of Napoleon, Vienna was twice taken by the French. The example of so many other capitals that yielded to a victorious chief, may console the Austrians, if any confound success in battle with national honour. The same town was taken in 1241 by Frederick the Second, duke of Austria, and by the emperor Rudolph the First in 1277. It was vainly besieged by the Hungarians in 1477, but obliged to surrender eight years afterwards to Matthias, king of Hungary and Bohemia.

Vienna resisted the Ottoman troops in 1529 and 1683. The recollection of the last siege has been handed down to the present inhabitants. No event was ever more likely to have been fatal to Germany, and perhaps to Europe. Kara Mustapha, son-in-law and grand vizier of Mahomet the Fourth, excited by the ambition of subjecting the west to the humiliating yoke of his master, traversed Hungary and entered the plains of Austria with an army of more than two hundred thousand men, and a train of artillery consisting of three hundred cannon, a very formidable *materiel* at that period. Charles the Fifth, duke of Lorraine, compelled to give way to such an overwhelming force, retreated in haste to Vienna. Fear pervaded the inhabitants, and the emperor fled secretly and ingloriously from the capital. It is in such moments that kings feel the misfortune of not being beloved by their people. Leopold having suddenly taken the resolution of flying with his family, passed through the fugitive crowd that encumbered the road to Lintz. But he soon discovered that he was only one among a multitude of sufferers; he and his family were obliged to pass the

^g The translation was published in France, in the year 1792.

night in a wood, and the darkness was dispelled by the flames which preceded the Ottoman hordes, and with which Hungary had already been desolated. Terror was at its height in Vienna; all must have been lost but for one man, and that man was John Sobieski. Kara Mustapha had encompassed the town; the count of Starenberg burnt the suburbs, armed the students, and resisted with a feeble garrison of sixteen thousand men; but after twenty-three days siege, the garrison weakened, without provisions, obliged to fight and to extinguish the fires occasioned by bombs, were reduced to despair. The enemy had taken the counter-scarp, when Sobieski appeared with seventy-four thousand men; he examined the position of the vizier, gave the signal of battle, and the formidable army of Mustapha was cut to pieces. Never was so great an alarm followed by so brilliant a triumph; the booty was immense, Vienna was saved; and Christendom freed from the danger that menaced it, by the coolness and intrepidity of a hero.

The ancient town, called *Castra Fabiana* or *Faviana*, and afterwards *Vindobona*, rose into notice under the first emperors; the tenth Germanic legion was stationed there in the time of Ptolemy; Marcus Aurelius died in the same place; Gallienus gave it up to the Marcomanni after having married the daughter of their king; Aurelius united it again to the empire.^a While some alterations were making about two years ago in the botanical garden, several antiquities were discovered, such as coins, vases, bricks and other relics, from which it appears that the site of the garden was formerly within the enclosure Vindobona. When the chapel of the Capuchins was enlarged, a chapel that serves as a place of interment for the emperors, there were discovered much about the same time a Roman tomb, fragments of funeral vases, and other articles, which render it probable that the road from Vindobona to Rome passed near the present convent.

We have already mentioned the beauty of the neighbouring country; the castles and country houses on the heights are so numerous that it would be no easy matter to describe those only which belong to the imperial family. Schœnbrunn was built by Maria Theresa. It is remarkable for the extent of the buildings, the beauty of the gardens, and the profusion of rare and valuable plants in the conservatories. Laxenburg, a Gothic castle belonging to the emperor, is encompassed with ditches and other works that give it the appearance of a small fortress. The interior is decorated in the same style as the exterior, and contains many curiosities of the middle ages. It forms a singular contrast with its modern gardens, and even with the regularity of the burgh at the base of its walls.

The village of Maria-Hitzing near Schœnbrunn has been considered the finest and most picturesque in Austria. It possesses a theatre, and is visited on account of its baths. Penzing is known from its ribbon manufactories, and Medling from its mineral waters. Several country houses are situated near these villages.

We will now quit that part of the country where the houses of the wealthy rival each other in elegance, and where their grounds, laid out with great taste, give to the basin of Vienna the appearance of an immense garden. The towns now to be mentioned are situated in the plains of Lower Austria. Kloster-Neuburg, on the banks of the

Danube, deserves to be noticed, not on account of its population, which does not exceed three thousand two hundred inhabitants, but on account of a magnificent convent belonging to the Augustines. The town is decorated with a fine church, in which the ducal crown of Austria is deposited; it has besides a seminary, a valuable library containing more than four hundred manuscripts, and a collection of natural history and medals.

Baden, at some leagues to the south of the capital, is situated on the northern declivity of Mount Calvary;^b it is commanded on the east by verdant hills, while a fruitful plain extends to the west. The population does not exceed three thousand persons, but its baths, the efficacy of which in rheumatic affections has been acknowledged, are so much frequented, that more than five thousand strangers resort to them in some seasons. Walks have been made in the neighbourhood, and the parks and pleasure grounds of the different proprietors are open to strangers.

Neustadt or Wienerisch-Neustadt has been considered, after the capital, the finest town in the archduchy; the number of its inhabitants, according to M. Thielen, is equal to eight thousand three hundred.^c It is adorned with three large squares; the houses are well built, and the streets are straight and regular. It possesses several seminaries, and a military school attended by five hundred pupils. The canal, which has been already mentioned, passes from the town to Vienna, and serves to supply the latter with wood, coal and stones for building.

The summit of the Schneeberg is about five leagues to the west of Neustadt. That mountain is visited by a greater number of strangers than any other in Lower Austria. It is covered with mists nine months in the year, and none need ascend it, unless the weather be serene and cloudless. After having mounted a short distance on the most frequented road, the spectator observes below him, a narrow and deep valley, part of which is occupied by a lake. Having past the region of trees, he arrives at a sort of platform, on which a house has been built for the accommodation of travellers that may wish to remain during the night. Lichens are the only plants that grow above the inn; the remaining part of the journey is not without danger; it is necessary to climb naked rocks, and to avoid frightful precipices. The height of the summit is such as to command a most extensive horizon. The eye wanders over as fine a panorama as can well be imagined; the wooded heights of the Wiener-Wald and the Mannhartsberg appear on the north; Vienna seems like a village, and the Danube like a small stream in a verdant plain. It is not difficult to count all the towns, and although the distance is so great as to make them resemble so many points on a geographical map, there is no summit from which a stranger can at once form a more correct notion of the wealth and importance of the archduchy. The view towards the south is bounded by the chain of the Alps, extending more than a hundred and twenty miles in length;^d on the west are seen the mountains in Upper Austria, the Salzburg Alps and even those of Tyrol, while the vast Hungarian plain extends on the south-east to the neighbourhood of Raab and Ofen. Only those towns have been hitherto mentioned, which may be observed in ascending the canal of Neustadt; the description of Lower Austria may therefore be completed

^a See the excellent work of Baron Hormayer: *Wien, seine Geschichte und seine Denkwürdigkeiten.*

^d "60 leagues."

by giving an account of the towns that are seen from the Schneeberg.

Bruck, situated in a valley on the right of the Danube, and on the banks of the Leytha, may be mentioned on account of its custom-house, and a large square adorned by a fountain. Haimburg contains three thousand inhabitants, and carries on a greater trade in tobacco than any other town in Austria. Krems and Stein are seen towards the west, on the left bank of the Danube; the one is peopled by three thousand six hundred inhabitants, and the other by fifteen hundred. They are separated from each other by an alley of trees, and two rows of houses, which accounts for a popular saying: *Krems and Stein are three towns*. Krems carries on a considerable trade in proportion to the number of its inhabitants; they are employed in different branches of industry. But the commerce of Stein lasts only a part of the year, or while the river is favourable for navigation. A castle now in ruins rises above Durrenstein, in which Richard *Cœur de Lion* was unjustly confined. Mœlk, although only a burgh, is remarkable for a large convent, belonging to the Benedictines, and for its gymnasium, library and collections of natural history and antiquities. *Saint Pollen*, a place of four thousand inhabitants, and the chief town of a bishopric, is situated between the Danube and the Wiener-Wald in a fruitful plain covered with cultivated fields, gardens and rich meadows. Other places, though less important, may be briefly enumerated. The people of Awischofen are employed in making glass. Alosdorf carries on a trade in saffron, and Mistelbach in different kinds of grain; the latter is peopled by three thousand inhabitants. Aleiben is noted for its royal sheep-folds, which are said to be the largest in Austria. Maria-Taferl, a village built on a height, is no less celebrated for its religious processions; more than a hundred thousand pilgrims visit it every year. Riesenberg was the birth-place of the famous composer Haydn, and Wagram or Teusch-Wagram stands in the plain, where the French were victorious in 1809.

Lintz, the capital of Upper Austria, is so called from *Lentia*, its name in the time of the Romans; it contains a population of twenty thousand souls. The town is neither so populous nor so well built as the suburbs. The ornaments in the great square are not perhaps accordant with correct taste; a pillar erected by Charles the Fourth to the holy trinity rises in the centre, and on the right and left are two fountains, the one decorated with a figure of Neptune, and the other with a statue of Jupiter. The public buildings are nowise remarkable, but the town possesses different places of education, several charitable institutions and important manufactories. Although the mountains of Bohemia protect it from the north winds, Reaumur's thermometer descends frequently to fourteen or fifteen degrees below zero. The west winds which are very common, are disagreeable and unwholesome.

Steyer on the Ens, a town of nine thousand inhabitants, rises in a valley, watered by a small river of the same name. The Burg, an old castle belonging to the prince of Lamberg, is the only edifice worthy of notice, and its fountains are considered its greatest ornaments. The utmost activity prevails in it; almost all the inhabitants are engaged in

trade or in some department of industry. It is there that iron appears to be of greater utility than gold; many thousand hands convert the metal that is brought from the mines of Mount Erzberg into every variety of form. Numerous hammers are moved by the Ens, which serves likewise to transport the merchandise of the town. Steyer exports files to Germany, Switzerland, Italy and the Levant, razors for less than a florin the dozen to the East, penknives for fifteen or twenty florins the thousand to Moravia, Silesia and Galicia, and shoemakers' instruments^a to Germany, Switzerland and France. A great many jewsharps are sent to Steyer from forty manufactories in the neighbourhood of Mount Priel; these as well as many other articles are exported to different countries in Europe.

The town of Ens is situated near the confluence of that river with the Danube; it contains three thousand inhabitants, and if it be true that it formed only one town with Loreh, the ancient *Laureacum*, it must be considered one of the oldest towns in Austria. The principal ornament of the town is a tower in the great square, built by the emperor Maximilian I.

Gmunden on the lake of Traun, contains a population of three thousand souls; the town is pleasantly situated and neatly built, and the government offices of the mines^b are its finest buildings. The beauty of its position depends principally on the lake, which is nearly eight miles in length and more than one in breadth;^c its waters are of a dark green colour, but they become nearly black during stormy weather.

Garsten, a Benedictine chapter situated in the vicinity, was founded more than eight hundred years ago.^d The church is not less remarkable for its architecture than for its fine paintings and numerous ornaments; within its walls may still be seen the tomb of Ottocar the Fourth. But this chapter cannot be compared with that of Krems-Munster, founded in the year 777 by Tassilo, duke of Bavaria. The great size of the edifice, the fine observatory, the large library, and the valuable collections of natural history and philosophical instruments, are in unison with the magnificence of the interior, and the elegance of the gardens, and serve to render the monastery superior to any other in Germany. The neighbourhood is remarkable for its petrifying springs; they deposit on the plants around them a sediment of calcareous matter in such abundance that it is used in building.

The commerce of Hallstadt is confined to the produce of its salt mines, which yield every year about fifty thousand hundred weights.^e A lake, of which the depth has never been measured, is situated near its walls; it is equal in length to eight thousand four hundred yards, and in breadth to eleven hundred;^f its waters, which are of a dark green colour, abound with excellent fish. It has been supposed that Branau, which now contains three thousand inhabitants, stands on the site of the Roman *Bundunum*. The small town of Montzee^g is built on the banks of a lake nearly five miles long, two and a half broad, and at the centre four hundred yards in depth.^h The cataract of Bachsfall, falls from a rock four hundred feet in height, at no great distance from the village of Bischofshofen.

Salzburg, one of the finest towns in the archduchty,ⁱ is the only other place of which it is necessary to give some

^a "Shoemakers' awls."

ⁱ Salzburg forms no part of the archduchty of Austria as it existed before the French revolution. Its territory then formed a principality, subject to the archbishop of Salzburg.—In 1806 it was added to Austria, in

account. It has been called at different times, *Juvavium*,^a *Hadriana* and *Petena*. It was ruined by Attila in the year 448, and afterwards rebuilt by the Bavarian dukes, at the request of St. Rupert. The Salzach separates two regular and well built quarters, a rampart encompasses the town, and three suburbs extend beyond the entrance. It contains fourteen thousand inhabitants, but the population corresponds ill with the size of the town; deserted streets, and uniform houses, built in the Italian style, give it a gloomy aspect. The principal entrance, cut through a rock, is about a hundred and fifty feet in length, and from twenty to twenty-four in breadth. A marble statue of fifteen feet in height, representing Saint Sigismund, is placed before the entrance. A large fountain adorns one square,^b and another, that of the cathedral,^c is surrounded by arcades. The cathedral itself is built after the model of St. Peter's at Rome, and a much admired statue of the virgin stands on the principal front. Salzburg gave birth to the famous Paracel-

sus,^d and his ashes repose in the cemetery of Saint Sebastian. The remains of ancient Roman baths, from which many valuable antiquities have been collected, are situated near the hospital of St. John. Salzburg is the only fortress in Upper Austria; the climate is very variable, and on that account unwholesome.

The Austrians are sober, and faithful in their engagements, particularly in their duty to their sovereign. Like plants, they may be distinguished by the nature of the soil; at least the difference is apparent between the inhabitants of the wine and grain countries. The natives of the plains are strong and muscular, those in the mountains are light and active.

The importance of the revenue might be inferred from what has been said of the industry that prevails in the country. It amounts in Lower Austria to 26,000,000 florins, but in Upper Austria it does not exceed 8,000,000.

1807 transferred to Bavaria, and again restored to Austria in 1817." (Ed. Encyc.)—"The archbishopric was secularized in 1802, and given, with Eichstedt, Berchtolsgaden and a part of Passau, to Ferdinand, archduke of Austria and grand duke of Tuscany, as an indemnification for the loss of Tuscany. At the peace of Presburg (1806,) Salzburg was immediately annexed to Austria. At the peace of Vienna (1809,) it was surrendered to Napoleon, who ceded it to Bavaria (1810.) After the peace of Paris (1815,) Salzburg was restored to Austria, with the exception of a part of it

on the left bank of the Salza, which, together with Berchtolsgaden, was left to Bavaria. (Conv. Lex.)—P.

BOOK CXXVIII.

EUROPE.

Europe continued.—Germany.—Twelfth Section.—County of Tyrol, and Dutchy of Stiria.

Snow covered mountains and arid rocks are the first objects that the traveller observes on entering Tyrol and Stiria. The narrow and sinuous vallies in Tyrol unite with the wildness of a natural, the riches of a cultivated country; in Stiria the vallies are much larger, particularly in the south and the east; in both the climate is extremely variable.

Tyrol derives its name from an ancient castle near Meran, on a mountain that commands the Adige. The country passed by inheritance to the dukes of Austria in the year 1363. It is bounded on the north by Bavaria, on the west by Switzerland, and on the south and the east by the Lombardo-Venician kingdom, Illyria and Upper Austria. According to Blumenbach, its surface is equal to five hundred and twenty German, or six thousand two hundred and forty English square miles.^a

The two declivities of the Rætian Alps, which form the continuation of those in Switzerland, make up the greater part of Tyrol. To have a notion of the country, one must imagine mountains apparently almost as high as Mont Blanc, which none have ever attempted to ascend, frightful precipices, lofty cataracts, glaciers of several leagues in extent, and torrents rolling through rocky vallies; on one side, the icy winds of the north, and on the other, the sultry blast of the sirocco.

If the traveller be placed near the sources of the Inn, he may observe on the right,^b a chain less extensive than the others, which bears the name of Arlberg,^c or the Eagle mountain; hence the north-western part of the province has been denominated the Vorarlberg, or the country in front of the Eagle mountain. Another and higher chain extends from west to east, and forms what the ancients called the Rætian Alps,^d a name derived from the Roman province of Rætia. The continuation of the chain in the same direction was styled the Noric Alps,^e because the country on both sides made up the Roman Noricum; they terminate on the confines of Stiria and Austria. A chain that extends from the sources of the Mur to the extremities of Stiria, has received the name of the Stirian Alps.

Tschernowand is next to Orteles, the highest summit in the Rætian Alps.^f The most extensive glaciers are the Gebatsch and the Rofner. The rivers that rise from the

Arlberg, are the Isar, the Lech, the Iller and the Inn. The Etsch or the Adige which throws itself into the Adriatic Gulf, and the Drave which unites with the Danube, after having traversed Illyria and part of Hungary, take their rise from the glaciers in the great chain.

Many primitive rocks^g are situated both on the southern declivity of the Rætian Alps, and in the valley of the Adige. A distinguished geologist^h has made many important observations on the singular arrangement of the calcareous rocks, which consist of that variety of magnesian limestone, called *dolomite*. Nothing indeed can be more surprising than the inaccessible heights and bold forms that these rocks exhibit near the valley of Fassa; they appear to surpass what the imagination can conceive. Von Buch concludes that this white, granular and almost friable limestone had been compact, coloured, stratified and filled with organic bodies, before the augitic porphyryⁱ which supports it had by penetrating it with magnesia, destroyed the organic remains and changed its characters. The porphyry has been elevated by such a force, and to such an altitude, as to have raised into the air the colossal masses that surmount it. It is unnecessary to enter farther into the views of so great a geologist as Von Buch, but it may be added that they appear to be very probable, for the pyroxene which characterizes the porphyry, seems to connect it with igneous products. Von Buch however goes farther, for he supposes that all chains of mountains whatever have been formed by similar elevations from beneath; that opinion may be afterwards confirmed by other phenomena. Our limits prevent us from examining more minutely the geological formation of the Rætian Alps. Their elevation, and the account already given of the country round Salzburg which forms a part of the chain, are sufficient to prove that all the rocks which are considered primitive, are contained in them.

According to a professor, whom we have had already occasion to quote,^k coal is found in the mountains of Stiria, but the deposits in the valley of the Mur, which might be worked with profit, appear to consist of lignite rather than coal. They lie in the midst of sandstone, argil and shell marle, and these substances are encompassed and supported by the transition mountains in the country. This large valley is filled with deposits of tertiary formation.

The vegetable riches of the Tyrolese mountains are well known to botanists; they find on them many leguminous,

^a "1446 sq. Fr. leagues."—11,000 Eng. sq. miles (Morse.) The latter coincides nearly with the extent in the original, reckoning the German miles and French leagues as geographical, on which supposition alone they can be made to correspond.—P.

cruciform, labiate and composite plants, as well as *Orchidea*, *Cytisi*, *Genista*, *Euphorbia* and *Loti*. The air is embalmed during the night, by the fragrance diffused by the *Silene nutans*. But the most interesting plants are not found on the highest parts of these Alpine chains. The steep rocks of the *Lantsch* near Grätz, at the extremity of the calcareous mountains in Stiria, afford shelter to plants, which appear to be forever removed from the reach of the botanist. The woods that cover its summits are the only places where the *Delphinium intermedium* grows; it reaches to the height of five feet, and charms the eye with its fine blue flowers. The only examples of the *Peltaria alliacea* that flourish in a wild state are found on the sides of the same mountain.

Ferruginous waters have been discovered in different parts of Tyrol, but no warm mineral springs.

The oxen, cows and horses are small, but of a good kind; goats are more numerous than sheep, and different kinds of game are very common. Wolves, wild boars and bears haunt the forests, the clefts in the rocks afford shelter to marmots, and the chamois finds refuge on the highest summits, or in places which the hunter cannot approach.

The Rheti were the earliest people that are known to have inhabited Tyrol. They were composed of different tribes, such as the *Vennonii* or *Vennonnes*, whom Ptolemy and Strabo mention,^a and the *Brixantes*, whose chief town was probably built on the site of Brixen. Pliny informs us that they emigrated from Etruria; but it may be concluded that they were obliged to leave that country, as it is very improbable that a nation would renounce voluntarily so fine a climate as that of Italy, to settle in such a country as Tyrol. The Rheti were subdued by the Romans in the time of Augustus, and their territory received the name of *Rhetia Prima*, while that of the Vindelici was called *Rhetia Secunda*.

Different metals are found in Tyrol, but not in such quantities as to be of much value. Thus the gold collected annually does not exceed a hundred marks; silver is also scarce, and what is obtained is almost entirely extracted from lead. The copper is supposed to be more malleable, and, consequently, purer than in most other countries; but iron is more common than any of the other metals. The other substances that may be mentioned are cobalt, zinc, arsenic, sulphur and salt. The salt mines are the continuation of those in Salzburg, and one of them near Hall yields every year twenty-five thousand quintals. Although the revenue which government derives from the mines may be inconsiderable, the people contrive to gain a subsistence by them.

Agriculture has been brought to a great degree of perfection; the Tyrolese use their lands to the best advantage. Much labour and care are bestowed on the soil; vegetable mould is transported to high summits; the grass which grows on the sides of steep declivities, is collected for the cattle; even the atmospheric action by which rocks are decomposed, is rendered profitable to the husbandmen, who convert these remains into cultivated fields. The stranger observes not without amazement the Tyrolese peasant with a basket on his head, descending inaccessible rocks, by means of a rope and a stick, to the bottom of a precipice, in order that he may gain a few feet of land, and devote it to agriculture.

The hills favourable to the vine are covered with vineyards; it is true that the wine which they produce does not keep a long time, but although it may on that account be unfit for exportation, it forms the materials of an inland commerce. The vineyards are most numerous in the valley of the Adige; they cover the heights in the neighbourhood of Brixen and Tramin; those near the latter town are considered the most valuable. The Tyrolese also cultivate fruit trees, but the forests are much more important; they export timber for building to Venice.

But although the people be as industrious as possible, the country cannot furnish the means of subsistence to seven hundred and sixty-two thousand inhabitants.^b The people must find employment elsewhere; they must have recourse to other pursuits besides agriculture. Some have no other wealth than their cattle, but it could hardly be imagined that the birds which have been transported from the Canaries to Europe, where they are prized both for their notes and their plumage, form by no means an insignificant branch of trade in Tyrol. The people are compelled to gain a livelihood in any way, and they do not disdain to wander in foreign countries and to earn a subsistence by selling canaries. There are few manufactories in Tyrol, but almost every Tyrolian is an artisan or manufacturer. Many for want of a better employment travel as pedlars through the most distant countries, and return in old age with enough to enable them to pass the rest of their days in their native land. At six years of age the Tyrolian quits his mountains, sets out for the fair of Kempten in Bavaria, and renders himself useful by herding geese or cattle; at a later period he emigrates as a mason, carpenter, miner or picture-seller; it is reckoned that in this manner, more than thirty thousand individuals leave their country every year. Some preferring a hunter's life, traverse their mountains, endure all sorts of fatigue, and expose themselves to the greatest dangers to attain their prey; others wander in quest of medicinal plants, which they learn from their infancy, and know as correctly as the ablest botanists.

Among those who remain at home, some execute different works in wood with great skill; the vast forests in the Vorarlberg supply them with the materials for making wooden shops, and even houses, of which the different pieces are numbered, and transported to the lake of Constance, and from thence to neighbouring countries. It seems as if the Tyrolese were naturally mechanics; ingenious machinery, such as may supply the want of hands, is moved by the streams that water their vallies; wheels fashioned for that purpose, are set in motion at different distances. Do they require flour, or stand in need of oil? as every individual provides in a manner for his own wants, there are neither millers nor oil mills, but at the neighbouring stream, the corn is ground, and the oleaginous plants are pressed. A German traveller declares that he has seen a child rocked in his cradle by means of a wheel made to revolve by a stream.^c While men are engaged in different branches of labour, the women are not idle; some knit stockings, while others make goat skin gloves, embroider muslin, or plait straw which is manufactured into hats. But manufacturing industry is confined to the making of only a few articles; thus velvet is made in some places, and carpets in others,

^a Strabo, Lib. IV.

^b Such is the number of inhabitants according to the calculation of M. Thielen. See his *Manual*, Vienna, 1827.

^c M. Rohrer. See also "Voyage dans le Tyrol, aux salines de Salzbourg, &c. par M. de Bray."

particularly in the valley of Lientz. The transit trade between Germany and Italy forms a more important and extensive branch of commerce.

Frankness, fidelity, loyalty and love of country are the virtues that distinguish the Tyrolese. Averse to the conscription, because friendly to independence and liberty, none fight with greater bravery in defence of their country. Not corrupted by the usages of large towns, faithful in their domestic relations, peace and gaiety reign in their families. Devout, but also superstitious, they must have a religion that attracts by its ceremonies, that speaks to the imagination as well as to the heart; they people the summits of the mountains, and the gloomy forests which encompass them, with spirits, demons and sorcerers. Such being the case, it is not wonderful that there are no protestants in Tyrol; all the inhabitants, with the exception of eight or ten Jewish families, are catholics.

The Tyrolese enjoy more political liberty than the people in any other Austrian province. Government ratified their ancient privileges in 1816, and granted them a constitution better adapted to their wants. While the people in the other countries, subject to Austria, are represented by the clergy, nobility and deputies from a few towns, the Tyrolian states are not only composed of members belonging to these orders, but also of others elected by the peasantry. The people in the Vorarlberg possess certain prerogatives, in which the rest of the inhabitants do not participate.

The conscription has been abolished in Tyrol, but government has found that measure an additional security against a foreign invasion, for every Tyrolian becomes a soldier in time of war. The people are hardy, active and accustomed to fatigue; few armies can have much chance of resisting them, when they rise simultaneously to defend their country. They furnish to the government that protects them, only four battalions of light armed troops.^a Although no custom-houses are erected on the frontiers, the revenue is considerable; it amounts to more than two millions five hundred thousand Austrian florins.

There are in the country of Tyrol, twenty-two towns, thirty-six burghs, and three thousand one hundred and fifty villages. Some of the villages are as populous as the towns, but then the greater number of the latter are small and insignificant. Bregenz, situated in the Vorarlberg, on the banks of the lake of Constance, contains three thousand five hundred inhabitants. It is a place of great antiquity; the remains of Roman buildings are still seen near its ancient castle. The village of Achenrein derives its wealth from its founderies and iron works; the sheet copper and tinned iron that are sent from these works, yield a clear profit of sixty-five thousand florins. Imst, a burgh of three thousand inhabitants, on the banks of the Inn, exports canaries to the remotest countries in Europe; the trade is said to produce annually more than £4800.^b Scharnitz, on the frontiers of Bavaria, is the ancient Roman town of *Porta Claudia*.^c

Innsbruck or rather Innsbruck, which signifies the bridge over the Inn, stands in the middle of a valley, formed by mountains from six to eight thousand feet in height, and covered with snow even in the months of May and June. It is the capital of Tyrol, and its population consists of 10,500 souls. Although the town be small and ill built,

^a "Chasseurs," *Jägers*.

^b "90,000 francs"

^c The Roman *Scarantia*. Schärnitz is a fortified place on the frontiers of Bavaria, the fortifications of which were begun by the archduchess

the suburbs consist of modern houses, the residences of the nobles and the wealthy. The palace situated in a square adorned with a bronze equestrian statue of Leopold the Fifth, the court church containing the tombs of twenty-eight distinguished personages, and a monument to the memory of the emperor Maximilian, and lastly, the large and spacious town-house, are the only public buildings that can be mentioned in the capital. The celebrated globe of Peter Anich, a Tyrolese shepherd, who became an eminent geographer, is preserved in the hall of the university.

Hall, which lies below Innsbruck, is the chief town in the district of the salt mines; it contains four thousand two hundred inhabitants; its extensive salt mines are five thousand feet above the level of the sea. Schwatz, one of the largest burghs in the province, is peopled by seven thousand four hundred and fifty inhabitants, two thousand of whom find employment in the mines within its territory, which produce a great quantity of iron, two thousand five hundred quintals of copper, and three thousand five hundred marks of silver. Zierl, another village on the Inn, is commanded by steep heights and rugged rocks, from which the emperor Maximilian the First made a narrow escape. The prince, ardent in the chase, advanced so far that he must have perished, had it not been for the coolness and intrepidity of an attendant. The people tell the story, and show the place where a cross forty feet in height, has been erected to commemorate the event; but superstitious, and fond of the miraculous, they believe that the emperor was saved by an angel.

Sterzing, a town of two thousand inhabitants, was called *Urbs Stiraciorum* by the Romans;^d it carries on a considerable trade in iron and wines. Botzen on the Rienz, appears rather like an Italian than a German town; the valley in which it stands, is covered with vineyards and fruit trees, adorned with country houses, and bounded by lofty mountains that rise in the form of an amphitheatre. But the interior of the town does not correspond with its appearance at a distance, for the streets are dirty, crooked and narrow. The population amounts to seven thousand individuals.

Although the inhabitants give the name of fortifications to walls ten feet in height, *Trent*, or as it is called in Germany, *Trient*, could hardly resist an attack in time of war. Broad and regular streets, well built houses, fine paintings in the churches, numerous convents and hospitals, and a celebrated university, render it like an Italian town; indeed the illusion would be complete, if its fifteen thousand inhabitants spoke the Italian language. Trent is well known on account of its council, which lasted from the year 1545 to 1563. The mountains that rise on both banks of the Adige, are not the lowest in the Alps. The climate is excessively warm in summer, and intensely cold in winter.

Roveredo, situated in the pleasant valley of Lagarina, carries on a considerable trade in fruits and silk. The town, originally small and ill built, has been improved as the population has increased; it contains at present not less than twelve thousand inhabitants. Pieve, Castello and Cinte are villages of which the trade consists in pictures. Brentonico exports the greenish talc used by painters, and known by the name of *terra di Verona*.

The duchy of *Stiria* is bounded by the kingdom of

Claudia Medicea, whence is derived its modern Latin name of *Porta Claudia*. (Busching.)—P.

^d R. Von Jenny, *Handbuch für reisende in dem Oesterreichischen Kaiserstaate*.

Illyria, the archduchy of Austria, and the kingdom of Hungary. It is equal in superficial extent to three hundred and ninety-nine German, or four thousand seven hundred and eighty-eight English square miles.^a Several important chains are situated in that mountainous region; on the north are the Noric Alps, on the east the Stirian Alps, and on the west a branch of the Julian Alps. The highest mountains are those in the north, and the lowest are those in the opposite direction or the south; so that the country is thus divided into Upper and Lower Stiria.^b The principal rivers are the Ens, the Mur and the Drave. The basin of the Mur is larger than any other; that river receives more than a hundred feeders; it turns ninety-eight flour mills, forty-three saw mills and sixty fulling mills. Its declivity is so great as to give it almost the rapidity of a torrent; for the same reason it is never encumbered with ice; the oldest inhabitants do not recollect to have seen it frozen. Fish abound in all the rivers, but particularly in the Mur; although carp are not so common, trout, umber, pike and barbel are taken in great numbers.^c The lakes are numerous, but none of them are very large. What has been already said concerning the geological structure of the principal chains, renders it unnecessary to recur to the subject; but some account may be given of the ancient and present inhabitants of the country.

The Romans comprehended under the name of *Noricum*, a great part of Stiria. The *Norici* were governed by a king, when their country became a Roman province in the time of Augustus. According to Ptolemy, *Noricum* was inhabited by several tribes. The *Ambisontii* possessed the country on the west and the north; the *Ambidrani*, the *Ambilici* and principally the *Norici* were settled in the east and the south. In the latter part of the fourth century, the hordes of Alaric made themselves masters of the country, and their chief wished to erect there the seat of his empire; but he pursued the course of his conquests, and the Suevo, Heruli and Huns succeeded him in Stiria. It was for a long time subject to Bavaria, but the emperor Conrad the Second made it a margraviate in the year 1030. Erected into a duchy by Frederick the First, it passed in 1186 by right of succession to the house of Austria. Separated from the archduchy of Austria, it was again united with it in 1232; lastly, it was conquered by Ottocar the Second, king of Bohemia, but Rudolph of Hapsburg having been raised to the imperial throne, took possession of it, and it has since continued an Austrian province.^d

The country, it has been seen, was the theatre of frequent wars during the middle ages; but it is still easy to distinguish two different races of inhabitants, the Germans and the Wends, the last of whom are sprung from the Slavonians. The Germans form a population of six hundred thousand individuals, and the Wends of about two hundred thousand. The latter reside chiefly in the circles of Cilly and Marburg; they differ in their language and character from the other inhabitants. The German Stirians, or the natives of Upper Stiria, are strong and well made, honest, frank and industrious. The Wendish Stirians, or the natives of Lower Stiria, are weak in body, frivolous,

dissipated and superstitious.^e The greater part of the population adheres to the catholic religion; the number of protestants amounts hardly to three thousand. As to the Jews, they are not permitted to reside in the duchy.

The air is keen and often very cold in the mountains of Upper Stiria; but the temperature in the vallies is warmer than in most others in the Alps. The mean temperature at Grätz is from seven to eight degrees of Reaumur, and the height of the barometer about twenty-seven inches. The climate of Lower Stiria is so mild that the grape arrives at maturity; the wines may be drunk soon after they are made; most of them are of a good quality, and some not inferior in strength to the Rhenish wines.

The grain harvests are not abundant, but the flax is remarkable for its length and fineness. Vegetables, fruits, and leguminous plants flourish, and the forests are so extensive that their surface is supposed to be equal to half of the whole country. The lands are fruitful and well cultivated in the vallies; the cattle in the mountains are of a good kind, indeed they are considered the best in the Austrian empire; in every district the sheepfolds are numerous, and the country people rear besides a great quantity of poultry. The sportsman finds the red partridge, the hazel grouse and many other kinds of game in abundance, and flocks of chamois are met with on the mountains. If the herds and flocks have diminished within the last twenty years, it must be attributed to disastrous wars, and additional taxes—the necessary consequence of those wars.

The riches of the country consist principally in its mines, the Romans were supplied from Stiria with excellent iron, and that metal is still obtained in such abundance that it may be considered inexhaustible. The Stirian steel is better than any other in Europe. Silver, copper and lead, coal and rock salt, are obtained in different parts of the country, and it is to the metals obtained from the mines that the industry of the inhabitants is principally directed. There are more than thirty-six scythe manufactories in Stiria, and its exports are diffused over Austria, Hungary, and even the Ottoman empire; they may be estimated at one million eight hundred thousand florins.

Stiria is divided into five circles, of which the chief towns are Grätz, Bruck, Judenburg, Marburg and Cilly. It is governed like most other provinces under the Austrian empire. The members of the states consist of three classes, namely, the higher nobles, among whom are included the bishops, the petty nobles, and the deputies of the towns and burghs entitled to be represented in the assemblies. The country furnishes several regiments^f of infantry and a certain number of men for the cavalry.

Commencing with the mountainous region that occupies the northern extremity of Stiria, the stranger may form some idea of the wealth and population of the duchy by surveying the principal towns and inhabited places as he proceeds towards the south. The burgh of Aussec is situated near a lake, and at the junction of three small rivers which form the Traun. The produce of several salt works in its neighbourhood, exceeds a hundred and sixty thousand quintals. Not far from the village of Mirnitz is situated a cave, wor-

any of notice from its extent, its sinuosities and its stalactites, and from its fossil bones formerly held in veneration by the peasantry. Eisenerz, a burgh of which the church was founded by Rudolph of Hapsburg, is surrounded by mines from which more than two hundred and sixty thousand quintals of iron are obtained every year.

Zell or Maria Zell towards the north-east, and on the frontier of Stíria, has been termed the Loretto of the country; it is certainly more frequented by pilgrims than any other place in the Austrian empire. The church is one of the finest, and without doubt the largest in Stíria. The organ is not considered inferior to any other in Germany, the large pulpit is formed of red marble, and the chapel has been enriched by the offerings of pilgrims; the adored image of the virgin is placed on a silver altar, and the gate that leads from the church to the chapel is made of the same metal. The gold, silver, and other valuable articles deposited in the treasury, attest the pious offerings of the hundred thousand pilgrims that repair every year to the shrine of the virgin.

Bruck on the Mur is the metropolis of a circle, and the inhabitants are employed in working slate quarries and productive mines in its neighbourhood. The Capuchins have a convent in its vicinity. On the same river, and above Bruck, is situated Leoben, one of the best built towns in Upper Stíria. The preliminaries of peace between France and Austria were signed within its walls in 1797. Judenburg situated above Leoben, although the chief town of a circle, contains only fifteen hundred inhabitants. It was a place of some consequence in the time of the Romans; during the twelfth and thirteenth centuries, it was principally inhabited by Jews, whence the origin of its present name. As a great trade was then in the hands of these Jews, their prosperity drew upon them the hatred and persecution of the Christians, who succeeded in expelling or extirpating them about the year 1312. The town was almost wholly consumed by fire in 1807, and the inhabitants had much difficulty in repairing their losses; the Franciscan convent has been converted into an inn, and the ducal castle into barracks. Rohitsch appears to have been once a Roman town; at all events many coins, vases and other articles of antiquity have been found in it. Strangers frequent it on account of its mineral waters, and it exports annually more than eight hundred thousand bottles to Poland, Hungary and Italy.

Grätz or Gratz, the metropolis of a circle, and the capital of the province, is situated in the fine valley of the Mur. Its population amounts to forty thousand inhabitants; the greater number of them reside in the suburbs. According to a German traveller, Herren street is the broadest, Sporr street the most inconvenient, Schmidt street the most noisy, and Mur street the most crowded.^a The public buildings are the cathedral, the theatre, the town-house, recently erected, and the government-house in which the states meet. Grätz contains ten parish churches and twelve chapels of ease, together with five convents for men and two for women. Several hospitals may be mentioned among the charitable institutions, namely, the large hospital for sick, another for women in labour, a third for the insane, and a fourth for orphans.^b An university,^c a drawing academy,

a commercial seminary, gymnasiums for boys, and boarding schools for girls, are the principal places of education. A library containing a hundred thousand volumes and three thousand five hundred manuscripts, and the *Johanneum*, an institution so called from the name of the prince its founder,^d to which belong a botanical garden, a museum of natural history, and a cabinet of medals and antiquities, are considered the most valuable scientific collections. A Calvary, a church and several chapels are situated on a height in the neighbourhood. The town is a place of considerable importance from its commerce and manufactures.

Radkersburg,^e which might be surnamed the romantic, stands on an island in the middle of the Mur. The fortifications are in bad repair, and insufficient to protect it against the frequent inundations of the river. The village of Riegersburg is built on an eminence at no great distance from the last town. Its ancient castle is remarkable for its picturesque situation, for its fortifications cut in the rock, its deep ditches and the relics of the middle ages that are contained in it. It has been of late rendered illustrious by a man of genius^f who has paid a tribute of affection to its ancient proprietors.

The burgh of Leibnitz, on the right bank of the Mur, was perhaps the ancient *Mureola*, a town mentioned by Ptolemy; at least the opinion is rendered probable by the numerous antiquities that have been found at different times, and by the sculptures and Roman inscriptions that may still be seen in the tower of Schauberg which was built in the twelfth century.

Marburg, at the confluence of the Drave and the Mur, contains five thousand inhabitants. Although the metropolis of a circle, it possesses no public building of any consequence; it carries on, however, a considerable trade in corn and wine. The small town of Pettau is situated on the left bank of the Drave; the population does not exceed seventeen hundred inhabitants, but it has its convents of Dominicans, Minorites and Capuchins. It is considered the most ancient town in Stíria; many suppose it to have been built before the country was conquered by the Romans; there is, however, reason to believe that it was then situated on the other bank of the river.

Luttenberg to the east of Pettau, is famous for its wines. The town of Cilly is adorned with a castle in which many valuable antiquities are preserved. It was founded by the emperor Claudius, who gave it the name of *Claudia*,^g and its present walls are partly built with the remains of ancient buildings; the barracks which have been lately erected, form the finest edifice in the place. According to the legends, Maximilian, the first bishop of Cilly, was decapitated in the town in the year 284. A third Tœplitz, which is also known for its mineral waters, is situated at the foot of the mountains on the south of Cilly. Rain, a small town encompassed with walls now in ruins, lies near the southern extremity of the province, on the banks of the Save. The lands in the neighbourhood are fruitful, and wine forms the principal branch of its commerce. The rapid waters of the Save are covered with empty casks at the approach of autumn; they are bound together in rafts and steered by mariners who descend to the town and sell them to the inhabitants during the vintage. It is supposed that Rain was the

Novidunum of the Romans; it was pillaged and destroyed by the Turks^a after a sanguinary battle in the year 1475.

The district of Voitzberg, situated to the west of Grätz on the left bank of the Mur, is surrounded by mountains which separate it from Upper Stiria and Illyria. The highest part of the country is exposed for seven months in the year to the rigours of winter, and also to frequent and violent storms. But the vallies in the lower part of the country abound in fruits and wine. The inhabitants export coal, whetstones that are much prized in Stiria, and draught

horses of a good kind. The people are industrious; they are employed in their iron works, nail manufactories, paper mills and tile works; many of them, however, are subject to goitres. The small town of Voitzberg, three burghs and twenty villages^b are contained in the district.

The number of women throughout Stiria exceeds that of the men by nearly twenty-six thousand;^c the latter are supposed to be equal to three hundred and seventy-four thousand. Five is considered the average number of members in each family, and all the families, it has been calculated, amount to 160,500.^d

BOOK CXXIX.

EUROPE

Europe Continued.—Germany.—Thirteenth Section.—Kingdom of Illyria described.—Austria and Germany concluded.

THE name of Illyria is connected with historical recollections; it was one of the most ancient kingdoms in Europe, but it lost that title when it was conquered by Anicius, a Roman general, a hundred and sixty-eight years before the vulgar era. It retained however the name of *Illyrieum*, and under the reign of Augustus, Liburnia and Dalmatia, the fruits of new conquests, were added to it. Pliny informs us^a that the *Peucetiae* and the *Japydes* inhabited the region between Istria and Liburnia; we may add that the *Carni* possessed the country on the south of the Carnic Alps. It is supposed that these people were of Celtic origin. Mentelle affirms that *Carnia*, the present Carniola, derives its name from the word *karn*, which signifies rye.^b If however the name of the country be derived from a Germanic word, it must be from *korn*, which, as every one knows, signifies wheat, rye and all kinds of grain. Could it be proved that the country owes its name to the abundance of its harvests, it must have been originally called *Kornia*; the conjecture is indeed strengthened by the existence of a Roman medal, struck to commemorate the victories of Scaurus over the Carni, on the reverse of which are seen a Mercury and a cornucopia filled with ears of corn.

Illyria was so much enlarged by the addition of different provinces, that at the partition of the Roman empire, between Honorius and Arcadius, it was divided into two parts, of which one belonged to the eastern, and the other to the western empire.^c But the name of Illyria was no longer used after the northern hordes invaded that portion of Europe; it was comparatively of late years that the Austrian chancery restored the name to distinguish part of the ancient *Illyrieum* from the Hungarian provinces and those that extend to the south of the Drave. After the peace of Presburg, Napoleon, who compelled Austria to cede Kraiburg, Friuli, Istria, Croatia on the south of the Save, and a part of Dalmatia and Tyrol, incorporated them under the name of Illyria with his vast empire.^d Austria having gained anew her possessions in 1814, united Carniola and Carinthia, the territory of Trieste, and a part of Croatia, Austrian Friuli and Venetian Istria, and thus restored the kingdom of Illy-

ria. It was at the same time divided into two governments, those of Laybach and Trieste.

It is bounded on the north and the east by the archduchy of Austria, the duchy of Stiria and Croatia, on the south by the generalship of Carlstadt^e and the Adriatic Gulf, and on the west by the Lombardo-Venetian kingdom and the county of Tyrol. According to Blumenbach, it is equal in superficial extent to six hundred and eighteen German, or seven thousand four hundred and sixteen English miles.^f

Lofty chains of mountains extend across the country in different directions; the coasts are marshy on the east, in other places they are flat and sandy. The peninsula of Istria, terminating on the south in Cape *Promontory*,^g forms the southern portion of the government of Trieste. The vallies in the districts of Villach and Klagenfurt are sufficiently fertile; the soil is covered with calcareous fragments. The lands in the circles of Laybach, Neustadt and Adelsberg, in some places abounding with rocks, in others covered with marshes, sandstone and sand, are sterile and unfruitful. The western portion of the kingdom is bathed by the Adriatic; there the dryness of the soil, which rests on calcareous rocks, and the scarcity of water, do not appear to be hurtful to vegetation. It may be remarked that the plants in the southern districts have a great resemblance to those on the shores of the Black Sea.

The branches of two lofty chains extend into Illyria, namely, the Noric Alps on the north, and the Julian Alps on the south. They are in a great measure, particularly the last, composed of calcareous rocks which geologists call secondary, and which, from their tendency to disaggregation in particular parts, so as to form numerous cavities, might well be termed cavernous limestone. It seems indeed as if all these mountains were hollow; at least it cannot be denied that almost as many rivers flow below as above the ground. The stranger who follows their course, observes them entering the earth and returning from it at different distances. Others become wholly dry at certain seasons of the year, and afterwards reappear.

It might be possible to enumerate more than a thousand caverns in the chain that traverses Illyria from north-west to south-east; but none can be compared in point of extent with the one at Adelsberg, which is situated in a small val-

^d Austria lost by the peace of Presburg (1805,) Dalmatia, Istria, Friuli and Cattaro on the Adriatic, together with Tyrol and the Swabian Principalities. By the peace of Vienna (1809,) she lost Trieste, Fiume, the

greater part of Croatia and Carniola, and the circle of Villach in Carinthia, besides other possessions not connected with the present subject. The circle of Villach, Carniola, Austrian Istria, Fiume and Trieste, Croatia including the *Litorale*, and Dalmatia, were denominated the Illyrian Provinces by a decree of Napoleon (1809.) Kraiburg is only a small town in Carniola (Germ. *Krain*.) Ed. Encyc. Conv. Lex.—P.

^f "1718 sq. Fr. leagues,"—13,508 Eng. sq. miles. (Mose.)

^g Ital. *Punta Promontorio*.

ley at no great distance from that burgh. Some writers consider it equal in length to five miles.^a It is by no means easy to trace the rapid declivities in the labyrinth, or the narrow and tortuous passages which lead to immense halls. All agree that it surpasses most places of the kind; the floor is covered with fossil bones; a torrent rushes through the cavities with a frightful noise, which is repeated by many echoes; stalactites adorn the halls, and appear in some places like the ruins of old palaces, in others like magnificent colonnades.^b

The cave of Magdalena, although not nearly so extensive as the last, is fully as deep, and more remarkable on account of its stalactites. The vault has the appearance of being supported by colossal cariatides, and the different calcareous concretions exhibit the most varied forms. That species of water lizard^c known by the name of *Proteus anguinus* abounds in a small basin at the extremity of the cave.

Many lakes, and all of them amply stored with fish, are situated in the Illyrian mountains; but the lake of Cirknitz has been more frequently examined by naturalists than any other; in some years, the angler, the field sportsman, the sower and the reaper may there find employment. Calcareous mountains bound it on every side; mount Jovorniek commands it on the south, and the Sliviza on the north. It is about four or five leagues in circumference in dry seasons, and in wet seasons about seven or eight. The waters of eight streams flow into it, and four or five islands rise in the middle of the lake; the village of Vorneck has been built on the largest of these islands.

The lake disappears at irregular periods, and its waters escape through about forty clefts or apertures in its bed. The inhabitants then collect the fish that have not been carried away by the waters, and shoot the aquatic fowl that seek in vain for their haunts. The husbandman deposits the seed in the fertile ooze, trusting that his labours may be crowned by an abundant harvest; but his labour, his expenses and his hopes are often vain. By the same outlets, which served to drain the lake, the waters rise suddenly with a tremendous noise resembling thunder; the fish reappear, the teal and other water birds find their wonted asylum, and man alone complains of his improvidence.

Different mineral substances are found in the kingdom. Carinthia contains carbonate of iron, lead and zinc mines, which are situated in transition rocks, and also silver and copper.

The metallic veins in Carniola are not less abundant; but the quicksilver mines in the neighbourhood of Idria are the most valuable. These mines, together with others in Spain and at Deux-Ponts, supply the greater part of Europe. The quicksilver is found there in bituminous schistus. The metallic wealth of the country is transported by the Drave and the Save, which are the principal rivers, and by the Lisonzo^d and the Quieto, which throw themselves into the Adriatic Gulf.

The keen and cold air of the mountains near Villach and Klagenfurt prevents the vine from arriving at maturity; but the climate to the south of these mountains is wholesome and temperate. The stranger begins to feel the heat of the atmosphere in the circles of Laybach, Neustadt and Adels-

berg, and it increases gradually as he advances southwards. The chestnut tree and the vine flourish; the climate is favourable to them, and the only obstacle against which they have to contend, arises from the bad quality of the soil. The fig, the mulberry, and even the olive, thrive in the country round Trieste; it is seldom that they are exposed to any danger from frost. The vines are loaded with grapes, but their produce does not keep any length of time; the wines, however, that are produced in the valley of Vinodol, form an exception; they are brisk and sparkling, and for that reason might be called the champagne of the country. The domestic animals are not of a good kind; but the people in the vallies devote themselves principally to the rearing of silk worms.

Although Illyria is not a manufacturing country, the inhabitants are by no means indolent. Industry appears to be most diffused in the neighbourhood of Trieste and Fiume; among the produce of that industry, different works in iron and steel might be mentioned. The people near the shores of the sea are occupied in fishing or in building vessels. The inhabitants of the rest of the kingdom find employment in the carrying trade, or in conveying different sorts of merchandise imported by way of the Adriatic Gulf, and destined for Vienna and Hungary.

The vapours that exhale from the shores of the Adriatic are in many places injurious to health. Few strong men are seen in those districts; still the insignificance of the population must be attributed, not to the climate or atmosphere, but to other causes; it is certain that the number of inhabitants for every square league does not exceed seven hundred. They consist of Wends, Slavonians, Croatians, Germans and Italians, who in all make up one million two hundred thousand individuals. The most of them profess the catholic religion; the protestants do not amount to more than eighteen thousand persons. The German is spoken by the nobles in the greater part of the kingdom; but the people in Trieste speak a corrupt Italian idiom, and some Serbes retain their Slavonic dialect.^e

The freedom of the peasantry is subject to certain restrictions; the kingdom is said to be independent; it must be admitted that the people are nominally represented by the states. But the states are not a legislative assembly, their members have no power to enact laws; they are deputed by the clergy, the nobles and the towns; it is their province to regulate the amount and the distribution of the taxes. It has been calculated that the revenue of the kingdom is equal to six millions of florins.

The village of Ferlach, is situated on the banks of the Drave; it contains three thousand inhabitants, many of whom are employed in a manufactory of arms, which furnishes thirty thousand muskets every year. The small town of Saint Veit serves as a depot for the iron of Carinthia; its market-place is adorned with a fine ancient fountain.

Klagenfurt,^f the capital of Carinthia, is regularly built in the form of a rectangle; it stands on a canal which communicates with the lake of Werth. Fountains may be seen in all the squares and principal streets; the palace of the prince bishop of Gurk is remarkable for its numerous and

valuable collections. The town is peopled by nine thousand five hundred inhabitants; it has its public libraries, seminaries, agricultural and literary societies,^a hospitals and other charitable institutions. The inhabitants are said to speak the German language more purely and correctly than any others in the kingdom. The ancient town of Villach, and the village of Bleiberg in its vicinity, are both well known; the former on account of its white marble quarries, and the other for lead mines, which are considered the finest in Europe, and which yield annually more than thirty-five thousand quintals of pure metal.

Krainburg, a well built town on the Drave, was inhabited by the Slavonians in the eighth century; many antiquaries suppose it to be built on the side of the ancient *Santicum*. Laybach, in Slavonic *Lublana*, stands on both banks of the Laybach; its streets, though well paved, are narrow and irregular. The cathedral is admired for its paintings, and the townhouse for its Gothic architecture. Laybach is the seat of the government, and the council of censors meet in the same place. It is enriched by its carrying trade with Italy, Croatia and Bavaria. Gurkfeld is built on a hill planted with vineyards, at the foot of which flows the Save; it contains two thousand two hundred inhabitants; the principal buildings are a castle and a church. As several remains of antiquity have been discovered near Gurkfeld, it has been inferred that it was the ancient *Novidunum*. The fact, however, may be considered doubtful; indeed there is reason to believe that the ancient and celebrated town of *Novidunum* was situated at no great distance from Rain. Neustadt^b is frequented in the summer season by the strangers who repair to the warm baths at Tœplitz.

The town of Mœtting rises at the base of the mountains inhabited by the Uscoks (Germ. *Huskoken*), which are about forty miles^c in length. Many pilgrims visit Mœtting, but neither their example nor that of the peasants who repair to it in crowds at certain seasons, have infected the mountaineers; it must be admitted, however, that the Uscoks are a semi-barbarous tribe, depending chiefly on pillage for a subsistence.

Gottschee, a town of sixteen hundred souls, possesses a large and well built castle. The Gottschers, in the neighbouring country, amount in number to forty-four thousand; they may be distinguished from the other inhabitants by their manners, their language and their dress. They weave linen and make different articles of wood, which are exported to Austria and Hungary. The men are always armed with small axes, weapons by which they may be easily known. Idria stands in a deep valley in the Julian Alps; its Calvary is situated on a lofty hill, its quicksilver mines are very valuable, the passage that leads to them communicates with the centre of the town.^d

The names of the places in the government of Laybach are principally German, but in Trieste the most of the names are Italian. Görz or Gorizia,^e the chief town of a circle, contains ten thousand inhabitants. It stands in a fruitful valley on the banks of the Lisonzo; it has different societies, one of agriculture, another of arts, and a third of commerce.^f Monte Santo, a mountain famous for its wine, is situated in the neighbourhood. A Roman city rose formerly on the banks of the Anfora, which was

destroyed by the Huns in the year 452; the small town or rather the burgh of Aquileia now occupies its site. Encompassed by the lagoons of Marano, it cannot prosper until these pestilential marshes are drained by government.

Trieste, the capital of the government, was formerly the principal port in Austria; its castle was ruined by the French commandant in 1813, and there remains only a battery for the purpose of saluting the vessels that enter the roads. Trieste is divided into the old and new town; the latter is situated at the base of the mountain, the summit of which is crowned by the castle. The only public buildings entitled to notice are the exchange, a model of architecture, and the church of the Jesuits, which is remarkable for its fine front. Trieste is built in the Italian style; the houses are regular and the streets broad, particularly in the new town and in the suburbs, but in the old town the buildings are irregular and the streets narrow and dirty. It is impossible to walk in that part of the town during wet weather without being exposed to the torrents which fall from the house tops, or being compelled to stem the floods that rush through the streets. The exterior of the cathedral is only remarkable for the Roman remains with which it was built, and the interior, on account of the monument raised to the memory of the celebrated Winkelmann. Some remains of antiquity are worthy of fixing the attention; such, for instance, are the triumphal arch erected to Charlemagne, the remains of a Roman amphitheatre, and an ancient Roman aqueduct by which the town is now supplied with water. The harbour of Trieste has lately been improved; large ships can now enter it; it enjoys the privilege of free trade, which ensures the prosperity of its commerce. All the German geographers agree that the town contains at least thirty-six thousand inhabitants.^g

Capo d'Istria, a maritime town of five thousand four hundred souls, is built on a rock that communicates by a bridge with the continent; it is the metropolis of a bishopric. Pirano, which rises like a pyramid at the extremity of a cape, is peopled by six thousand two hundred individuals, most of whom are engaged in fishing or in building vessels, and also in cultivating the vine and olive. The principal church is situated on a height in the centre of the town. The inhabitants carry on a considerable trade, particularly in salt obtained from the adjoining lagoons. Parenzo, a small town, is remarkable for its cathedral, in which are seen mosaics of the tenth century, and consequently, at least eighty years older than those in Saint Mark's at Venice. Rovigno, a well built town, stands on a headland encompassed with rocks; its Gothic cathedral is its finest edifice. An active commerce, its fisheries and its coasting trade, serve to enrich its nine thousand six hundred inhabitants.

The small town of Pola near the cape called *Punta Promontorio*, exhibits the remains of that flourishing city which Cæsar destroyed on account of its devotion to Pompey. It might have been owing to the beautiful view which it commands, or to the interest which its faithful and attached inhabitants inspired, that Julia, the daughter of Augustus, persuaded her father to rebuild it; at all events, the town obtained the name of *Pietas Julia*. The pestilential air that rises from its lagoons, has, without doubt, contributed to its decay; it is only inhabited at present by eight

^g Thielens makes its population amount to forty thousand five hundred and thirty individuals.

hundred and fifty individuals. It might be difficult for the stranger who first examines it, to decide whether it be a Roman or a modern town; the streets and squares are covered with grass, and the soil in some places with the fragments of ancient buildings; most of the houses are uninhabited. The old castle, which is not yet finished, appears as deserted as the rest of the town. The cathedral is built on the site, and with the remains of a Roman temple. Two other temples, on one of which is inscribed a dedication to Augustus, a large triumphal arch, the *Porta Aurea*, a monument of conjugal affection,^a an amphitheatre, which, judging from its dimensions, might have contained fifteen thousand spectators, and many other ruins, still show how much the town was enlarged and adorned by Augustus.

Having arrived as the southern extremity of Germany, it is necessary to make some observations on the state of that country, and in the first place on the German possessions of the Austrian empire. These possessions, including Bohemia, Moravia and Silesia, the archduchy of Austria, Stiria, Tyrol and Illyria, form a superficial extent of three thousand five hundred and seventy-eight German, or nearly forty-nine thousand seven hundred English square miles;^b they are peopled by ten millions four hundred thousand inhabitants. Thus it appears that in point of surface and population, they make up a little more than the third of the whole empire. But the Germans do not amount to much more than half of the population, and their number has certainly been overrated by those who consider it equal to seven millions. It may therefore be easily imagined how much the difference of language, manners and customs tends to weaken their national spirit, and consequently their political force. Considered as a federative state, Austria possesses but few advantages; if the German provinces are attached to their government, an assumption that may be considered doubtful, it is not difficult to observe in Hungary and its dependencies, and particularly in Galicia, a sort of indifference, and in the Italian provinces, an avowed aversion to the power that governs them. The Austrian government may be anxious to reconcile discordant opinions, but it is by no means disposed to confound so many different interests by institutions which it considers dangerous, perhaps incompatible with the actual civilization of its subjects. It advances slowly on the beaten path, and accommodates itself to the prejudices of the people. Far from imitating Joseph the Second in his projects of improvement, it is rather the object of its policy to keep the people ignorant. It has even recently granted privileges to the Jesuits; Galicia had been already opened to them; they may ere long become as influential throughout the empire as in the time of their splendour.

The house of Austria, rich in its soil, its mines and in the industry of its inhabitants, ruling a population of about thirty two millions,^c maintaining an army of two hundred and fifty thousand men, and carrying on a trade producing £3,500,000,^d is not so formidable as many are apt to imagine. The revenue amounts to £16,035,000, and the public debt to more than six times that sum.^e The navy consists only of seven ships of the line, as many frigates and

ten or twelve brigs and sloops.^f It was determined by the last treaties that the course of the Inn should form a western boundary;^g that object of Austrian ambition has at length been attained; but Austria may wish to be invulnerable on other points besides those towards Bavaria. Although secure from the chances of an attack in that quarter, although now too powerful to fear the crescent that twice threatened to destroy it, a more formidable enemy may advance against it from the north. Galicia has been considered its bulwark in that direction, but that country, from its nature and position, could afford but a feeble defence in the event of an invasion. It is unnecessary to extend these general remarks, or to enter into details; the readers who may be desirous of obtaining further information concerning the resources, the means of instruction and the position of the German provinces under the Austrian empire, may be referred to the tables at the end of this book.

It may be asked what are the conclusions connected with the moral and political state of Germany, to which a stranger is likely to arrive, who traverses it in every direction, and who judges with impartiality. Is that vast federative state united by common interests? is it powerful from the resources which the different states that compose it, afford to each other; or is it not a country whose inhabitants are only united by the same language? Has the light of knowledge which has long been diffused over Germany, and the new institutions which have been thus rendered necessary, tended to improve the condition of the people? Such are the questions which it is now proposed to examine.

When more than three hundred states represented in the Germanic diet, acknowledged the supremacy of an elected chief with the title of emperor, Germany might have been considered a vast country divided into principalities or rather into governments.^h More detached from the rest of Europe, the Germans might then be said to have formed a single nation. But at present while Germany consists of forty-two independent sovereignties, some of which are sufficiently important to depend on their own resources, the federative bonds have been in a manner destroyed by conflicting interests; nothing of former Germany now remains; at least, it differs wholly from what it was during the sixteenth century. At one time the clergy and nobles possessed a decided preponderance and many privileges burdensome to the people. But the reformation first weakened and at last destroyed the temporal power of the clergy. The spirit of liberty has in later times made new conquests, and created new institutions.

No longer compelled to labour gratuitously for the nobles, governed by a comparatively small number of princes, the Germans have undoubtedly gained by the recent changes. The taxes have been distributed with greater impartiality, numerous roads offer more easy means of communication, and additional wealth has been diffused throughout every class of society. Some improvements have even originated amidst the evils of war; if the houses, says a German author, are now numbered in every town, it must be attributed to the necessity of finding quarters for the French soldiers; in the same manner, the custom of lighting the streets

^a The *Porta aurea* (It. *porta dorata*), a triumphal arch which now serves as a gate to the town, was erected by his wife, in honour of Sergius Lepidus. (Encyc. Method.)—P.

^h "Prefectures."

was not introduced before the seven years' war.^a Other writers have observed that since the residence of the French troops amongst them, the houses are better built and better decorated, the apartments more commodious and the furniture more substantial. If the wars of Napoleon were for a season disastrous to Germany, that celebrated person ought perhaps to be now as much regarded by the Germans as he was execrated by them when he oppressed the country with the weight of his power; for the continental system tended to expand those germs of industry, of which the people are beginning to reap the blessed fruits.

The Thuringer-Wald divides Germany into two regions, the northern and the southern. The northern Germans living on bread, potatoes, butter and cheese, and drinking occasionally beer and spirits, are stronger, more frugal and more enlightened; protestantism has made most proselytes amongst them. Delicate in their manner of life, accustomed to wine, sometimes addicted to drunkenness, the southern Germans may be more lively, but they are also more superstitious. In northern Germany, numerous habitations, villages adorned with fountains, neat and clean houses, excellent roads lined with fruit trees, and well cultivated fields proclaim the wealth and intelligence of the inhabitants.

Many castles, the remains of feudal times, begin to appear in the country near the Black Forest. These and the different monuments throughout Germany are kept in good repair; if they fall to ruin, it cannot be imputed to negligence but to time, which is often more ready to destroy than the hand of man to preserve.

A distinguished writer^b calls Germany *the country of thought*. The unnumbered philosophical and metaphysical systems from the time of the profound Leibnitz to the days of the unintelligible Kant, might perhaps entitle it to such a designation. It has been said correctly that the country abounds with learned men; they are not as in other states confined to the capital; they may be met with in the smallest towns. As to the physical sciences, they have been cultivated with as much success as in other countries; they are now more encouraged by the different governments than by the government of that nation, which boasts, perhaps not without reason, of having been pre-eminent in Europe, in the career of science. However painful it may be for a Frenchman to humble his national pride before strangers so long his inferiors, it must be admitted that among the advantages of the late peace, are those which have enabled different states in Germany to compete with France in the most attractive and most useful departments of knowledge. It is sufficient to visit the collections at Munich, Berlin and Frankfort, and to converse with the distinguished men in those towns, to be convinced that the Germans are not surpassed by their neighbours. Equal to other nations in theology, jurisprudence, history, philology and medicine, they are only inferior in political knowledge; but the means of acquiring it are rapidly increasing; more than six hundred journals and newspapers are now published in the country.

The method of public instruction adopted in the universities is superior to that used in the French colleges. It may be remarked, that, although the youth are taught to read Greek and Latin in a shorter period than eight years, there are in no country more celebrated classical scholars and archaeologists.

^a Deutschland, oder Briefe eines in Deutschland reisenden Deutschen.

^b Mad. de Staël, de l'Allemagne.

Gymnastics form a part of the system of education in several states of Germany; it has been said that such exercises, besides their advantage in rendering the body flexible and robust, have a salutary influence on the moral character, or that young men fatigued by this healthful labour are more apt to avoid the dangerous propensities which are too often the consequences of effeminacy and repose.

As society has few charms in Germany, the enjoyments of reading and study are necessarily better appreciated than in other countries. Music appears to be almost an innate art with the Germans. Students may be seen walking in procession, and singing hymns of praise to the divinity; the peasant during his intervals of labour often composes an air on a wretched harpsichord; and the shepherd makes the woods re-echo the harmonious notes of his flute.

The population of Germany amounts to thirty millions five hundred thousand inhabitants, who are dispersed over a surface of twelve thousand German or more than a hundred and fifty thousand English square miles,^c so that the average number of individuals for every German square mile is equal to two thousand five hundred and forty-two. According to statistical accounts, there are about sixteen millions of catholics, fourteen millions of protestants, twenty-five thousand Herrnhutters or Moravians, two thousand five hundred Mennonites, fourteen thousand of the Greek or eastern church and three hundred thousand Jews.^d The revenue amounts to at least two hundred millions of florins, and the military force exceeds three hundred thousand men.

Germany has not a single naval station, and it is besides deficient in canals, particularly in the southern parts of the confederacy; nor until the debt shall be liquidated, the representative system better established, a navy created, inland commerce less shackled by custom-houses, the coinage as well as the system of weights and measures rendered uniform, and the people more united, can it become flourishing within, and respected without.

STATISTICAL TABLES

OF THE

GERMAN PROVINCES UNDER THE AUSTRIAN EMPIRE

A. KINGDOM OF BOHEMIA,

DIVIDED INTO SIXTEEN CIRCLES.

	Population
1 Rakonitz	160,299
2 Beraun	163,389
3 Haurzim	181,631
4 Bunzlau	375,532

^d M. Kudler supposes that the population of Bohemia has doubled within the last 230 years, and that of Moravia and Silesia within the last 296 years. According to the same author, the other provinces present as striking variations.

^e These details are taken from the work entitled: The World compared with the British Empire, by M. A. Balbi.

BOOK CXXX.

EUROPE.

Europe Continued.—Switzerland.

SWITZERLAND is considered in point of romantic and picturesque scenery, the finest country in Europe. To give an account of such a country, to mark the contrasts between verdure and eternal snow, silent forests and roaring cataracts, fruitful vallies and sterile mountains, and to delineate all the varied pictures of gigantic nature, form a task as difficult for the writer as the painter. Switzerland besides is so well known, it is so often the subject of conversation, that even those who have never seen it, are enabled to judge of it with sufficient accuracy. To describe the most important features of the country, and whatever it contains most worthy of notice, is the object of the present book; itineraries are not wanting to guide the travellers who wish to examine it minutely.

Switzerland is bounded on the west by France, on the north by the grand duchy of Baden and the kingdom of Wirtemberg, on the east by the Austrian province of Tyrol, and on the south by the Sardinian and the Lombardo-Venetian states. Its extent from west to east is equal to nearly two hundred English miles, and from north to south to a hundred and fifty. The superficial extent of the country does not exceed twelve thousand English square miles.^a

Two distinct ranges of mountains traverse Switzerland. The chain of the Jura stretches from south-west to north-east; that of the Alps, which is much more extensive, is nearly parallel to the former, but numerous and important branches extend from it in every direction. The length of the first is about two hundred and forty or two hundred and fifty miles, while its breadth varies from thirty-five to forty.^b Precipitous and abrupt towards the Alps, it becomes gradually lower on the side of France. It is principally formed by calcareous rocks of a greyish or bluish colour, which in some places may be wrought as marble. Organic remains are by no means uncommon, such as the bivalvular shells which geologists have termed *gryphites*, the spiral and multilocular shells which, from their configuration, have been called *ammonites* or horns of Ammon,^c and those singular conical remains that have received the name of *belemnites* or thunderbolts.^d The calcareous strata alternate with layers of fine sand, to the height of eighteen hundred feet; but in some places they are separated from each other by layers of angular or rolled pebbles, that could only have been united in the depths of the ancient ocean, by the calcareous cement that envelopes them. These pebbles are fragments

of the different granitic rocks that form the nucleus of these mountains and the summits of the Alps. The geologist cannot observe without interest, on the declivities of Jura towards Switzerland, the innumerable blocks of granite at the height of two thousand feet above the lake of Geneva, which have been apparently conveyed thither from more elevated summits.

The Alps afford the materials of continual study and reflection to the geologist who examines them. Among the phenomena thus presented to his notice, some have not been sufficiently observed, although all have been often explained by the aid of hypotheses and different theories. The immense masses that constitute the Alps, exhibit at first sight the appearance of confusion and disorder; they seem the venerable witnesses of the natural convulsions which took place when the earth assumed the form assigned it by its creator. Inaccessible peaks covered with snow; summits from their almost perpendicular sides, not unlike gigantic obelisks; vallies surrounded with immense precipices; rocks almost consumed by time and ready to fall from old age; such are the phenomena which the Alpine chains present. But if the observer who surveys them be familiar with the study of nature, he may see marks of its slow and gradual course amid the traces of destruction and decay. Ebel has shown that the most ancient deposits in these mountains are arranged in strata having a direction from west-south-west to east-north-east. Granitic rocks of a date posterior to the formation of organized beings,^e make up the chain connected with Mount Blanc, the highest mountain in Europe. Different calcareous ramifications of the same chain extend a long way northwards, and rise to a great height, while the granitic rocks on the south descend to the confines of Italy. Nothing can be more imposing than the appearance of Mount Blanc, towering high above all the surrounding mountains; the other summits which encompass and incline towards it, have been compared by a geologist^f to humble subjects, anxious to contemplate and pay homage to their sovereign. Mount Cervin appears like a triangular pyramid, and its summit, which consists of serpentine, rises to the clouds. But the circular arrangement of some of these heights may be considered the most remarkable phenomenon which they exhibit. Mount Rosa, for example, is formed by an uninterrupted series of gigantic peaks that enclose an immense circle, nearly six thousand yards^g in diameter. Geologists have

^a "Extent from west to east about 80 leagues, from north to south 50 leagues; superficial extent 2400 square leagues." [19,000 Eng. sq. miles, Morse.]

^b "Length, from 90 to 100 leagues; breadth, from 15 to 18."

^c *Cornua ammonis*.

^d The *belemnite*, like the *ammonite*, is an univalvular and multilocular shell.—P.

^e The *protogine* of Jurine, the talcose or steatitic granite of Daubuisson.

^g "About 3000 toises."

looked in vain for the traces of ancient volcanoes in the Alpine chains; the ocean only has left marks of its former existence.

The sun melts superficially the masses of snow that cover the highest regions, and the snow thus melted, is afterwards converted into ice. These glaciers are often inclined, and always divided by large and deep fissures, whence their forms are generally very varied and fantastic. According to their greater or less inclination, the glaciers descend a short distance at the approach of spring, but their course is soon interrupted; still the motion to which they are subjected, causes numerous fractures, which are accompanied with loud and tremendous reports, re-echoed from mountain to mountain. These effects are the causes of others not less remarkable; the violent shock given to the air is communicated to the snow, which is also shaken; some portions of it are detached, which rolling downwards increase in bulk, and occasionally overwhelm habitations, villages and forests. Ebel concludes from a series of observations, that the ice descends annually in the channels of the glaciers, from twelve to twenty-four feet; if the average descent be estimated at eighteen feet in one year, or about three miles in nine hundred years, and if it be considered that portions of rocks have been gradually dragged by the ice in some glaciers over inclined plains more than twenty, or even thirty miles in length,^a some notion may be formed of the immense period necessary for their formation. These great natural movements have been thus described by an eye witness, the clergyman of Grindelwald, who had gone with some of his friends to visit the famous glacier in the neighbourhood of that village. "My friends and I had hardly sat down on the ice to rest ourselves," says the clergyman, "when we witnessed that singular phenomenon, the *growth* or *swelling* of the glacier."^b It was accompanied with a tremendous noise; every object around us seemed to move of its own accord; guns, sticks and game-bags, all were overturned; rocks apparently fixed in the ice were detached and dashed against each other; crevices from ten to twenty feet wide were opened, while others closed as suddenly, and the water contained in them was thrown to a great height. The whole glacier, thus agitated with so much violence, advanced a few paces, but tranquillity was soon restored, and the usual stillness was only interrupted by the whistling of the marmot."^c

The Rhine which pursues its sinuous course from Mount Saint Gothard to the lake of Constance; the Inn which descends from Mount Bernina; the Adda which rises at the foot of Mount Gallo, and throws itself into the lake of Como; the Tesino which issues from Mount Gries, and traverses Lake Maggiore in Italy; the Rhone which is formed by different streams from Mounts Grimsel and Furca, and which conveys its waters to the lake of Geneva; the Aar, a branch of the Rhine, which flows through the lakes of Brienz and Thun, after having formed several lofty cataracts; and lastly, the Limmat which descends from the Limmeren-Alp, traverses the lake of Zurich, and unites with the Aar, water the finest and largest vallies in Switzerland.

Besides the different lakes which have been enumerated, two important ones may be added, those of Lugano and Lu-

cerne, and two others less extensive, those of Morat and Bienne. The lake of Neuchatel has already been described in the account of the principality and the town from which its name has been derived. All these lakes form a superficial extent of fifty-two square leagues, or three hundred and fourteen square miles.^d The fish that they contain, are the pike, the trout, the salmon, the burbot and the umber;^e the latter a very delicate fish occasionally exported to Paris, where it is sometimes sold for so high a price as £12.

The mountains in Switzerland abound in useful substances, such as porphyry, marble and alabaster. Iron, lead, copper, zinc, cobalt, bismuth, arsenic and antimony are found in veins and in masses; rock crystals are very common, sulphur is collected in many places, and some rivers, as the Rhine, the Aar, the Adda and the Reuss, carry down gold. Beds of lignite or bituminous wood are worked in several vallies, and the inhabitants use it for fuel.

More mineral springs are situated in Switzerland than in most other European countries. The acidulous waters of Saint Maurice in the canton of the Grisons, the baths of Gurnighel in Berne, and the warm springs at Baden are well known; but the most frequented of any are those at Pfeffers and Leuk. The sulphuretted hydrogen contained in their waters render them salutary in diseases of the skin. The goitres to which the inhabitants are subject in some cantons, particularly in Berne, Lucerne, Friburg and the Valais, may probably be attributed to the carbonate of lime held in solution in different springs.

Ebel and other botanists divide the Alps into seven regions. The lowest, or that of the vine, commences in the vallies on the banks of the rivers and lakes, and terminates at the height of seventeen hundred feet above the level of the sea; the next, or the region of oaks, rises to the height of two thousand eight hundred feet; that of the beech succeeds and reaches to the height of four thousand feet; that of the firs is next in order, and rises five thousand five hundred feet above the level of the sea; at that height the lower Alpine region commences, where the trees give place to fruitful pastures, which rise a thousand feet above them. The higher Alpine region commences at six thousand five hundred, and terminates at eight thousand two hundred feet; in places sheltered from the sun, the snow remains throughout the year; the region of glaciers and eternal snow rises above it. The two last regions are not wholly destitute of vegetation; saxifrages, gentians and other hyperborean plants flourish there.

The weasel, the pole-cat, the ferret, the lynx and the squirrel are found in Switzerland. Different kinds of game are not uncommon; among others the white hare, of the same species as that found in Siberia, together with the chamois and the marmot, both of which are considered great delicacies. The other animals are the hamster, a species of rat prized for its fur, different kinds of martens, the wild boar and the bear; but the last are at present much more rare than formerly; they seem to be almost confined to the mountains of the Valais.

The antipathy that subsists between the bear and the bull is not less certain than remarkable. A well informed traveller states that as soon as these animals perceive each

^a "10 or 12 leagues."

^b "*Crue de glacier.*"

^c The account given by the clergyman of Grindelwald was published in a work by Professor Wiss, quoted in the first volume of Simond's travels in Switzerland (Fr. edit.)

^d Reckoning the leagues as French post leagues—if geographical, nearly 400 sq. miles.—P.

^e "*L'ombre chevalier,*" *Salmo Umbla*, Linn.

other, the bull becomes unmanageable, they fight furiously, and seldom separate before both are exhausted; but what is most strange, they generally meet, as if by appointment, on the same place the next day, and continue the combat until one of them falls.^a

The chamois are also rapidly decreasing; man is not their only foe, they have also to escape from the great eagle of the Alps. The king of birds discovers the swift quadruped, and forces it by feigned attacks to fly to the highest summits. The timid chamois too often makes for the brink of a precipice, its place of shelter from the hunter. But such a position is most favourable for its adversary; while the chamois presents its horns in an attitude of resistance, the eagle strikes it with its wings, and hurls it headlong from the precipice into the valley, where it feeds on its carcass.

But according to Mr. Coxe, the eagle has to contend against the numerous ravens in the Alps. The battles in which they engage, are interesting from the aerial evolutions made on both sides. The ravens formed into straight lines, and divided into several battalions, attack the eagle on every side, and are often replaced by troops of reserve; indeed it happens most frequently that the eagle is obliged to seek safety in flight. The Alpine eagle measures sixteen or seventeen feet between the tips of the wings; it carries off lambs, kids and dogs; man never spares it, but it is seldom that it comes within his reach. Ebel vouches for the truth of the following anecdote, which evinces certainly no ordinary coolness and address. A hunter having discovered an eagle's nest, killed the male, and then climbed the rocks to seize the young, when at the moment he was putting his hand into the nest, the mother pounced upon him, and fixed her talons on his arm, and her beak in his side. The hunter had presence of mind to stand still, for had he moved, he must have fallen to the bottom of a precipice; holding his gun with one hand, and supporting it against the rock, he took his aim, pulled the trigger with his foot, and shot the eagle. Ebel adds that he was forced to remain in bed for a month, from the wounds he had received.

The Swiss are descended from the ancient *Helvetii*, and from the people that inhabited their country at a later period. History makes no mention of the *Helvetii*, until about a hundred years before the Christian era. Although it may be difficult to trace their origin, it is highly probable that they are sprung from a very ancient branch of the Celtic race. The lofty ridges of the Alps must have risen first from the depths of the ocean, and they may also have been inhabited before any other country in Europe.

An author whose erudition cannot be too highly commended,^b has brought together several important facts to prove that Greek colonies settled in the country long before it was known to the Romans. Five centuries afterwards, when Julius Cæsar undertook the conquest of Gaul, and defeated the *Helvetii* then marching to invade it, a register of their army written in Greek characters, was found among their baggage. In alliance with the *Cimbri* and different German nations, they had invaded the country as far as *Marseilles* fifty years before that period, and defeated the consul *Silanus*. *Cassius* being sent to give them battle, crossed the Alps, but they returned, and destroyed his legions not far from the place where the *Rhone* throws itself into the lake of *Geneva*.^c If *Divico*, their chief, had known

how to improve his victory, he might have made himself master of *Rome*; at all events the Romans were then trembling for their safety, and deploring the defeat of their general. But the allies divided their forces, and *Marius* conquered them in two battles, first near *Aix* in *Provence*, and afterwards on the banks of the *Adige* in *Italy*.

These victories were, however, insignificant, when compared with the one that *Cæsar* gained over them. Two hundred and sixty-three thousand *Helvetii* and a hundred thousand allies from the *Jura*, the lake of *Constance*, *Tyrol* and the *Grisons*, began their march, after having burnt twelve towns and four hundred villages in their own country, determined never to return home. Men, women, children, carriages and cattle were accompanied by ninety-two thousand combatants, commanded by the same *Divico*. A hundred thousand *Helvetii* were all that escaped the arms of the Romans; *Cæsar* permitted them to rebuild their habitations. The people were included after this defeat among the allies of the republic, but their independence did not continue longer than six years. They were afterwards ranked among the people subject to *Rome*, and made liable to all the hardships which the Romans imposed on conquered nations.

The first foreign invasion of *Switzerland*, happened about a hundred years after the Christian era. Not more than two centuries afterwards, the seeds of Christianity were sown in the country; it still continued subject to the emperors, but in the fourth century it changed its masters. A population consisting of *Alemanni*, *Longobardi*, *Vandali*, *Burgundiones* and other nations that appeared for the first time in history, subdued the greater part of the country. The conquerors had already mixed with the conquered, and formed a new nation, when *Helvetia* was again desolated by the hordes of *Attila*. But the *Burgundian* race continued in the country; they had their kings, and *Geneva* became the place of their residence. The *Helvetians* were less oppressed by the barbarians, than they had been by the Romans.

The druidical worship of the ancient *Helvetii* was amalgamated with that of their conquerors. *Hesus* and *Teutates*, *Belenus*, the god of light, *Taranis*, armed with thunder, *Siwa*, the divinity of the *Grisons*, and *Penninus*, the god of the people in the *Valais*, shared the homage of the inhabitants. A few Christians inhabited, however, some vallies in the *Jura* from the third to the seventh century, when some Scottish monks came to preach the gospel to the heathens in *Helvetia*, and *Gall*, one of them, acquired so great a reputation for sanctity, that the celebrated abbey of *Saint Gall* was erected as a tribute to his memory about fifty years after his death. Can the resistance which the *Helvetians* opposed to new invaders, be attributed to the influence of a religion that then began to enlighten a degraded people?

The *Huns* invaded *Switzerland* in the eighth century, but their army was wholly defeated; two hundred years afterwards, hordes made up of *Hungarians*, *Moors* and *Saracens*, as they are called in history, appeared twice in the Alps; they burned the villages, and plundered the country during fifty years, but were at last destroyed by the brave mountaineers. The names of some places, such as *Maur-Mont*, *Mauro-Fonte*, and the *Wall of the Saracens* near *Avenches*, serve still to attest their residence.^d

^a Coxe's Travels in Switzerland.

^b Muller's History of Switzerland.

^c Cæsar—Book I.

^d Simond's Travels in Switzerland, Volume Second.

Helvetia was under the protection of the German empire; Rudolph of Hapsburg, in the height of his power, formed the project of uniting the different parts of Switzerland into a single sovereignty. Albert, his son, followed the same policy, but the inhabitants were much oppressed by his officers. Gessler, in particular, rendered their yoke very burdensome, and William Tell, by putting that tyrant to death, paved the way for the deliverance of his countrymen. Three heroes, whose names are revered throughout the republic, namely, Werner from the canton of Schweitz, Walter Furst from that of Uri, and Arnold from that of Unterwalden, resolved in 1308 to take possession of the strong-holds occupied by the Austrian governors. The secret of their conspiracy was so well kept, the measures concerted with such wisdom, and executed with so much courage and intrepidity, that the result was the independence of their country. But the *Waldstetten*^a or the three forest cantons of Schweitz, Unterwalden and Uri, which have been already mentioned, constituted at that time the whole of free Helvetia. They formed the confederation of Schweitz in 1315; at a later period the other cantons were successively included, and in 1513 Appenzell completed the federative republic, of which the independence was confirmed and secured by the treaty of Westphalia.

In 1798, Switzerland, like many other countries, was obliged to submit to the laws which victorious France dictated; part of its territory was taken away, and the government was changed. Geneva, which had been ceded to France, was restored in 1815, and the country was at the same time divided into twenty-two cantons.

The ancient gods of Helvetia ceased to be worshipped after the introduction of Christianity, but other beings of the imagination have occupied their place. The forests and mountains are believed to be peopled with spirits, and it is supposed the causeway of Pierre Pertuis,^b as well as the natural bridge which rises above it, were constructed by the devil; the aperture is about thirty or forty feet in breadth, and twenty in height, and the breadth of the arch about twenty-five feet.^c The reformation of the sixteenth century was not embraced by all the inhabitants. The cantons of Bale, Berne, Vaud, Schaffhausen, Zurich, Geneva and Neuchatel separated from Rome. Soleure, Friburg, Lucerne, Zug, Schweitz, Unterwalden, Uri, Tesino and the Valais have continued catholic. The cantons of Aaragu, Glaris, Thurgau, Saint Gall, Appenzell, and the Grisons are partly peopled by catholics and partly by protestants.

Several languages are used in different parts of the country, but the German more generally than any other; the people in the greater part of Switzerland speak it, but it is the harshest and most guttural of the German dialects. The inhabitants of Vaud, Neuchatel and Geneva, and a part of those in Berne, Soleure, Friburg and the Valais, speak French; but the lower orders in the same cantons^d make use of a peculiar idiom,^e which has been considered a compound of Celtic, Greek and Latin; it is divided into several dialects, and is apparently the most ancient lan-

guage in the country. The Italian is spoken in the canton of Tesino, and in a part of that of the Grisons.^f

The honesty, simplicity and moral purity of the Swiss have been greatly overrated. The wealthy who travel through Switzerland, are apt to be misled by the impressions produced by a country abounding in romantic sites, and differing so much from the rest of Europe, and besides the only country inhabited by shepherds and husbandmen living under a popular government. The peaceful life of the mountaineers makes the citizen envy their destiny; he believes them happy, because he is rendered so himself by the new sensations which the variety of objects creates; he forms a high idea of their virtue, because removed from the sphere of ambition and intrigue, he supposes them to be without ambition, care, or vice. Thus, the inhabitants of towns are apt to suppose that happiness can only be found in the country; it is however but too well known that examples of virtue and good morals are not always to be met with in villages. In Switzerland, as in every other country, ignorance and poverty are rarely united with moral qualities; in the cantons where education is diffused, where industry and commerce are sources of wealth, the people are contented and happy. Religion exerts a beneficent influence, and the spirit of union and tolerance, which pervades every class of the community, may in part, at least, be attributed to protestantism.

If the Swiss have little taste for the charms of society, they are perhaps on that account more susceptible of other enjoyments; domestic happiness, conjugal and parental affections, as well as the other virtues of private life, are more common in Switzerland than in countries where social pleasures are better understood, and where the feelings are less concentrated. The men meet, but it is to converse, smoke and walk about a chamber, where three chairs are sufficient for twelve persons. It is not difficult to discover the character of an individual almost at the first interview, so great is the simplicity of manners, so little effect has been produced by the usages of society. Thus, says a Swiss author,^g "at the concert or the church, at every place where a number of persons are assembled, but most of all at a play, which being seldom permitted, is on that account more frequented, it is impossible not to observe the prodigious diversity of physiognomies in people of every age, but particularly in the young, the extreme mobility of their features, and the ingenuousness and vivacity of their expressions."

Bravery, the love of labour, attachment to their country, and respect for ancient customs and institutions, form the principal features in the national character. The mass of the people are more enlightened than in other countries; in some cantons, not only the wealthy but the peasantry cultivate literature and the arts. The human mind, however, is made up of so many contradictions, that in Switzerland, where liberty has been established for several ages, some remains of the worst of governments are suffered to exist; justice is privately administered, and the torture is still in use.

^a Germ. *Waldstadte*. ^b Lat. *Petra Pertusa*, the perforated rock.
^c The aperture is very irregular in its form, full 30 feet in its least breadth and 50 in its greatest; the height about 20 feet. The thickness of the rock on one side of the opening is 25 feet, and on the other 29. (Simond's Travels in Switzerland.)

^d Rather in the districts where French is spoken.—P.

^e "Un patois welche ou Roman."—In the table of population p. 760, this is made to include the Grisons. In the table of European languages,

Book XCVI. the *Rhatian*, spoken in the Grisons and Tyrol, the *Valaisan*, spoken in the Lower Valais, and the *Helvetic*, spoken in the western Swiss cantons, are all classed together under the head of *Romanic* (Romanish) of the Alps. See Note (f)—P.

^f The inhabitants of the canton of the Grisons may be divided into three classes according to their languages, viz. Italians, Proper Grisons, who speak the Romansh language, and Germans.—P.

^g Meister's Travels from Zurich to Zurich.

Different costumes, of which the origin is very ancient, distinguish the people in most of the cantons; in several, sumptuary laws have been introduced, a wise and salutary measure in a country where independence and liberty are fostered by the absence of luxury. Games of chance are prohibited, but gymnastic exercises are the daily amusements of the young; they engage in the race, in wrestling, in throwing the dart, or in shooting at a target. Although the Swiss are not a poetical people,^a it is certain that of all the arts, music is the one most generally cultivated.

The different branches of agriculture are well understood in Switzerland, and if it were not for variable seasons, it might be unnecessary to import grain or other articles of primary necessity. The extent and fruitfulness of the pastures are favourable to the propagation of cattle; the oxen are remarkable for their size, and the cows, particularly the short-horned breed in the valley of Gruyeres, are much prized in different countries. The horses, though neither swift nor well made, are strong and hardy, but as the mule is more sure-footed, it is the most common beast of burden in the mountains.

The commerce of the different cantons has been much diminished since the last treaties. The prohibitory system introduced by neighbouring states, has necessarily confined the outlets which the Helvetic confederation found formerly for its cattle, leather, cheese, hemp and flax, and for its watches and muslins, but its pharmaceutical plants form still a considerable branch of exportation.

The canton of Schaffhausen, one of the smallest in Switzerland, is situated at the northern extremity of the country. The capital of the same name is the only town of any consequence, and it must be confessed that it contains little or nothing remarkable. Its port was frequented as early as the eighth century; it was called *Schiffhausen* or a shelter for vessels,^b from its position above the cataracts of the Rhine. The town possesses an academy, a gymnasium, several schools and a bible society. The trade, which is considerable, consists in cotton stuffs, silks and leather. The strangers, who repair to the celebrated fall of Lauffen, one of the most remarkable in Europe, generally visit Schaffhausen.

Frauenfeld, the capital of Thurgau, contains three large and fine streets, and several silk manufactories. Bischofszell, a small town, is peopled by husbandmen.

Saint-Gall is distinguished as a commercial and manufacturing town, but the only curiosities are the remains of its ancient abbey, and the manuscripts which are contained in it. The people in the adjacent territory are among the poorest in Switzerland; they are degraded by ignorance and its attendant vices.

Appenzell, which surrounds the last canton, presents a very different spectacle; the greatest industry prevails through every part of it. The capital of the same name is only a burgh; Herisau is a place of greater consequence, and possesses a more flourishing trade.

Zurich is remarkable for its romantic situation, and for the fine views that extend from its ramparts and public walks. The materials of its commerce are supplied by its cotton, hat and soap manufactories. It was distinguished in the middle ages by the reformer Zuinglius, and since

that period, by the illustrious men, who have been born in the town. To be convinced of its just claims to celebrity, it is sufficient to mention the names of Gessner, Lavater and Pestalozzi. Its libraries are rich in manuscripts, in medals and in collections of natural history.^c Its schools are numerous, its academy is frequented by many strangers, and its scientific societies might be creditable to larger and more populous cities. The small town of Winterthur rivals Zurich in the industry of its inhabitants; in its library, there is a fine collection of medals and engraved stones, found in the village of Ober-Winterthur, which stands on the site of the ancient *Vitodurum*.

Aarau, or Arau, the capital of Aargau, although an old and dirty town, is a place of considerable trade. It possesses several charitable institutions, and schools to which parents are obliged to send their children. A numerous collection of manuscripts relative to the history of Switzerland, forms the most valuable portion of its library. Aarau is the only town in the confederation where meteorological observations are registered. Baden is known from its baths which the Romans called *Aquæ Varbigenæ*. Tacitus informs us that these baths were finely built, and the same writer commends their salubrity. A great many antiquities have been found near the town, among others, a statue of Isis, which was long worshipped under the name of Saint Verena.^d The small town of Zoffingen is well built; it possesses several fine edifices, a library and a collection of medals. The only fortress and the only arsenal within the limits of the confederation, are situated at Aarburg or Arburg.

Bale, Basil or Basle, which Ammianus Marcellinus calls *Basilica*, was the most important town in Helvetia during the eleventh century; it was also during a long time the only one in Europe, where the art of printing was carried to a great degree of perfection. Many illustrious men have been born within its walls, among others, the Bernouillis, the Eulers, and the celebrated Holbein; several paintings by that distinguished artist, are carefully preserved in the university. Erasmus died at Bale, and left his valuable library to the same institution; it possesses besides, a collection of twelve thousand Roman medals, and other antiquities found at Augst, the ancient *Augusta Rauracorum*, at some distance from the town. The statue of Munatius Plancus, the founder of that colony, may be seen in the tower of the townhouse. The population of the town has decreased since the sixteenth century, but it is still adorned with several fine streets and spacious squares. The hospitals and charitable institutions are richly endowed, and the method of instruction proposed by Pestalozzi, has been adopted with great success in the different schools.

The situation of the town is very romantic. The cathedral stands on a lofty terrace shaded by horse-chestnut trees; it commands an extensive view of the Rhine, but the river assumes the character of an impetuous torrent, more likely to desolate than to fructify or facilitate communications in the country through which it flows. "I could not perceive," says Simond, "a single boat in that part of its course; its waters are of a whitish blue colour, not unlike those of the Rhone; indeed it is easy to discover a sort of family resemblance between these two large rivers, which

indicates their common origin." Little Bale, on the opposite bank, communicates with the town by a bridge built of stone at the two extremities, and of wood in the middle, on account of the depth and rapidity of the current. The mountains of the Black Forest bound the horizon towards the north-east.^a Bale has been more than once overturned by earthquakes; it was desolated by the plague in the fifteenth century, and it has been affirmed that with the exception of one, all the members of its council fell victims to that disease.

Soleure is a place of considerable trade; its broad and well paved streets are adorned with fountains, and a number of baths have been built on the Aar. The principal church^b is considered one of the finest in Switzerland. The late improvements in the system of education have not yet been adopted in the town, although their advantages have been acknowledged in the rural districts. The prisons, workhouses and hospitals in Soleure are much better managed than others in places of greater importance.

Several important towns are situated in the canton of Berne. Porentrui carries on a considerable trade in leather. Burgdorf, or, according to its French name, Berthoud, is well known from the institution founded by Pestalozzi. Many silk worms are reared at Bienne; its celebrated lake is three leagues in length, one in breadth,^c and two hundred feet in depth. The houses are curiously painted and built upon arcades, and the squares are decorated with old fountains, the most of which were erected during the fifteenth and sixteenth centuries. The long hair of the women descends below their petticoats, but the latter hardly reach to their knees.

Berne or Bern, the chief town in this wealthy canton, is well built, but the streets are gloomy and deserted. The town is kept clean by the numerous fountains and limpid streams which water it. The magistrates have not sacrificed utility to appearances; hospitals, and store houses in which grain is deposited and used in seasons of scarcity, are the first objects that the stranger remarks on entering Berne. The commerce of the town is not very great, but the inhabitants are comparatively affluent; no mendicants are seen in the streets. The edifices and places worthy of being visited, are the arsenal, the cathedral which was built in the sixteenth century,^d the church of the Holy Spirit, finished in 1704, the library, different scientific collections and the monument in the botanical garden, erected to the memory of the great Haller, who was born in the town. The situation of Berne on a height renders it salubrious, and accounts in some measure for the frequent instances of longevity. Its name, which is derived from the German word *bär* (bear,) has given rise to different opinions concerning its origin. It has been supposed that Berthold the Fourth, duke of Zæhringen, and the founder of the town, called it Bærn, from having killed a bear in the vicinity. The figure of the same animal forms the city arms,^e and it is perhaps for these reasons that several bears are still kept in the intrenchments.

Sursee and Sempach are two small towns in the canton of Lucerne; they are agreeably situated at the two extremities of a lake to which the last town has given its name. But Lucerne is still more remarkable for its fine lake, part

of which lies beyond its territory, and is called the lake of the Four Cantons. The mountains of Righi^f and Pilate^g are reflected from the surface of its waters, and the most romantic views may be seen from the chapel of Maria Zell and other elevated situations in the neighbourhood. The broad and modern streets of Lucerne are surrounded by fortifications that were built in the fourteenth century. Covered wooden bridges, one of which is thirteen hundred and eighty feet in length, are erected across the Reuss, and unite the two quarters. The townhouse is richly adorned; the armour of duke Leopold, and other trophies gained at the battles of Sempach and Morat, are deposited in the arsenal. The former of these engagements was fought in 1386, and the latter in 1476. Different antiquities are preserved in the cathedral; the libraries, which are rich in manuscripts, the celebrated model of Switzerland constructed in relief by General Pfyffer, the learned societies, the colleges and the schools, give the town an importance that forms a striking contrast with its scanty population.

The canton of Zug is smaller than any other in Switzerland, and its capital of the same name was probably one of the towns which the Helvetii burned, when they made an incursion into Gaul in the time of Julius Cæsar.

Schweitz, which might be more correctly called a burgh than a town, is situated at the base of the Mythen mountains; almost all the houses are ill built. The pilgrims of Switzerland, and others from many parts of Germany and France, meet at the village of Einsiedeln in the same canton. The convent of the Benedictines possesses a supposed miraculous image of the Virgin, and a piece of silver impressed with the hand of the Saviour. Those who wish to have their sins forgiven, must put their fingers into the five marks in the silver, and drink out of the fourteen pipes of the fountain in front of the convent, because from one of them, at present unknown, Jesus quenched his thirst. Rapperschwyl is an old and almost deserted town; but its sombre aspect harmonizes with the romantic country that surrounds it.

No hostile army had invaded the canton of Glaris during more than four hundred years; but it was at last devastated by the French, the Austrians and the Russians, in 1798. Whatever could serve for food or clothing, was pillaged by the soldiers. The inhabitants of this rich canton were reduced to poverty; the last bottle of wine in the valley of Sernft, was offered to Suwarrow and the grand duke Constantine, during their precipitate retreat. Glaris differs from most other towns; its character is wholly Swiss; the antiquated manners of its inhabitants and their still more ancient habitations render it like a place of the fifteenth century. The date of their construction is marked on almost all the houses; some of them have stood for more than five hundred years; they are painted with various colours, and on many of them historical events are represented. The streets are narrow and crooked, and so much is the town obscured by the lofty mountains on every side, that according to an intelligent traveller, the sun is visible in winter for only four hours in the day.^h The inhabitants manufacture cloth, cotton stuffs and muslin.

Altorf, the chief town in the canton of Uri, was rendered illustrious by the liberators of Helvetia. A tower on which

great church (cathedral) was erected in the beginning of the 15th century Simond.—P.

^e "Armes parlantes,"—a coat of arms in which the charges refer to the etymology of the bearer's name.—P.

^b "L'église de Saint Ours"—the church of St. Ursæ. (Ed. Encyc.)

^c Nine miles long and four broad. (Ed. Encyc.)

^d The cathedral was erected in 1421 by the same architect who built the Munster at Strasburg (finished 1439.) Ed. Encyc. Encyc. Method. The

the history of William Tell is represented, stands on the spot formerly occupied by the lime tree, where he aimed at the apple on the head of his son. An old house, now nearly in ruins, is visited by strangers; it belonged to Walter Furst, the father-in-law of William Tell, and one of the heroes of the time.

The simplicity and hospitality of ancient times are still observable in the canton of Underwalden.^a It is divided into two small republics; Stantz, the chief town of the one, is remarkable for a large church, adorned with marble pillars, and Sarnen, the capital of the other, is situated in one of the finest vallies in Switzerland. A large fountain^b formed from a single block of granite has been erected in the market place.^c The people in the canton carry on a considerable trade in cheese, which is exported into Italy and different parts of Germany.

Friburg is one of the most important agricultural cantons in Switzerland; it is also highly interesting to the botanist, and its women are distinguished by their beauty and the singularity of their dress. Cheese forms the principal wealth of Gruyeres, and the small town of Morat is celebrated as being the place of the battle in which Charles the Rash^d was defeated. Friburg, the capital, is encompassed with ancient walls, but the cathedral is the only remarkable building; its tower is about three hundred and ninety feet in height.^e The people appear to be as favourably disposed to antiquated customs and institutions as they are averse to every sort of intellectual improvement. The Jesuits have been lately recalled; they have acquired their former influence, and the direction of the schools is at present committed to their care. The trade of the town consists in hats, cotton cloths and earthen ware.

The canton of Vaud, one of the largest and most populous in Switzerland, is also the one in which the blessings of knowledge and education are most diffused. Crimes are of very rare occurrence; not more than seventy or eighty individuals are confined in all the houses of correction, and out of three thousand processes instituted annually, more than two thousand are settled by the intervention of arbiters or justices of peace.^f

Aventicum, the ancient capital of Roman Helvetia, was situated near the lake of Morat; it occupied an extent of more than six miles^g in circumference. The remains of streets and edifices may still be observed, notwithstanding the ravages of time, and the depredations of ancient and modern barbarians. Ruins which are supposed to have been once public baths, mosaics, pilasters, marble columns, the remains of a vast amphitheatre, basso-relievos and inscriptions attest its former splendour. The walls of its ancient port, and the iron rings to which boats were attached, are still seen; but it is very remarkable that the lake has now receded from it more than a quarter of a league. Tacitus makes mention of *Aventicum*, and Vespasian embellished it, but it is at present an ill peopled burgh, of which the Latin name has been changed into Avenches.* The greatest curiosities in the small town of Payerne, are the tomb and the saddle of queen Bertha; an opening appears in the saddle, which was made to hold the distaff of that good queen, who never travelled without it. Yverdon is a place of trade and industry; its inhabitants are distinguished

by their urbanity and their taste for the sciences. It was the ancient *Ebredunum*, the residence of the commander of the barks (*præfectus barcariorum*.) Orbe, which was also a Roman town, is still commanded by the ancient castle where Brunehault was betrayed and delivered to Clo-taire the Second, by whom she was condemned to death. The small town of Nyon on the lake of Geneva, possesses a considerable trade in porcelain. Rolle is famous for its wine, Morges for its paper, its foils and its cannon, but Vevay is perhaps better known than either, from its romantic situation, and from the rocks of Meillerie,^h that rise above the lake. A large fountain adorns the market place, which may bear a comparison with any other in Switzerland. The vineyards in the neighbourhood are very productive; the husbandmen and vine-dressers join in a festival every four years, which is preceded by a procession, in which different individuals represent heathen gods and personages in sacred history. Noah and Canaan are seen near Bacchus and Silenus; Ceres is seated in her car, followed by bacchantes and satyrs. The origin of the procession, which was in all probability modified after the establishment of Christianity, is lost in the night of time.ⁱ Lausanne, a place of some celebrity, is situated at a short distance from the site of the ancient *Lausonium*; it has several learned and scientific societies; Theodore Beza and Conrad Gessner taught in its academy. The buildings worthy of notice are the castle, the cathedral begun in the year 1000, and consecrated by Gregory the Tenth, in the presence of Rudolph of Hapsburg, and lastly the house inhabited by Gibbon the historian.

The scenery round the lake of Geneva is not perhaps so striking as that near other Swiss lakes of a smaller size. Its surface is supposed to be greater than a hundred and fifty-six square miles;^k but its extent renders it difficult in many places, for the spectator to judge correctly of the distance and height of the summits that encompass it. The mountains seem to be nearer and consequently less elevated than they really are. The upper extremity is without doubt the finest part of the lake; it may there bear a comparison with the most romantic sites in Germany or Switzerland. The surface of its water is eleven hundred and twenty-six feet above the level of the sea.^l The mean depth has been estimated at five hundred and sixty feet, and the temperature is warmer at the surface than at the bottom. The lake is subject to a phenomenon which has not been hitherto satisfactorily explained; in other words, the water has several times been seen to rise four or five feet above its ordinary level in the space of a few hours. To these tides the inhabitants have given the name of *seiches*. It is highly probable that the lake was larger at a former period than at present; indeed the supposition seems to be confirmed by the fact that alluvial deposits are formed at the entrance of the Rhone, while the same river is limpid and transparent at its efflux. This lake, one of the finest in southern Europe, was well known in ancient times by the name of *Leman* (*Lacus Lemanus*.)

Geneva, the capital of a very small Swiss canton, is situated at its western extremity. But although the canton may be insignificant, both in size and population, it is the most civilized, industrious and wealthy of any in Switzer-

^a Underwalden.

land. The houses and buildings in Geneva are little worthy of notice, the streets are narrow, and the town is divided into two unequal parts by the rapid waters of the Rhone; but the natural beauties of the vicinity are varied and imposing. The superiority of Geneva over other places in Switzerland is of an intellectual nature; literature and science have been cultivated with no ordinary success since the Reformation. Much has been done for whatever is connected with education or instruction. Sixty thousand volumes and a great many manuscripts are contained in the library. The college founded by Calvin consists of different chairs in theology, law, medicine and other branches of literature and science. The observatory is provided with good instruments, and the botanical garden abounds with valuable plants; lastly, several literary and scientific societies diffuse among every rank a taste for useful knowledge; to these causes, and to the influence of a rigid worship, may perhaps be attributed the virtue and morality by which the inhabitants of both sexes are distinguished in Geneva.

The valley of the Rhone, which forms the wealthy canton of the Valais, was called in ancient times *Vallis Pennina*, either from the god *Penninus*, or from the Celtic word *pen*, which signifies a *point* or *sharp summit*, a denomination strictly applicable to most of the mountains that surround the valley. The burgh of Saint Maurice, remarkable for its handsome buildings and its fine abbey, is the first place that the stranger enters as he ascends the Rhone. Between it and Martigny, another burgh, part of which has been called the town, is situated the lofty cascade that ought not certainly to be denominated the *Pisse Vache*. It falls from a perpendicular height of three hundred feet, not eight hundred, as some authors have stated. At no great distance above it, on the right bank of the Rhone, Sion, the capital of the canton, and the *Ectodurum*^a of the Romans, exhibits its three castles built one above another. The bishopric of Sion is considered the most ancient in Switzerland. The principal buildings are several convents, an hospital, an episcopal palace and ten churches. The village of Albinen is situated near the baths of Leuk, between Sion and Brieg; it is only accessible, says a traveller, by means of eight long ladders supported on precipitous rocks and steep declivities. The inhabitants, men, women and children, climb up and go down the ladders day and night, many of them with burdens on their heads, without imagining the road to be worse than any other.^b Brieg, one of the finest burghs in the Valais, may be distinguished at a distance by its houses covered with micaceous schistus of a brilliant silver colour; its baths were formerly as much frequented as those at Leuk.

The canton of Tesino is the poorest, and the people are the most ignorant of any in Switzerland. The finest silk in the canton is obtained at Lugano, a small town situated on the banks of a lake. Several buildings in the burgh of Locarno on Lake Maggiore announces its former prosperity. Bellinzona, an insignificant town, is situated on the banks of the Tesino; the gymnasium in the only institution, from which it might be inferred that Bellinzona was the capital of the canton.

If Berne be excepted, the canton of the Grisons is the most important in Switzerland; it formed part of *Rætia* in the time of the Romans. Tisis situated in the midst of mountains, on the branch of the Rhine^c that descends from Mount Bernardino, has been supposed, pro-

bably on account of its name, to have been built by the ancient Tussi or Tuscans, who found shelter in the country when Bellovesus invaded Italy. Although a very small town, it is one of the best built in the canton. Coire on the Plessur, a feeder of the Rhine, is more populous than Tisis; it is the capital of the Grisons, and the ancient *Curia Rhetorum*; its cathedral has stood during ten centuries, but the episcopal palace is a finer building.

The canton of Neuchatel which has already been described in the account of Prussia, forms also a part of the Helvetic confederation. It is the only canton in which monarchial forms of government are modified by republican institutions. Although the rest are not all governed in the same way, all of them are independent, and united to each other by a conservative compact. They may be divided into three classes; the first, or those of Schaffhausen, Zurich, Bale, Soleure, Lucerne and Friburg, are so many mixed aristocratic governments, in other words, several privileged families among the burgesses are called to form part of the small council to which the executive power is committed; the second, or those of Thurgau, Aargau, Saint-Gall, Vaud, Geneva, Valais and Tesino are representative republics, in which the people elect the members of the great council, which deliberates with the executive department or the petty council;^d lastly, the people of Appenzell, Zug, Schweitz, Uri, Glaris and Underwalden live under a democratic government, similar to those of Greece and Rome; the citizens form general assemblies (*Lands-gemeinde*,) in which they nominate their magistrates, and deliberate on the interests of the republic. The important affairs of the confederation are laid before the diet, which is composed of deputies from the twenty-two cantons. The virtue and love of country, so characteristic of the Swiss, are fostered and strengthened by their political institutions; hence the two principal literary and patriotic societies assemble alternately in the different capitals, and bring together the fruits of their labour and research.

Every citizen in Switzerland becomes a soldier at the age of twenty; he must be enrolled in a company, and he must arm and clothe himself according to the uniform of his canton. Each canton, in the event of a war, furnishes a contingent, and all their contingents make up an army of thirty-three thousand seven hundred and fifty-eight men. But Switzerland might easily levy double the number of troops. To provide for the maintenance of the army and other expenses, each canton imposes on itself a tax proportionate to its population and resources. But the amount of the contributions varies according to the revisions which are made of them every twenty years. The debt of the confederation was equal in 1826 to 125,000*l.*, and the revenue to 500,000*l.*^e

The allied powers have recognised by the treaty of Paris, the perpetual neutrality of Switzerland. But fully sensible that the weak ought to place little reliance on the promises of the strong, the Swiss have formed the project of raising works of defence at Saint Maurice, and in some of the defiles in the Valais; it is also intended to fortify a central place where troops may be speedily collected in time of danger.^f The Swiss may find formidable means of resistance in the nature of their territory and in their enthusiasm for liberty; taught by experience, they may avoid the errors which led to the invasion and conquest of their country.

SWISS NEWSPAPERS.

The total number of Newspapers published in Switzerland in 1826, amounted to Twenty-eight. Those that have most circulation are the following:—

GERMAN NEWSPAPERS.

1. Swiss Messenger (Schweizer-Bothe,) published once a week at Aarau.
2. General Correspondent of Switzerland (Allgemein. Schweizerisch. Corresp.,) published twice a week at Schaffhausen.
3. Friday's Gazette (Zürcher Freytags-Zeitung,) at Zurich.
4. New Gazette (Neue Zürcher Zeitung,) thrice a week at Zurich.
5. The Narrator (Erzähler,) once a week at Saint-Gall.
6. The Zug Gazette (Zuger Zeitung,) once a week at Zug.
7. The Friend of the Swiss (Schweizer Freund,) once a week at Berne.

^a According to the statistical tables of Hassel.

^b According to documents in possession of M. Adrian Balbi, in December, 1826.

FRENCH NEWSPAPERS.

8. Lausanne Gazette (Gazette de Lausanne,) twice a week at Lausanne.
9. Vaudois Journal (Nouveliste Vaudois,) twice a week at Lausanne.
10. Journal of Geneva (Journal de Genève,) at Geneva.
11. Bibliothèque Universelle, (a Scientific Journal,) once a month at Geneva.

ITALIAN NEWSPAPERS.

12. Swiss Courier (Corriere Svizzera,) twice a week at Lugano.
13. Tesino Gazette (Gazetta Ticinese,) once a week at Lugano.

Number of Strangers whose Passports were examined at Geneva from the 1st of January to the 30th of November, 1825.

Germans	1,850	Americans	88
Swiss	3,559	Danes and Swedes	45
French	3,058	Russians	116
English	1,539		
Piedmontese and Savoyards	3,094	Total	13,902
Italians	553		

^c The language spoken in the Grisons is the Romansh; in the other cantons in this column, French or Savoyard. See notes (e) and (f) p. 755.

BOOK CXXXI.

EUROPE.

Europe Continued—Italy—First Section—Physical Geography of Italy.

GERMANY is not without interest, from the great events of which it has been the theatre, from the historical associations connected with it, from the advances which have been made in literature and science, and from the genius and character of its inhabitants. It is almost impossible to visit without emotion the picturesque vallies and lofty mountains in Switzerland, the only country in Europe whose inhabitants have preserved the simplicity of patriarchal manners. The azure sky of Italy, its enchanting climate, and matchless pieces of art, render it widely different either from Germany or Switzerland. The stranger hardly arrives at the southern base of the Alps, before he observes new vegetation, new manners and new customs. It seems as if a country favourable to the laurel, the myrtle and the olive, excites man to the love of glory, and renders him better adapted for the advantages of civilization. Italy produced the people that conquered the world; the poets and writers who shed a lustre over it, and the arts introduced by the Greeks, rendered it formerly the most civilized country in Europe; and when barbarism extended its iron sceptre over the same quarter of the earth, even during the period of the crusades, knowledge found an asylum in Italy, from which it was afterwards diffused over the ultramontane countries. Although superstition, monkery and wretchedness have now established their degrading empire in Italy, still it is the fairest portion of Europe.

Considered according to its natural limits, the northern part of Italy comprehends all the southern declivity of the Alps, from the branch called the Cottian to that called the Julian Alps. But these natural limits have been modified by political boundaries. Thus the northern boundary of Italy is comprehended between the gulf of Trieste and the Rhone at its efflux from the lake of Geneva; whence it follows that the Rhone, the Pennine Alps, and the extremity of the Adriatic gulf, separate Italy from France, Switzerland and Germany. The Adriatic gulf and the Mediterranean extend along the coasts of Italy to the declivities of the Maritime Alps near the frontiers of France. The length of the country from north-west to south-east is about seven hundred and fifty miles, its breadth towards the

north about four hundred, in the centre a hundred and twenty-five, in the south a hundred, and at the entrance into Calabria from twenty-five to thirty. The extent of the surface, including Sicily, Sardinia and all the smaller islands, has been estimated at ninety-seven thousand two hundred English square miles; that of the islands only at sixteen thousand eight hundred.^a

The principal mountains in Italy are the Pennine Alps, comprehending the chain that extends from Mount Rosa to Mount Blanc;^b the Græcian Alps between Mount Blanc and Mount Cenis; the Cottian Alps between Mount Cenis and Mount Viso; and lastly, the Maritime Alps which extend from Mount Viso to beyond the Col de Tende.^c These different chains follow an irregular direction from north to south. The long chain of the Appennines stretches from the Tanaro to the extremity of Italy. All these mountains belong to the same system. The Alps, and the Rhetian and Appennine chains, extend from Mount Blanc as from a central mass. The Appennines, which shall be more particularly described, are equal in length to six hundred and seventy miles.^d They are divided into three parts: the northern Appennines extend to the Adriatic gulf, at no great distance to the south of Urbino; the central Appennines terminate near the banks of the Sangro; and the southern Appennines, situated at an equal distance from the two seas, form two branches near Muro: the least important of these branches separates the territory of Bari from that of Otranto; the other, composed of lofty mountains, traverses both the Calabrias and terminates in the Aspromonte.

The chain of the Alps is much more precipitous on the side of Italy, than towards France, Switzerland and Germany; the Appennines are not so lofty, but several branches issue from them, of which the most important form capes on the Mediterranean and the Adriatic gulf. Piombino stands on one of these headlands, but the most remarkable is the one that forms Cape Campanella, at the entrance into the gulf of Naples. The points or extremities of chains are not so numerous on the Adriatic; however, Cape Leuca, at the entrance of the gulf of Taranto, is formed by the last declivities of one of these branches. The principal branch which reaches to the southern extremity of the con-

^a "Length from north-west to south-east, about 300 leagues; breadth in the north more than 160 leagues, in the middle 50, in the south 40, and at the entrance into Calabria only 10 or 12. Superficial extent, including Sicily, Sardinia and the smaller islands, 16,200 sq. leagues; that of the islands only, 2800 square leagues." Length from Monte Rosa to Capo di Leuca, about 670 British miles; medial breadth between the Adriatic and Mediterranean, about 100. (Pinkerton.)—Superficial extent, including Sicily and Sardinia, 117,900 Eng. sq. miles. (Morse.)—P.

^b The Pennine Alps extend eastward to the great St. Gothard, where they join the Helvetic and Rhetian Alps. (Ed. Encyc.) The same extent

is given to the chain in the table of European altitudes, Book XCIV. Of course it includes the Simplon, as well as the entire chain between Mount Rosa and Mount St. Gothard.—P.

^c The Maritime Alps are generally represented as extending to the sea coast between Nice and Oneglia. Saussure also applies the name to the mountains extending along the sea coast, on the one side into Provence, and on the other between Nice and Genoa, which he considers as subdivisions of the principal chain.—P.

^d "270 leagues."

continent, enters the sea and appears again in Sicily. The Appennine chain passes throughout its whole extent nearer the eastern^a than the opposite coast of Italy.

The plains in the same country are not less remarkable than its mountains; that of Lombardy may be considered the finest and most fruitful in Europe, perhaps in the world. Another plain, situated between the gulf of Naples, Vesuvius and the Appennines, is less extensive but almost as fertile as the last. The plains on the other side of the same chain, although smaller, are equally productive; they extend along the shores of the Adriatic, in the territory of Bari, and near the gulf of Manfredonia.

The rivers that water Italy differ from each other in size, according as they descend from the Alps or the Appennines. The Po, the largest of them all, has its source in Mount Viso. Enlarged by the streams of the Tanaro, the Trebia, the Taro and the Panaro, which unite with it on its right bank, and augmented on the left by the Doria, the Orca, the Sesia, the Tesino,^b the Adda and the Oglio, it throws itself, after a course of a hundred and twenty leagues, into the Adriatic gulf. The Tagliamento, the Piave, the Brenta and the Adige rise from the Alps and enter the same gulf. Those that rise from the Appennines, and fall into the Mediterranean, are the Arno, which throws itself into the gulf of Genoa, and the Tiber, which enters the sea near Ostia.

The largest lakes are situated at the base of the Rhatian Alps; such are Lake Maggiore on the west, and to the east of it, those of Lugano, Como, Iseo and Garda, the last of which is the greatest in Italy. When contrasted with these, the lakes of Perugia,^c Bolsena^d and Fucino^e may appear insignificant; they succeed each other in a direction from north-west to south-east on the western declivities of the Appennines.

The fine climate of Italy may have contributed to render its mineral waters as much frequented as those in Germany. The gaseous springs of Saint Julian, the baths of Montecatini, the springs of Saint Cassian, and the celebrated baths of Lucca, attract many strangers to Tuscany. The gaseous springs in the kingdom of Naples are so numerous, that they appear to be connected with volcanic phenomena; it may be sufficient to mention those of Santa Lucia, Pisciarelli, Pozzuoli and the four springs in Ischia. The baths of Albano near Padua, and those of Rocoaro in the neighbourhood of Vicenza, the thermal springs of Acqui, Vinadio and Oleggio in the kingdom of Sardinia, and lastly the mineral waters near Parma, are all frequented by invalids.

The country from the north to the south of Italy may be divided into four different zones, each of them characterized by a peculiar climate. The northern zone, which extends from the Alps to the Appennines, is often exposed to intense cold; Reaumur's thermometer descends sometimes to ten degrees below zero. The olive, the lemon and other fruits of the same kind never flourish. The second zone reaches to the course of the Sangro; the winter is there mild; the olive and the wild orange resist it, but the sweet orange does not succeed in the open air. The Seville orange and the lemon thrive almost without culture in the next region, which terminates near the banks of the Crati. Although frosty

weather is not unknown, it is of rare occurrence in the low grounds. The last zone is exposed to a burning climate; the thermometer never descends below the freezing point; the palm, the aloe and the Indian fig grow on the plains and near the shores of the sea; the highest summits, however, are covered with snow in winter.

Few countries are so fruitful as the first region which occupies all the valley of the Po; it produces a great quantity of rice and different sorts of grain, one of which the Italians use in making their macaroni and other pastry of the same sort. The finest meadows and the fattest cattle in Italy may be seen in the same valley or in others that communicate with it. Cheese forms a considerable branch of exportation; the wines are of a good quality, particularly those of Friuli, the Vicentino, the Bolognese, and Montferrat. The second region does not abound in pasture or corn; the cultivated lands rise in terraces on the declivities of the mountains; their verdure is varied by the pale olive and other fruit trees. As part of the third region is unhealthy, it has been termed the country of the *malaria*; it is covered in many places with rich pastures and numerous flocks. The fig-tree, the almond, the cotton plant, the sugarcane, and the grape that produces the strong wines of Calabria, are cultivated in the last region, and the vegetation resembles that in the finest countries of Africa. The silkworm produces a coarser silk than in the other parts of Italy; the cause has been attributed to the nature of its food, which consists principally of the leaves of the black mulberry tree. The luxuriant branches of the vine twine round the lofty poplar, but it has been remarked that the wines obtained from the low vine, are superior to such as are produced from those which hang in elegant wreaths from the summits of the highest trees. The grapes of the former are often ripe, before those of the latter have begun to change their colour. If the grapes of the two sorts be mingled, the wine becomes acid and disagreeable.

Italy produces all the fruit trees that flourish in the temperate regions of Europe, and some plants which thrive only in high temperatures; such are the date plum (*Diospyrus lotus*), of which the yellow and acid fruits, in size not unlike cherries, are only eaten by children and the poor; the pride of India (*Melia azedarach*), a tree adorned with clusters of pale blue flowers that diffuse a pleasant fragrance; the pomegranate brought from Carthage into Italy by the Romans; the azarole (*Cratægus azarolus*), a sort of medlar tree, producing fruit of a bright red colour, which yields a refreshing juice that the people often drink in southern Italy; the carob tree (*Ceratonia siliqua*); the mastich tree (*Pistacia lentiscus*), of which the oil is used in cookery and for burning; lastly, the round leaved ash (*Fraxinus rotundifolia*), the precious tree of Calabria, that yields the manna of commerce.

Several animals in Italy are common to different parts of Europe; others are peculiar to its climate and its mountains, the last of which serve as a retreat for the lynx, the chamois, the wild goat, the ferret, the dormouse, and the lemming, a small Norwegian rat well known on account of its migrations. The porcupine is found in different parts of the Appennines; there are besides many oxen that the

^a The western, in the original; but this must be a mistake. The Appennine branches from the southern extremity of the Alps, and then stretch along the gulf of Genoa, and eastward to the centre of Italy, whence it extends south-eastward to the southern extremity of the kingdom of Naples, approaching nearer the Adriatic than the Mediterranean.—P.

^b Ticino (*Ticinus*.)

^c *Thrasymenus*.

^d *Lacus Volsiniensis*.

^e Lake Celano, the ancient *Fucinus*.

inhabitants call buffaloes,^a which are tamed in the south of Italy. The Neapolitan horses are strong and well made, the ass and the mule are of an excellent kind, and the sheep may be compared to those in Spain. The birds are very numerous; in the Maritime Alps only, three hundred and six different species have been counted. Some reptiles in the south are common to that region with the northern part of Africa; the most noxious serpents are the asp and the viper.

The Mediterranean abounds with fish and mollusca. The depths of that sea are inhabited by *alpcoccephali*,^b *potomoti* and *lepidolepri*. In the next higher region are found molvi,^c whittings and castagnolli;^d at a thousand feet^e below the surface, the most common fish are rays, anglers (*lophi*), flounders (*pleuronectes*), and others of the same sort.^f The region of corals and madrepores lies at five hundred feet^g below the surface; the fish that frequent it are the file-fish (*balistes*), the wrasse (*labrus*), and the gurnard (*trigla*). Algæ and different sea weeds^h vegetate at a less depth, and that part of the sea is the region of the murænæ, the weavers (*trachini*), and the *stromatei*. The rocks nearer the surface are covered with different sorts of *fuci*, and serve to shelter blennies, trumpet-fish, and all the other kinds that are taken near the shore. Lastly, along the coasts covered with gravel and with sand, are found gilthead, anchovies, mullets, and different mollusca.ⁱ

The cuttle fish is by no means uncommon in the Mediterranean; when in danger, it discharges a black liquor, which has been called *sepia*, and thus conceals itself from its enemies. Another molluscous animal may be mentioned, which has been described by Aristotle and Pliny; it is known by the name of the argonaut or the nautilus.^k That singular animal has a transparent and fragile shell, shaped like a skiff, which has been supposed to have given man the first notion of vessels, and the earliest lessons in navigation. Endowed with intelligence sufficient for its preservation, a provision indispensable for the mariner, as soon as the tempest begins to agitate the billows, it shuts itself in its shell, and descends to the bottom of the waters; but when calm weather returns, it extends its arms out of its light bark, and rises to the surface. It fills its vessel with a quantity of water sufficient for ballast, or empties it at pleasure; it is impelled by its arms, which act as oars, and if the breeze be not too strong, it raises two of them, extends the membrane that unites them, and uses it as a sail for accelerating its course, while another arm descends behind the shell into the water, and acts as a rudder.

The south winds are very disagreeable in the kingdom of Naples and in Sicily, but the south-east wind or the *sirocco* is the most oppressive of any. When it prevails, the light of day is obscured, the leaves of plants are rolled up, as if they had been stung by a destructive insect, and men are exposed to a languor and uneasiness that render them incapable of exertion. It may be considered fortunate that the *sirocco* prevails more in winter than in summer.

Italy affords ample scope for meditation to the geologist.

ⁱ *Histoire naturelle des principales productions de l'Europe méridionale*, par M. Risso, tom. III.

The Alpine limestone commences to the north of Belluno; it is covered with oolitic limestones in horizontal strata, from which red sandstone rises.¹ Springs impregnated with hydrogen issue from the limestone in the valley of Pieva di Cadore. Nineteen mines are situated in the same valley; an ore of lead containing silver is obtained from the mountain of Jiau, which consists also of calcareous rocks; oxide of iron and sulphuret of lead are found in the mountain of Grigni. The geologist observes in the territory of Vicenza calcareous substances analogous to chalk, tertiary deposits and ancient volcanic rocks; in the last are contained globules of chalcedony, filled with air and water. The lava alternates in the heights of Monte-Bolca, with schistous limestone abounding in fossil fish. Green sandstone forms the nucleus of all the calcareous heights that extend through Friuli, and of the low hills of Oltre-Piave. The Veronese exhibits the same arrangements; the limestone rocks are filled with organic remains. At the base of the Appennines, in the duchy of Parma and Piacenza, hills formed of shell limestone rise to the height of sixteen hundred feet; they command the course of the Po, and their strata are inclined from ten to twenty degrees towards the north.

The Po, which traverses a great extent of country similar in its formation to the neighbourhood of Paris, carries along with it, like every great river, an abundant *detritus* from the mountains that encompass it, and from the soil through which it flows. The continual action of its waters accumulates deposits at its mouth, which are every day encroaching on the limits of the sea. It may be proved that, since the year 1604, when it was attempted to confine its banks by dikes, the deposits which the river brings down, have been so much accumulated in the lower part of its course, that the surface of its water is now higher than the tops of the houses in Ferrara.^m The sea has receded since the same period, to the distance of more than three leagues. The ancient *Hadria* or the modern *Adria* was once a famous port, since it gave its name to the Adriatic Gulf; it is now more than eight leagues from the shore. It has been calculated that the annual encroachments made by these deposits amount to four hundred feet,ⁿ but that calculation appears to be overrated;^o it is certain, however, that the labours of men have greatly contributed to augment the deposits. Their progress may be ascertained with sufficient accuracy; in the twelfth century, *Adria* was about thirty, or according to others, thirty-four thousand feet from the sea;^p at the end of the sixteenth century, when a new passage was made for the river, the remotest promontories formed by the deposits were sixty-one thousand six hundred and sixty-five feet^q distant from *Adria*. These distances are believed to be correct, and it follows that the annual extent of the encroachments was equal on an average to eighty-four feet.^r But the successive additions have been much greater since the end of the sixteenth century; if it be recollected that the furthest limits of these alluvial lands are at present 108,334 feet^s from the meridian of *Adria*, it may be shown that they are enlarged every year by

^s "*32,500 metres.*"

more than two hundred and thirty-three feet.^a The Po was formerly subject to inundations, every forty or fifty years; they are now more frequent. The deposits brought down by the Brenta render it not improbable that Venice may share the fate of Adria. The Euganean mountains, a group of volcanic heights, are situated in the vast alluvial plains on the east of the Adige and the town of Este.

Fossil shells are very common in Lombardy and Piedmont, but the beds of earth which cover the marine deposits, abound in many places with the bones of elks, mastodons, elephants, rhinoceroses and other large quadrupeds. The bones of cetaceous animals have been found in the hills near Piaceenza. Animals, which are now extinct, must therefore have inhabited the declivities of the Appennines and Alps before man established his dominion in those regions.

The chain of the Appennines may be divided into two distinct parts; the one is composed of granite, euphotide^b and serpentine, which constitute the nucleus of these mountains; the other is formed of granular^c and compact limestones, above which are silicious strata, and the sandstone known by the name of *macigno*. The granular limestone, which is considered primitive, furnishes very fine white marble for sculpture; the most valuable quarries are those near Carrara on the western declivity of the northern Appennines. But towards the north, these primitive limestones and others of the transition period serve as a support for different tertiary formations, in which are comprehended beds of clay mixed with shells, and other sedimentary deposits containing fragments of wood and the fruits of different coniferous trees.^d The same tertiary formations extend at the base of the central Appennines; they form hills consisting chiefly of argillaceous marl and calcareous and silicious sand, in which are found sulphur, mineral pitch and salt. Organic remains are so abundant that a naturalist believes them to be more numerous than all the animals in the Mediterranean.^e The granitic rocks in the southern Appennines, from the mountains of Conegliano to the extremity of Italy, are more extensive than in the rest of the chain. They are of a yellow colour, and of a granulated and imperfectly crystallized texture; they are apparently of transition formation. Calcareous hills of tertiary formation rise in different directions near the shores of the sea. Saline deposits are situated at the base of the Aspromonte in Eastern Calabria; they are wrought most extensively in the neighbourhood of Lungro.

The existence of a sea, afterwards succeeded by fresh water lakes, along the western declivity of the central Appennines, is attested by the nature of the soil; volcanic products were amassed in the same region at a period anterior to the commencement of history. In one place are *macignos*; in another travertines, the most modern of calcareous rocks. The formation of the latter has been attributed to mineral springs containing carbonic acid; they were used in building most of the monuments of ancient Rome, and they are found in extensive beds in the neighbourhood of that city. Other limestones that are still forming, indicate the course which nature followed in the remotest periods. The waters that descend from the chain of Mount

Velino, hold in suspension carbonate of lime which is deposited in Lake Velino, and also at the falls of Terni and Tivoli. The reader may have some notion of the manner in which this limestone is deposited from the account of an intelligent naturalist. "The celebrated falls of Tivoli are not formed by abrupt declivities in the compact limestone of which these hills, (those that command Rome,) consist, but by deposits from the river that issues from the valley, and which in ancient times was more surcharged with calcareous sediment than at present. The undulating forms that these deposits assume, forms that are not seen in the plains, are owing to the agitation of the waters; their less abundant precipitation may perhaps account for their crystalline texture, by which they differ from travertine, and resemble alabaster. The same arrangement, attributable to the same causes, may be seen in all its details at the lofty falls of Terni. The traveller observes in the neighbourhood, and in the lower parts of the rock, masses of travertine, a fresh water deposit of compact limestone. Near Rieti, at the confluence of the Velino and the Nera, that small river is precipitated over a mass of crystalline concretionary limestone formed in the same way and on the same base of compact limestone as at Tivoli."^f

This limestone is in most places of a brownish red colour; fresh water shells are occasionally found in it; in some places, however, it is of a pure white. On a hill, evidently of recent formation, to the north-west of Radicofani, and near the frontiers of Tuscany, the waters of San Filippo^g to which invalids resort, deposit a very fine white sediment; the water is made to fall into moulds in a very fine spray, and by incrustation bas-reliefs are formed.

The lakes in which the ancient travertine was deposited in the neighbourhood of Rome, have formed the Quirinal, the Aventine, and the Mounts Marius^h and Cœlius; but Janiculum and the rock of the Vatican attest by their mollusca the presence of salt water. Other rocks, and volcanic products conglomerated by calcareous cement, form the soil of the ancient city. Some deposits in the vicinity contain bones belonging to terrestrial animals, of which the species are now extinct.

Two distinct tracts of volcanic matter may be recognized, in the country between the banks of the Po and the extremity of Italy; the one extends along the eastern declivity of the Appennines from the territory of Ferrara to Abruzzo near the banks of the Sangro; the other stretches along the opposite declivity into Sicily. At the two extremities of these volcanic tracts, are exhibited the phenomena of mud volcanoes,ⁱ in which hydrogen gas is the principal agent. The one at Sassuolo, not far from Modena, is visited by all the curious; a piece of wood plunged into that oozy volcano makes the water rise in the form of a jet. Others will be described in the account of Sicily. At the foot of that declivity of the Appennines, which extends towards the Gulf of Naples, craters of different epochs are heaped on the soil now trodden by man, and the fields are fertilized by decomposed lava. All the plain of Campania is covered with volcanic substances, and Naples is built on former currents of lava. According to Spallanzani, the lakes of Averno and Agnano

ⁱ "Salses."

were ancient craters. The Solfatara, the remains of an elliptically formed volcano, at present only emits sulphureous vapours,^a but the cavernous soil resounds under the traveller, and the sulphur and alum which are extracted from it seem to form an exhaustless source of wealth. The Grotto del Cane has lost much of its celebrity, since several volcanic caverns emitting carbonic acid have been discovered in other countries. The Lucrine lake was formerly more extensive, and had a communication with the sea, but the eruption in the month of September, 1538, raised a small volcano in the midst of it, from which burning matter issued during seven days, and the lava forms at present a hill, the Monte Nuovo, four hundred feet in height, and eight thousand in circumference at its base.

Vesuvius rises above all the modern volcanoes in the territory of Naples. As active as it was nearly eighteen hundred years ago, it is considered the only one in Europe, from which different kinds of rocks are thrown unaltered. In the last eruption, which happened in 1822, its height was diminished by more than a hundred feet. The most northern point of its summit is about three thousand eight hundred feet in height. The walls of the crater are formed by successive strata of lava, from which the number of eruptions might almost be calculated. Prismatic lava, almost as regular as the finest basaltic prisms, has several times been observed in the conical cavity. Monte Somma, which was the summit of Vesuvius in the time of Strabo, encompasses part of it at present, and is only separated from it by the volcanic hill of Cantaroni. Near the summit, the lava resounds beneath the feet, and seems about to be swallowed in the gulf it encloses. Hot vapours issue from a great many holes or crevices lined with beautiful efflorescences of sulphur; and if a piece of wood or paper be placed near them, it takes fire in a few seconds. Vesuvius stands isolated in the middle of a plain, and as it is formed by matter thrown from the bowels of the earth, its mass gives the exact measure of the cavity from which the different substances have been ejected. The land round its base is divided into small but very fruitful farms; the richness of the soil formed by the decomposed lava may be inferred from the number of inhabitants in proportion to the surface. Each square league contains five thousand individuals. The stranger may wonder at the security of the population, for apparently men, women and children are threatened with destruction at every instant; but it is well known that every eruption is predicted by certain signs. The earth is shaken, a hollow subterranean noise is heard, the wells and springs are dried up, and the terrified animals wander about the country. Warned of the danger, man has time to escape, and to secure whatever is most precious. Clouds of smoke are emitted from the volcano in the intervals between the eruptions.

The mineral riches of Italy consist rather in earthy than in metallic substances; such are the serpentine on the southern side of the Alps, the porphyry of the Appennines, the marble of Carrara, the alabaster of Volterra, the breccia marble of Stazzema composed of different coloured fragments, the black marble of Pistoia, the green marble of Prato, the brocatello of Piombino, the limestone of Flo-

rence,^b on which are represented ruins and beautiful dendrites formed by molecules of manganese, the sulphated barytes of Mount Paderno, which is transformed by calcination into the paste called Bologna phosphorus, the jaspers of Barga, the chalcedonies of Tuscany, the lapis lazuli near Sienna, the jargon of the Vicentino, the garnet of Piedmont, the hyacinth of Vesuvius, and the mines of Sicily and Sardinia.

Numerous islands form a considerable portion of the Italian territory; the largest are Sicily and Sardinia, we might even add Corsica, for considered physically, it forms a detached portion of the latter. The next in point of extent are Malta, Gozzo, and Pentellaria, to the south of Sicily; then the Lipari or Æolian Islands between Sicily and the continent; Ischia and Capri at the entrance of the Gulf of Naples; and lastly, the island of Elba between Tuscany and Corsica.

Sicily, situated between Europe and Africa, is the largest island in the Mediterranean. Its length from south-east to north-west is about a hundred and fifty-five miles, its mean breadth nearly sixty-two, and its surface nine thousand six hundred and eighty-three square miles.^c A chain of mountains which forms a continuation of the Appennines, divides into three branches, and their three extremities terminate in as many capes, namely, Rasocolmo on the north-east, San Vito on the north-west, and Cape Palo on the south-east. Three great declivities are thus formed in the triangular mass of the island, namely, the northern, eastern, and south-western; many streams and rivers descend from them; the largest are the Belici, the Platani and the Salso on the south, and the Giaretta on the east; the northern declivity is narrow and rapid; no streams of any magnitude rise from it.

The principal rock that forms the nucleus of the Sicilian mountains, according to Spallanzani,^d is a sort of granite that decomposes readily; but from the characters he assigns to it, one might suppose it of a later formation than that of organized beings, and that it was included in the list of sienites, diorites, and protogines.^e It serves as a support for calcareous rocks abounding with madrepores and marinemollusca. Argillaceous schistus and fossil fish have been seen in different parts of the island. The Italian naturalist observed on the sea shore, pudding stones and sandstones in which the pebbles and the grains of sand were united by a calcareous cement, still forming under the water; they are most abundant in the neighbourhood of Messina. Witnesses assured him that they had often found in the sand where these rocks are formed, the heads of arrows, medals and human bones; thus the process of nature may still be discerned in the formation of certain rocks.

Mount Gibello or Ætna, a volcano so immense, that Vesuvius in comparison seems merely a hill, rises on the eastern side of Sicily. It is divided into three vegetable zones, that of the sugar cane, that of the vine and olive, and that of boreal plants. The greatest eruption of late years took place in 1812; it lasted six months: another that happened in 1819, has been described by a traveller who witnessed it, and observed the lava flowing below him; it formed a current of sixty feet in breadth on the mountain, and twelve

hundred at its base. It desolated the country to the distance of two leagues, and set fire to the trees which it touched. The stones discharged from a crater above the opening by which the lava issued, rose apparently to the height of a thousand feet.^a

Several mud volcanoes similar to those near Modena, are situated in the island; among others, there is one at Valanghe della Lalomba, another at Terra Pilata, and a third at Macaluba. The first is the least important; its movements are wholly checked during very hot weather. The second, observed some years ago for the first time by Father La Via, consists of an eminence in which there are several fissures; from a great many small cones, gas and mud rise to the height of six or seven feet; other cones about five feet in depth emit streams of hydrogen. The volcano at Macaluba is somewhat different; it is situated on a little hill about fifty feet in height; its small craters discharge bubbles of gas, which breaking the clay that covers them, produce a noise like that occasioned by a cork bursting from a bottle. A salt spring issues from the little hill, and in the calcareous soil in the neighbourhood are other hillocks of greyish clay, which contain gypsum. Terra Pilata has been so called from its sterility; no vegetable grows on it.

The lands in Sicily are very fruitful; the olive is more vigorous and grows to a greater size than in the rest of Italy; the pistachio tree abounds, and the cotton plant is cultivated with much care; but the forests have been long since exhausted, so that all kinds of timber are at present very rare. Beans are cultivated as a substitute for fallow. The Sicilian honey is of an excellent quality, and the bee is one of the most valuable animals in the country. The animals in general do not differ from those of Calabria; among the birds, the solitary thrush (*Turdus cyanus*) is the one most attached to the soil, and the most admired for its harmonious notes.

It may be worth while to examine a question, concerning which distinguished men have entertained different opinions—was Sicily ever a part of the continent? Those who deny the possibility of such a separation have perhaps paid too little attention to the traditions of the ancients. Pliny^b and Pomponius Mela^c considered it a fact that could not be doubted, and the poets have described the catastrophe.^d The geologist does not attach any weight to a popular tradition, if it be at variance with the principles and truths that form the basis of his science; but if it can be easily reconciled with these principles and truths, it may be considered an additional argument of some importance. It is true that the authority of history is entitled to more credit than a mere tradition, lost in the night of time; but it does not require much reflection to be convinced that at no very remote period history is confounded with fable. The imagination may easily transport itself to the age when men did not possess the art of communicating their ideas by writing, and when history rested only on tradition.

Cluverius^e argues against the possibility of such a separation, because the course of the rivers along the last declivities in Italy, on the side towards Messina, indicate a general inclination of the land towards the sea. But if it be

assumed that the Appennine chain, undermined by subterranean fires, was broken at the place where two heights were separated by a valley, and if, at the time of such a rupture, the waters of the sea rushed violently into the strait of Messina, they must have had some effect in rendering less precipitous, the declivities of Italy on one side, and the capes of Messina and Rasocolmo on the other. This much may be urged in answer to the objections deduced from the actual configuration of the country. But it may be farther objected that it has been ascertained by geological observations, that the mountains in Sicily and the Appennines are formed by the same rocks. If it appears a chimerical notion that a part of the chain, less than a league in length, has been broken by a violent earthquake, because it is an improbable supposition that the southern Appennines are undermined, or, if it may be so said, placed above immense cavities, then it should be recollected that Calabria has been often shaken to its foundations, that a mountain as vast as *Ætna* has been formed by subterranean fires, and that the volcanic heights, now called the Lipari Islands, have been raised from the depths of the waters.

At a league and a half from the Pharos,^f situated on a point near cape Rasocolmo, stands a rock famous in antiquity, as being most dangerous to ships. Rising perpendicularly, the base of Scylla is pierced by many caverns; the billows enter them, mingle with each other, and make in breaking a tremendous noise, which explains why Homer and Virgil have painted Scylla roaring in her cave, and guarded by wolves and fierce dogs. Charybdis, now Calofaro, is about seven hundred and fifty feet distant from the shore at Messina. It no longer resembles the description given of it by Homer; it is not a whirlpool, but a small space hardly a hundred feet in circumference, subject to those eddies which are remarked at sea in all narrow passages.

Malta, Gozzo and Comino are situated between Sicily and Africa; they form a superficies of twenty-two square leagues. Malta is a calcareous rock about five leagues in length and three in breadth,^g covered with a light layer of vegetable mould, which is rendered fruitful by the heat of the climate. More than eighty springs water Malta; but if a proprietor wishes to make a new garden, the soil must be transported from Sicily, a fact that could hardly be inferred from the number and excellent flavour of the Maltese oranges, from its beautiful roses and exhalations of a thousand flowers. The small island of Comino, a rock about five hundred paces in circumference,^h has been so called from the great quantity of cumin which the inhabitants cultivate. Gozzo, an island on which different heights are situated, is about four leagues in length and two in breadth;ⁱ it is fruitful in cotton, grain and vegetables.

Nearer Africa than Sicily, the volcanic island of Pantelaria^k presents on every side steep declivities and caverns. A lake near the centre, about eight hundred paces in circumference, and of an immense depth, fills the cavity of an ancient crater; its waters are tepid, no fish are contained in them. Boiling springs issue from the base of the arid and burnt heights. The part of the island best

adapted for cultivation produces grapes, figs and olives. Lampedosa, nearer Africa than Malta, is little more than two square leagues in extent; it is uninhabited.

The Ægades or the three islands of Favignana, Maretime and Levanzo, near the western coast of Sicily, are little worthy of notice. All the islands on the north of Sicily are ancient craters. Ustica, at eleven leagues from cape Gallo, is crowned by three small volcanic summits, which had been extinguished long before the Phœnician conquest. The soil is a dark loam, yielding rich harvests; the inhabitants cultivate cotton, olives and grapes.

The Lipari or Æolian Islands are situated to the east of Ustica; they are sixteen in number. Basiluzzo and the three Pinarelli are only rocks composed of granitic and porous lavas covered with sulphate of alumine;^a yet three inhabited houses are situated in Basiluzzo. It has been affirmed that hydrogen gas rises round these islands above the surface of the water. The soil of Alicudi or Alicuda is covered with globular lava; but Spallanzani describes a mass of porphyry that did not appear to have been in any way modified by the action of fire.^b Felicuri or Felicudi^c may be remarked on account of its alternate layers of lava and and tufa;^d in the same island is situated a large cavern, called the Grotto of the Sea Ox, not less than two hundred feet in length, one hundred and twenty in breadth, and sixty-five in height. Spallanzani observed there a mass of granite, similar to the rocks near Melazzo in Sicily. The block which seems to have been transported by the waters might tend to strengthen the opinion that a marine irruption has contributed with the action of subterranean fire to separate Sicily from Italy. Salina, which Spallanzani considers the ancient *Didyma*, is more probably the island of *Thermista*. It is about four leagues in circumference; a crater is situated near the centre, and the soil is fruitful in grapes that yield an excellent wine. It has been called Salina from the abundance of salt obtained from a small lake, separated from the sea by a lava dike that the waves have formed. The waters of the lake are diverted into ditches made for the purpose; the heat of the sun dries them by evaporation, and leaves behind thick layers of salt. Lipari, the largest of these islands, is nearly six leagues in circumference; it is covered with feldspathic lava, volcanic glass or obsidian, and pumice stone, with the last of which the inhabitants supply the whole of Europe. The mountain of Campo Bianco consists of conglomerates containing vegetable remains, and forming strata that alternate with pumice stone.^e Two craters are situated in Volcano, an island less than six leagues in circumference; one of them appears to be exhausted; the other, which is of very large dimensions, emits clouds of smoke. It is reckoned to be four thousand six hundred and sixty feet in depth, and two thousand five hundred and sixty-six in diameter.^f The last eruption took place in the year 1775. The extinguished crater is not inaccessible; the stranger may descend to a grotto adorned with stalactites of sulphur. The walls of another grotto are covered with sulphur, sulphate of

alumine and muriate of ammonia. Carbonic acid is disengaged from the hot waters of a small lake in the same island. The volcanic products of Panaria are nowise remarkable; like Lipari, it produces corn, olives, figs and excellent grapes. Stromboli, the most northern of these islands, is a steep volcano, in which a crater open on one side, is always burning. In its ordinary calm state, two eruptions take place every quarter of an hour. Its lavas contain beautiful crystals of specular iron (*oligiste*).^g

The entrance into the Gulf of Naples is defended by three islands, Capri or the ancient *Caprea* on the right, and Ischia and Procida on the left. No traces of volcanoes are to be found in the first, which is about a league and a half long, and a league broad. A calcareous cliff divides it into two parts, and the inhabitants that go from the one to the other must ascend a stair of five hundred steps. It has been inferred from observations made in different parts of the earth, that the waters of the sea are lower than in past ages; Capri, however, offers a proof to the contrary. The floors of the palace^h built by Tiberius are at present covered with the waves. It is said that in certain seasons of the year, quails flock in such numbers to the most fruitful parts of the island, that the quantity caught in a day has been sold for more than a hundred ducats. The tithe that the bishop receives from the quails taken in the island, constitutes his principal revenue. Ischia is eight leagues in circumference; its soil is wholly volcanic; the last marine deposits are at present covered with lava. Strabo informs us,ⁱ that its fruitful harvests and gold mines were the sources of much wealth to the inhabitants; but it is not improbable that the Greek geographer has been mistaken, for no traces of gold can now be found in its lava. Its ancient volcanoes, Monte di Vico and Epopeo, are not much lower than Vesuvius. The eruption which happened in 1302, lasted two months, and compelled the inhabitants to abandon the island; at present, however, it is very populous. It produces good wines, and many strangers repair to it on account of its vapour baths^k and mineral waters. Procida, placed between the continent and the last island, is not more than three leagues in circumference, but it contains a great many inhabitants, more perhaps than any other place of the same size;^l their number is not less than fourteen thousand. Its volcanic soil, formed by successive deposits of lava, yields plenty of oranges, figs, and grapes.

The Pontian islands, of which the five largest are San Stefano, Vandotena, Zannone, Ponza and Palmarola, extend to the west of Ischia; several others of a smaller size, rise between them. Ponza, the largest of the group, is about six or seven miles long, and three or three and a half broad.^m Like those that surround it, it is formed by trachytic rocks, the remains of burning streams that flowed in the midst of earthy volcanic deposits. The base of La Guardia, one of the highest summits in the island, consists of a semi-vitreous trachyte, on which rests a bed of common grey trachyte, about three feet thick. The trachytic rocks in the island of

Zannone rest on limestone belonging to the transition period.

Several other islands are situated towards the north, between Corsica and Tuscany; of these the most southern are Gianuti, formerly *Artemisia*, and Monte Cristo, the ancient *Oglosa*, both of which are inhabited by fishermen, and Giglio, which the Romans called *Ægilium*. In the last are worked granite and valuable marble quarries; its hills are covered with trees, and the soil is fruitful in vines. Pianosa, the ancient *Planasia*, a well wooded but thinly peopled island, lies at no great distance from Elba. Capraia, a small calcareous island to the north of Elba, contains a greater population. Gorgona, opposite to Leghorn, a still smaller island, is covered with wood and serves as a station for the sardel fishermen.

The island of Elba, so famous for its iron mines, which were worked at a very remote period, was called *Æthalia* by the Greeks, and *Iuva* by the Romans. It is from twenty-five to thirty leagues in circumference, and about nineteen in superficies. Granite, micaceous schistus and marble are the principal rocks in its mountains, which extend from east to west. The Capanna is the highest summit in the island. Although some unwholesome marshes might be mentioned, the climate may be said to be salubrious. No river waters the island; Rio is its only stream, but it possesses abundant and never failing springs. Several mineral springs are also situated in Elba; the inhabitants make excellent wine; the pastures, although of small extent, are very fertile.

The island of Sardinia, about sixty-one leagues in length from north to south, and about thirty-three at its greatest breadth, forms a superficies of eleven hundred and ninety-four square leagues. A chain of mountains traverses the island from south to north; two branches extend from its western side, the one towards the north-west and the other towards the south-west. The island is formed principally of granite, in which are contained strata and veins of quartz, sienite and greenstone or diorite, and which is covered in many places, particularly at the two extremities, with micaceous schistus. Mount Genargentu, one of the loftiest in Sardinia, consists chiefly of these substances; it is not less than six thousand and eighty-six feet^a in height. The same rocks appear at the north-eastern extremity, in the mountains of Della Nurra. The southern and northern branches are composed of transition rocks and secondary limestone, and are often covered with trachytes supporting tertiary deposits, on the last of which basalt reposes; this arrangement has been observed in the mountains of Del Marghine, near the middle of the western part of the island. These volcanic masses seem to have been partly overturned and destroyed by aqueous currents flowing in the direction of north to south. Fresh water must have had some share in effecting these catastrophes; for in the country near Cagliari, the remains of carnivorous and ruminating animals, as well as fresh water shells, are found in great numbers.^b No traces are left of the craters from which the aqueous products were discharged. A small modern volcano near Giave, is characterized by puzzolanas and scoria.

^a "1826 metres."

^b "In the neighbourhood of Cagliari there is a formation of osseous breccia, containing the remains of small *rodentia*, the teeth of ruminating animals, and terrestrial shells."

^c Description de l'île de Sardaigne, par M. de la Marmorata, Mémoires du Muséum d'histoire naturelle.

^d Flumendoso.

The existence of gold in the Sardinian mountains may be considered very uncertain, but there are several iron and lead mines. Silver, copper and mercury are found only in small quantities.^c

The principal rivers flow from the western side of the great chain, namely, the Ozieri on the north, the Oristano in the centre, and the Mannu on the south. The Flumendosa^d rises from the opposite side of the mountains. The Oristano is about twenty-two leagues in length; none of the others are more than fifteen. There are numerous small lakes in Sardinia, the waters of which are more or less brackish, a quality derived from the neighbourhood of the sea, or the nature of the soil that they water.

The climate is temperate but often exposed to the fatal effects of a south-east wind called the Levante, the same as the Neapolitan sirocco. Strabo,^f Tacitus,^g Cicero,^h and Cornelius Neposⁱ mention the insalubrity of Sardinia. The same effects are still produced by the same causes; the miasms that rise from the marshes, particularly after hot and rainy weather, occasion dangerous intermittent fevers.

A fifth part of the soil is covered with forests of oak; the principal species are the common oak (*Quercus robur*), the holm (*Quercus ilex*), and the cork tree (*Quercus suber*). The island may be divided into three vegetable zones; that of the mountains may be compared with Corsica; that of the northern plains and coasts resembles Provence and a part of Italy; and lastly, that of the southern plains and coasts is similar to Africa. The low state of agriculture may be attributed rather to the character of the inhabitants than to the nature of the soil.

The largest of the wild animals are the stag, the fallow deer, the goat and the wild boar; but they are all smaller than others of the same species on the continent. The musimon^k differs from the same animal in Corsica, both in size and in the form of the horns, which resemble those of the ram. The other quadrupeds are the fox, the rabbit, the hare and the weazel. The domestic animals are distinguished by peculiar characters; the horses are small but strong, they are often useful for twenty or thirty years; the asses are small and covered with long hair; the oxen, like those in Hungary, have very large horns; they are light, nimble and impetuous. The Sardinian goats are not inferior in size to those in Italy; all the other animals are diminutive and degenerate.

The eagle soars above the mountains, the vulture devours the putrid carcasses in the plains, and the linnet, the black-bird and the thrush enliven the fields. The flamingo arrives from Africa about the middle of August; two months later, it is joined by flocks of swans, geese and wild ducks that have migrated from northern regions, and these are followed by herons, coots and cormorants.

The slow growth of vegetation, and the sudden arefaction of most of the plants, render insects less abundant in Sardinia than in the other countries of southern Europe. The tarantula is not unknown, grasshoppers^l are common, and the gnats are very troublesome. The bees yield excellent honey; in some districts, it has a bitter taste which is not disagreeable; the inhabitants attribute it to the flowers

of the arbut tree. The only reptiles found in the island are a small snake and different species of lizards. Many fish are taken in the rivers and the sea. The most remarkable amphibious animals are two species of seals.

Sardinia is surrounded by several small islands. The largest are San Antioco and San Pietro on the south-west, Asinara on the north-west, and Maddalena, Caprara and Tavolara on the north. San Antioco, the *Enosis* of the Romans, is about nine leagues in circumference. It yields rich harvests, and its inhabitants export a great quantity of

salt. San Pietro, divided into two parts by a hilt, is the ancient *Hieracum*; it is about eight or nine leagues in circumference. The inhabitants fish for coral, work their salt mines,^a and cultivate a fruitful soil. Asinara, the ancient *Insula Herculis*, about four leagues and a half in length and two in breadth, is mountainous and covered with pastures; a few fishermen and shepherds inhabit it. Tavolara, a calcareous rock, now the haunt of wild goats, was frequented by the ancients, who fished on the coasts for the mollusca that yielded the purple die.

BOOK CXXXII.

EUROPE.

Europe Continued.—Description of Italy.—Second Section.—Lombardo-Venetian kingdom.

THE most ancient people that inhabited the country from the sides of the Alps to the banks of the Po, and from the course of the Tesino to the Lisonzo, were the *Orobii* on the north, the *Insubres* and the *Cenomani* below the lakes of Como and Iseo, the *Lavi* on the west, near the confluence of the Tesino and the Po, and the *Euganei* on the east. The *Orobii* were probably aborigines of the Alps; their name signifies literally those that live in the mountains; but Pliny,^a after Cornelius Alexander, makes them the descendants of Greek mountaineers; however, *Bergomum*,^b the name of their capital, indicates a Germanic or rather Germano-Celtic origin. The *Insubres* appear to have also migrated from the north; they were a branch of the *Ombri*, whose name in their language signified *Valiant*. *Mediolanum*, their capital, is the modern Milan. The *Cenomani* were a colony of Celtic people that originally inhabited the territory of Mans; they settled on the southern side of the Alps, six centuries before the vulgar era. The *Lavi* were also considered Gauls. The *Euganei* possessed for a long time the territory that now forms the government of Venice, but they were at last invaded by the *Veneti*, who are supposed to have been a colony of the *Veneti* in the country round Vannes in Armorica, a powerful seafaring and commercial people.

The descendants of these different nations possessed that part of Italy until the fall of the Roman empire in the west, about the end of the fifth century, when the *Heruli*, under the conduct of Odoacer, quitted the banks of the Danube, settled on both sides of the Po, and made Ravenna the capital of their territory. Six years after their conquest, they were subdued by the Ostrogoths, whose power was shaken by the glorious efforts of Belisarius, and overthrown by the eunuch Narses in the year 553.

Italy restored to the emperors of the East, was not long secure against foreign invasions. The *Longobardi*^c quitted the forests of Germany, and founded in 567^d a powerful kingdom in the great valley of the Po, which in time was styled Lombardy. But the bishops of Rome anticipating their power, observed, not without fear and jealousy, the aggrandizement of these barbarians who threatened to destroy or possess the ancient capital of the world. Stephen the Second implored the assistance of France; Pepin took from the *Longobardi* the exarchate of Ravenna, and made the pope sovereign over it. Their kingdom was afterwards destroyed by Charlemagne, who confined Didier,^e their last king, in a convent. Although Lombardy continued with-

out a sovereign, its laws were retained, and after the death of Charlemagne, the country was divided into several principalities subject to the western empire. But the spirit of independence was diffused over that portion of Italy; the emperors of Germany granted to some towns, the right of choosing their magistrates. The citizens had preserved, in accordance with the genius of Christianity, the right of electing their bishops, and this custom led men to conclude that all power emanated from the people.

These and other republican forms determined the inhabitants of the larger towns to demand charters and more important privileges. All the cities in Lombardy during the twelfth century not only elected their magistrates, but deliberated on their local interests, and on questions of peace and war.^f Frederick Barbarossa was the first emperor, who, violating the charters and treaties of his predecessors, attempted to establish absolute power in Italy. Milan was the most important town in Lombardy; besieged by that prince, and reduced to extremity by famine, it consented at last to capitulate, but on conditions which the conqueror disregarded; within a few days after its surrender, Milan was changed into a heap of ruins.^g If the emperor protected the rivals of that large city, he entirely destroyed their freedom, and the magistrates elected by the citizens were succeeded by the *podestas* whom Frederick appointed. The peace which succeeded the noise and confusion of war, was only the stillness of fear. Liberty, although subdued, was not destroyed; the people, unaccustomed to oppression, bore it reluctantly; a secret league conspired to restore their privileges. The towns formed for that purpose a confederation, while Frederick, emboldened by success, marched against Rome, with a view either to humble the Pope, or to unite his possessions to the empire. But on that occasion at least, the thunders of the Vatican were favourable to the independence of nations. The Romans, animated by the just resentment of their bishop, resisted with courage; heaven seemed to favour their efforts, for the plague cut off great numbers in the imperial army. The emperor made new attempts against Lombardy, but denounced and excommunicated, he became the object of hatred and contempt. The confederate towns gave him battle, when his troops were routed and cut to pieces, and Frederick himself saved his life by means of a disguise; at last, abandoned by fortune, he acknowledged the independence of the Lombard republics.

Divisions in opinion are not the least evils in political revolutions; by such causes the inhabitants of the same nation, nay, the citizens of the same town, are often changed

^g In six days, the city of Milan was completely demolished. (Ed. Encyc.)

into irreconcilable enemies. While Barbarossa continued fortunate and victorious, he was surrounded by ambitious flatterers, ever ready to pay their court to the powerful. The same persons adhered to his successor, after the death of Frederick, and, as in the former struggle, the court of Rome had powerfully contributed by its excommunications to the success of the people against the empire, Lombardy was then divided into two dominant factions. The partisans of the Pope took the name of *Guelphs*, while those of the emperor were called *Ghibelines*.^a In their contests, both parties were at different times victorious, but the Guelphs more frequently than the Ghibelines.

The freedom and independence gained by the Lombard towns, tended to promote civilization and the arts, and the diffusion of wealth and commerce. Some notion may be formed of their resources, from the account given of Milan by a cotemporary writer^b in the thirteenth century. It contained among its two hundred thousand inhabitants, six hundred lawyers,^c two hundred physicians, eighty teachers and fifty copyists of manuscripts. Its well paved streets and well built houses, its stone bridges, its public monuments, and its palaces, gave it an appearance wholly different from that of the towns in the north and west of Europe. Its territory, which included Lodi, Pavia, Bergamo and Como, besides a hundred and fifty villages and as many castles, maintained a body of eight thousand knights or gentlemen, and could put two hundred and forty thousand men under arms.

But civil dissensions, the sources of ambition and corruption, proved fatal to the patriotism of the inhabitants, and to their independence. These towns, so determined in defending their privileges against the emperors, chose magistrates whose power became hereditary, and soon degenerated into tyranny. In the fourteenth century, Central Lombardy was the inheritance of the Visconti, while Verona was governed by the family of La Scala, Padua by that of Carrara, and Mantua by that of Gonzaga. Milan and its territory were erected into a duchy, and conferred on one of the Visconti, by the emperor Wenceslaus, in the year 1395. The same principality passed, by right of marriage, to the natural son^d of the celebrated James Sforza, who, from the condition of a labourer, rose by his talents and courage to the dignity of constable. When that family became extinct, Charles the Fifth made himself master of the Milanese, which continued in the possession of Spain until the year 1700, when on the death of the last duke, the house of Austria succeeded to his territory, and ceded some portion of it to Savoy.

The descendants of the Veneti, in order to escape from the barbarous hordes of Alaric, who invaded Italy in the beginning of the fifth century, sought shelter in the small islands at the mouth of the Brenta. They founded there two small towns, Rivoalto^e and Malamocco. So early as the year 697, the magistrates of these populous islands, anxious to secure their independence, and to form a distinct people, obtained from the emperor Leontius, the privilege of electing a chief, on whom they conferred the title of *Doge* or Duke. Pepin, king of Italy, granted to the rising state

certain lands along the coast on both sides of the Adige. Rivoalto was united to the neighbouring islands, and became a new town to which the inhabitants gave the name of *Venetia*. In the ninth century, the republic became important from its commerce and maritime power; in the twelfth it equipped fleets for the crusades. It was principally owing to the efforts of the Venetians that Constantinople was taken in 1202; a part of that city and its territory^f was in consequence added to their dominions; the doges, who had already assumed the title of dukes of Dalmatia, were then styled dukes of three eighths of the Roman empire.^g Candia, the Ionian islands, the most of those in the Archipelago, and other important stations, besides factories at Acre and Alexandria, served to extend the power and the commerce of Venice.

The Venetian government consisted at first of councillors named by the people, who shared with the doge the legislative authority. The latter magistrate possessed originally great prerogatives, but they were gradually restricted lest the dignity should become hereditary.^h A numerous representative council was instituted; it was chosen by twelve electors whom the people appointed; but in time the members that formed it, arrogated the right of naming the twelve electors, and of approving or rejecting their successors before they resigned their functions. The frequent election of the same members resulted as a necessary consequence from this confusion of powers, and a dignity which was intended to be the reward of virtuous citizens, became the exclusive portion of certain families. When these innovations on the primitive form of government were established, a senate was instituted, on which was conferred the right of making peace or war; but the senators, as well as the councillors of the doge, were elected every year by the grand council. The discontent and revolts in the fourteenth century, occasioned by a system that annihilated the fundamental principles of a republican government, led to the formation of the celebrated *Council of Ten*, and in their infernal police were organized the insidious spy, the hired informer and the base assassin.

Such was the state of the duchy of Milan, and the Venetian republic, when in 1796, and again after the victory of Marengo, their territories united with that of Modena and a portion of the States of the Church, formed the Cisalpine republic, afterwards denominated the Italian republic until the year 1805, when it was changed into the kingdom of Italy. The ancient name of Lombardy had been long forgotten, when, by the negotiations at Vienna, Austria having obtained possession of Milan, Mantua, Venice and the Valteline, united their territories, and formed the Lombardo-Venetian kingdom.

This kingdom is bounded on the north by Switzerland and Tyrol, on the west and the south by the Sardinian possessions, the duchies of Parma and Modena, and the States of the Church, and on the east by the Adriatic Gulf and the kingdom of Illyria. It is equal in superficial extent to about two thousand three hundred and sixty-eight square leagues.ⁱ Lake Maggiore, the Tesino and the greater part of the Po are its natural limits.

^a The Guelphs derived their name from an illustrious Bavarian family, allied by marriage with the house of Este. The Ghibelines were so called from a village in Franconia, the birthplace of Conrad the Salic, from whom the house of Suabia was descended. See Hallam's Middle Ages; Gibbon's Antiquities of the house of Brunswick.

^h M. Thielen considers it equal to 851.94 German square miles. [18,290 Eng. sq. miles. Morse.]

Winter lasts generally about two months; the fields are clothed with verdure in February, and the heat of summer is felt in May. The grain and the ordinary kinds of fruit are ripe in June or July, and the vintage takes place in October. The air is salubrious in most parts of the kingdom, but the rice fields occasion in some places putrid miasms; the environs of Mantua and Rovigo are exposed to unwholesome exhalations, and the lagoons are dangerous to strangers.

The valley of the Po, which in the time of Polybius was a marshy country shaded by forests, the haunt of wild boars, does not at present furnish a sufficient quantity of wood for its inhabitants. The treasures of Ceres and Pomona have succeeded to the peaceful retreats of the hamadryads. Extensive meadows watered by the streams that descend from the Alps, yield six crops of hay in the same year. The horned cattle are not inferior to any in Europe; the peasants devote much attention to them; cheese and the produce of the dairy are their principal wealth.

Some customs of past times still exist in the Milanese; heavy wagons with low and massive wheels, drawn by several pairs of oxen, the tips of their long horns covered with iron balls, and their heads adorned with ribbons and garlands, the country women with their hair folded in tresses and fastened together by a silver bodkin, the shepherds carrying instead of a crook, a staff in the form of a crosier, and with a mantle hanging from their left shoulder, and the arched heads of the sheep, their pendant ears and light forms, similar to many ancient basso-relievos, announce Italy and its classic associations. These and other characters which the stranger observes on his arrival, form a striking contrast with the wretchedness of the peasantry, but he becomes habituated to other contrasts, still more painful, for Italy is the country of luxury and poverty.

The bee and the silk-worm are reared with great success in Lombardy; an enormous quantity of wax is consumed in the churches, and the manufacturing of silk is among the few branches of industry, in which the people are not inferior to their neighbours. However, cotton spinning, and cloth and linen manufactures, are not without activity, and it has been estimated that the mean product of the exports amounts to about £3,542,000. Commercial communications are facilitated by excellent roads, rivers and canals.

The Lombardo-Venetian kingdom has been declared an integral part of the Austrian empire. As the country was long governed by French laws, absolute power has been mitigated by the constitution of 1815. The forms of national representation have been established, but the members that compose it, have only the right of deliberating on certain questions, which the government proposes. The emperor is represented by a viceroy, and the kingdom is divided into two governments, those of Milan and Venice. The first is subdivided into nine districts or *delegations*, and the second into eight.

Milan, the capital of the kingdom, and the residence of the viceroy, is situated in a vast plain on the banks of the Olona. If its old ramparts and new walks be included, it will be equal in circumference to ten thousand yards, but

the part which is inhabited does not exceed six thousand.^a Eleven gates lead to different parts of the country, and the greatest length of Milan, or the space between the eastern and Tesino gates, is about three thousand yards.^b The number of houses is not less than four thousand eight hundred, and the population amounts to a hundred and forty thousand inhabitants. If the streets in Milan were more generally broad and straight, it would merit the title of *the Magnificent*. It has been justly remarked, that mean looking houses are as rare as palaces in other towns. The most spacious streets are called *corsi*, both because they serve the purpose of public walks, and because they are the places where race horses run. The squares or courts are almost all irregular and without ornament; that of the *Duomo* or cathedral is long and narrow.

The cathedral itself, one of the most remarkable in Europe, was begun in the year 1386, by duke John Galeazzo Visconti; but a long time may elapse before it be finished. If little was done towards completing the cathedral, with the two millions of francs which Napoleon granted for that purpose, it is not likely that much can be effected in a short period with the hundred and forty-four thousand francs paid annually by Austria. The building is about four hundred and fifty-four feet in length and two hundred and seventy in breadth, and the arched roof^c is two hundred and thirty-two feet in height.^d The top of the highest turret is not less than three hundred and thirty-five feet above the ground.^e Few Gothic buildings are so much loaded with ornaments; white marble statues appear in every niche, at every angle, on every turret, and round every spire; their total number has been estimated at more than four thousand, but many of them are so concealed as to be only seen by the birds which perch on them. Fifty-two marble pillars, each eighty-four feet in height and twenty-four in circumference, support the vast edifice. In a subterranean chapel, below the cathedral, are deposited, in a silver shrine, the remains of St. Charles Borromeo.

The church of St. Ambrose^f contains the tombs of several saints,^g and also of Bernard, king of Italy, and his wife Bertha. It was in the same church that the emperors of Germany received the iron crown. The ancient convent of the Dominicans is celebrated for the famous painting of Leonardo da Vinci, representing the Last Supper, not a fresco but an oil painting on the wall of the refectory, and occupying a whole side of that low hall, in other words, about thirty feet in length by fifteen in height. But it has been so much disfigured by time, smoke, and damp, that it is to be feared no trace of it will be discernible in a short period. It could hardly be believed that the municipal authorities at Milan, had changed the refectory into a watch-house, nay, even into a prison, where French soldiers guarded their prisoners of war. If the authorities were so regardless of a painting which had been the greatest ornament in their city for more than three hundred years,^h it is not wonderful that French soldiers used it as a target. "As to those by whom the mischief was done," says Simond, "an old woman who had lived near the refectory for the last seventeen years informed me, that she had heard of soldiers firing at the picture before she resided there, that a

soldier of the sixth French hussars told her, he himself with others had done so, not knowing what it was, when guarding prisoners confined in the hall, and that these prisoners, men of all nations, threw stones and brickbats against it by way of amusement. When Buonaparte came to Milan he went to see the picture, and finding the hall still used as a place of confinement, *he shrugged his shoulders and stamped with his foot*, said the woman, and ordering the prisoners away, a door was walled up, and a ballustrade or wooden partition was drawn across the room before it.^a The church of St. Alexander is remarkable for its fine portal; that of San Vittore is so much overloaded with gilt ornaments that it resembles rather a gaudy play-house than a temple intended for devotion.

Several authors^b have exhausted their etymological ingenuity in discovering the origin of *Mediolanum*, the ancient name of the town. It was not so called from two Tuscan warriors, nor from its position between two rivers, nor from a pig^c half covered with wool (*medio lana*), which was seen by Bellovesus at the place where he founded the city, for it is certain that other towns inhabited by the Gauls, bore the same name. Several antiquities prove that Milan was in its splendour while the Roman empire flourished. Sixteen marble columns may still be seen near the church of San Lorenzo; they are supposed to be the remains of the baths built by Maximian Hercules, the associate of Diocletian in the empire.

The principal public buildings in Milan are the archiepiscopal palace, adorned with fine paintings, the royal palace, that of the regency, the Marini palace, now occupied by the minister of finance, the palace or court of justice, and the mint, a building in point of architecture unworthy of Milan, but remarkable for its fine collection of medals and Italian coins. The barracks which were built at Milan by Eugene Beauharnois, when viceroy of Italy, are admitted to be the finest in Europe. Twelve or fourteen palaces of elegant architecture, and richly decorated, belong to different individuals, and evince the opulence of some Milanese families.

The two most frequented of the four or five theatres in Milan, are the opera, and the theatre of Girolamo. The first or the Scala, so called because it occupies the site of an ancient church of the same name, is a very large building. The six rows of boxes give it an imposing appearance; but small rooms are attached to them; the spectators seldom listen to the music; conversation and gambling are considered more attractive; indeed it is often impossible to hear the performance from the noise that prevails in every part of the house. A reading room is open in the Scala from mid-day to the evening, and in the evening, numbers repair to different gaming tables. Thus, the purpose of the Scala has been perverted, and it might be better that it were closed, than that the young should come in contact with gamblers and the profligate persons who frequent it.

The Girolamo is considered the best theatre of puppets or marionets in Italy. The precision and vivacity in the

motions of the actors produce a complete illusion. The origin of these small wooden figures can only be discovered in vague traditions of a very ancient period. An intrepid French traveller^d has recently brought from Egypt small wooden figures, moveable by springs, and not inferior to those of Nuremberg. It appears that the Egyptians interred these playthings with their children, a custom which existed at Rome after the introduction of Christianity. In ancient times, a young woman before her marriage, sacrificed to Venus the doll that had been given to her in childhood.^e Ancient authors make mention of small moveable figures, that attracted crowds in the streets;^f but as Millin observes, the moderns were the first who substituted puppets for actors in their theatres. The person that contributed most to improve and perfect these exhibitions was Philip Acciajuoli, a knight of Malta. Tragedies, operas, comedies and ballets are represented in the Girolamo. Crowds of all classes resort to them; the humble shop-keeper, the wealthy banker and the haughty noble are equally delighted with the humorous tricks (*lazzi*) of Girolamo, a burlesque personage corresponding to the *Polichinello* of Naples, the *Arlequino* of Venice, and the *Gianduja* of Turin.

The immense esplanade that encompasses the remains of the ancient castle of Milan, was little better than an unwholesome marsh which the French transformed into an agreeable walk, shaded by more than ten thousand trees; it was then known by the name of *Foro Buonaparte*.^g A triumphal arch adorned with basso-relievos in white marble, was erected during the French government^h at the end of the road that leads across the Simplon. At no great distance from the triumphal arch, stands the circus, also a monument of the reign of Napoleon, and one from its size not unlike the monuments of the Romans. The seats which are raised above each other might contain thirty thousand spectators, and the arena is set apart for races and public games. The Corso near the eastern gate is lined with fine houses,ⁱ and the rows of trees that extend between the same gate and the Roman gate, are often crowded with fashionable equipages; it is here that the Milanese display their address in driving their light phaetons.

Our limits prevent us from describing the Ambrosian library, founded by a cardinal Borromeo,^k and that of Brera in the royal palace of the sciences and arts,^l an elegant building to which are attached a fine observatory and a botanical garden containing many exotic plants. The same reason prevents us from mentioning the numerous hospitals and charitable institutions; but it may be remarked that the application of Jenner's happy discovery, to whom the ancients would have erected temples, is more diffused in the Lombardo-Venetian kingdom than in the rest of Italy. If few ravages are now made by the small-pox in Milan, it is owing to the vigilance of government, and to the enlightened zeal of the clergy. Sworn vaccinators are always ready to impede its effects; the managers of hospitals and other charities grant no assistance to children unless their parents be furnished with certificates of

vaccination. Every three months, the country curates read from the pulpit, the names of the individuals, if there be any, who have died of the small-pox. They remind their parishioners of the duty they owe to their country, which commands them not to neglect the means of security.^a If an individual be seized with the small-pox, and if his physician or one of his relations does not declare it, they are liable to a penalty of a hundred francs. The authorities fix an inscription in large characters on his house, and contagion is thus prevented. The members of the family who may have approached the invalid are not permitted to communicate with others, before he be cured; and if he dies, the body is interred without the usual ceremonies.

Milan has always held a distinguished rank in literature and in the arts. Virgil studied, and Valerius Maximus was born in the town. It has produced in modern times, Octavio Ferrari, the antiquary, Cardan, the mathematician, and Beccaria, the celebrated jurist. The same town carries on a considerable trade, and possesses many manufactories.

Monza, at some leagues to the north of Milan, is adorned with a fine palace and a cathedral, the last of which possesses a richer treasury than any other in the kingdom. One may see there the famous iron crown of which the date and origin are unknown. The population of the same town amounts hardly to six thousand persons. It existed in the time of the Romans, and was then called *Modilia* or *Modovtia*. Its agreeable position on the banks of the Lambro, made Theodoric, king of the Goths, choose it for a residence.

Pavia rises on the banks of the Tesino, on the southern frontier of the kingdom; it was formerly called *Ticinum* from the name of the river.^b It was a place of some importance under the emperors, and according to Pliny,^c it was more ancient than Milan. Tacitus also mentions it;^d indeed few towns in Italy are so pleasantly situated. The Lombards chose it for their capital, but antiquaries are unable to explain the origin of its name. It was laid waste by Marshal Lautrec, who, by a new species of barbarism, sought to avenge the defeat of Francis the First. Pavia is surrounded with massive walls, half ruined towers, bastions and ditches; the number of inhabitants exceeds twenty-two thousand.^e The streets are broad, and the great square is encompassed with porticos. The finely built cathedral indicates the period of the regeneration of art. A long piece of wood, not unlike the old mast of a boat, is preserved with great care in the cathedral, and shown to strangers, as the lance of Orlando. Of the other eighteen churches, St. Peter's is most worthy of notice for its Lombard architecture; the people pretend that the ashes of St. Augustin rest in its vaults. The town possesses a theatre and several fine buildings; its university dates from the time of Charlemagne.

Lodi possesses a fine square encompassed with arcades, eight suburbs, eighteen thousand inhabitants, an old citadel, now useless, lofty walls, twenty churches, a large hospital, a theatre, several palaces belonging to different individuals, porcelain works, silk manufactories, and, lastly, a considerable trade in cheese, which is called Parmesan. It is situated on the banks of the Adda, and is celebrated on

account of the victory gained by the French on the 10th of May 1796.

Como is about eight leagues to the north of Milan; it rises on the southern extremity of a lake to which it gives its name. It could hardly be inferred from its narrow and tortuous streets that it was a royal town; it claims, however, a greater honour, that of having been the birthplace of Pliny the younger. Although the architecture of the marble cathedral is partly Gothic and partly modern, it is the only building worthy of notice in the town. The lake of Como is the *Larius* of the ancients. Beyond the romantic banks of the lake, the picturesque valley of the Adda, or the Valteline, extends along the base of the Alps. That valley, once a part of Switzerland, and afterwards of France, has been united under the Austrian empire to the Lombardo-Venetian kingdom. Sondrio, the chief town, does not contain more than three thousand five hundred inhabitants.

Beyond the chain which bounds the valley on the south, and between two small rivers, the Brembo and the Serio, is situated Bergamo, a royal town, the *Bergomum* of the Romans. It was pillaged and destroyed by Attila, rebuilt by the Lombards, and made a free town by the successors of Charlemagne. While Venice was in its splendour, Bergamo was added to the territory of the republic. It carries on a considerable trade in iron and in silk; the inhabitants are industrious and comparatively affluent.

The ancient town of Cremona is situated in a beautiful plain, and is encompassed with ditches, walls and bastions, and commanded by the citadel of Santa Croce; it is watered by the Po, and by a canal which extends from that river, and communicates with the Oglio. It was founded by the *Cenomani* a Celtic people who called it *Cremon*, from which its present name has been derived. Faithful to the cause of Brutus, its territory was divided among the soldiers of Augustus. It was sacked by the troops of Vespasian, and afterwards pillaged by the Goths in the year 630. It experienced the same treatment from the emperor Barbarossa. Marshal Villeroy was taken prisoner at Cremona by the Austrians in 1702; and in 1799 the latter gained some advantage over the French, under its walls. The town holds a great reputation in Italy and in most parts of Europe for its musical instruments, particularly its violins. It occupies a considerable extent of ground, not less than two leagues in circumference;^f its population amounts to twenty-three thousand five hundred inhabitants. The streets are broad, straight and well built; the palaces are large, but they are all Gothic buildings. The Duomo or cathedral, the most remarkable of its forty-five churches, is surmounted by a tower which rises to the height of three hundred and seventy-two feet, and is supposed to be higher than any other in Italy. As Cremona is long and narrow, it has been compared to a vessel, of which the tower is the mast.^g

Brescia, at ten leagues to the north of Cremona, is also surrounded with ramparts and ditches; most of its streets are broad and regular, and it contains thirty-two thousand inhabitants. The palace of justice is worthy of notice for its mixture of Gothic and modern architecture; the interior is adorned with fresco paintings. The episcopal palace is

a magnificent building; the theatre, which has been lately finished, is remarkable for its elegant peristyle, and the cathedral for its bold arches, and its paintings, statues and rich altars. The town possesses an extensive commerce, and its fire arms are considered the best in Italy.

Mantua, says Millin, recalls many associations; it was the birthplace of Virgil, and it is connected with the glory and liberality of the Gonzagas. Enclosed by immense marshes, formed by the inundations of the Mincio, it has the appearance of an impregnable town; but these marshes are unwholesome, and occasion dangerous diseases, neither do they form an impassable barrier, for Mantua has been more than once taken; many consider it, however, one of the strongest towns in Italy,^a and it is believed to have been built by the Etruscans three centuries before the foundation of Rome.^b It contained fifty thousand inhabitants at the close of the seventeenth century, but its present population amounts hardly to half the number.^c The streets are broad, and most of them straight; the squares are large and regular; the fortifications are kept in good repair. The town boasts of having given birth to Virgil, and the inhabitants take care to remind strangers of that circumstance; his bust is seen on one of the eight gates, and a monument in honour of the poet rises in the principal square—the Piazza di Virgilio.^d The cathedral was built after the designs of Julio Romano, but as a piece of architecture, it cannot be compared with the palace of Te, a very fine building, so called from its resemblance to the letter T. The ashes of Tasso, the modern Virgil, rest in the church of St. Egida. The Austrian government has been at considerable expense in rendering Mantua more salubrious, by draining part of its marshes, and by constructing new fortifications and demolishing the old, by which a passage has been opened for the stagnant waters. Although silk, cloth and leather are made in the town, its commerce is only carried on through the medium of the Jews.

All the towns that have been as yet described, belong to the government of Milan; before we give an account of those under the government of Venice, some remarks may be made on the insalubrity of certain districts in Upper Italy. We have already had occasion to allude to the poverty and wretchedness of the inhabitants in some of the Milanese villages. At the base of the mountains, which form the northern limits of the country, the villagers are exposed to a disease which has been termed *pellagra*, and which, according to physicians, was unknown a century ago. It is a cutaneous affection, and the external characters are brown or blackish spots, that appear on every part of the body except the face. Those that are afflicted with it, says Dr. Valentin,^e are emaciated, weak and melancholy, oppressed by hypochondria, and tormented with pains that extend along the vertebral column. In some cases the same disease is accompanied with alarming symptoms of delirium. The *pellagra* is often fatal, and in many instances it has excited its victims to commit suicide; it breaks out in the spring, increases with the heat of summer, and terminates at the approach of winter. The cause of the disease has not yet been ascertained, but it may probably be attributed to a scanty and unwholesome diet; at all

events it is very uncommon in the government of Venice, a country, in point of climate, much more unhealthy than the Milanese. The effects of the climate begin to be apparent near the banks of the Adige, and according to some statements, the neighbourhood of Peschiera, near the lake of Garda, is so dangerous to strangers, that French regiments used to decide by lot, which of them should form the garrison of the town.^f The story, it may be admitted, does not appear very probable, as it is not customary for soldiers to choose the place of their garrison. Travellers affirm that the territory of Verona is equally unhealthy; it is certain that the ravages of poverty and disease are but too apparent in the town of Rovigo.

The old walls of Verona are commanded on the north by hills covered with vineyards and country houses. The Adige divides it into two equal parts; it is about four leagues in circumference, and the population is equal to sixty thousand inhabitants. Different opinions are entertained concerning its origin, but it is known that it was an important place in the time of Strabo. The fine gates that adorn it, are worthy of a great city, but the interior corresponds ill with the entrance; for although some of the streets are spacious and well paved, the greater number are small and narrow. The townhouse contains several good paintings of the Venetian school, and the museum a valuable collection of antiquities. The venerable remains of its ancient splendour may be still seen near these modern collections; the amphitheatre, the most remarkable of any, and still in a good state of preservation, rises at no great distance from them. It is difficult to observe its ancient monuments without recollecting that Verona was the birthplace of the elder Pliny and Cornelius Nepos. Those who admire the paintings in its churches, will soon be reminded that the modern Verona was the native town of Paul Veronese.

The fruitfulness of the soil in the neighbourhood of Padua, Vicenza, Treviso, and Belluno, forms a remarkable contrast with the poverty of the inhabitants. Indolence and want of education are the principal causes; immorality and every sort of vice, the fatal effects: it is not safe to travel at night in Upper Italy; although the robbers in that part of the country are less formidable than at Terracina or Fondi, strangers are as liable to have their luggage and effects stolen. The remote villages are so many dens of thieves; those who travel from Verona to Venice, never think of passing the night at any other place than Vicenza or Padua.^g The last mentioned town is of a triangular form; it occupies a space of more than three leagues in circumference,^h and contains a population of forty-seven thousand inhabitants. The antiquity of Padua is not doubtful; what is said concerning it by Livy,ⁱ who was born within its walls, and the beautiful verses of Virgil,^k who attributes its foundation to Antenor, prove that it existed twelve centuries before the Christian era. It was called *Patavium* by the ancients, and according to Strabo,^l who extols its commerce and its wealth, it could raise long before his time an army of a hundred and twenty thousand men. The Greek geographer may be supposed to have exaggerated, or more probably, some error may have crept into his text, but different Roman poets attest the prosperity and the wealth of Padua.^m

^m "The prosperous state of its manufactures, particularly of woollens."

ⁿ Martial. Epig. Lib. xiv.—Juvenal. Sat. viii.

It is at present adorned with several spacious squares and many fine buildings, but most of the streets are narrow, dirty and ill paved, and bordered with low and gloomy arcades. At Padua, as in every other Italian town, there are many paintings in the churches, and the paintings as well as the churches are the works of great masters. The number of the churches is not less than ninety-six, and it is said that the church of St. Anthony contains the remains of its patron. The village of Arqua, at some leagues to the south-west of Padua,^a is not only remarkable for its picturesque site, but it also contains the tomb of Petrarch, and the house inhabited by the poet, in which part of his furniture has been preserved.

Vicenza, the ancient *Vicentia*, is peopled by thirty thousand inhabitants, and encompassed with a double wall. The streets are irregular, but in point of architecture and fine buildings, it may be compared with any town in Upper Italy. Few antiquities are contained within its walls; some ruins of a theatre, which is supposed to have been built by Augustus, the remains of an imperial palace, and a statue of Iphigenia, preserved by the Dominicans, are all that have escaped the ravages of time, and the devastations of barbarians. Vicenza was the birthplace of the celebrated architect Palladio, who embellished his native city.

The streets of Treviso are not more regular than those of Vicenza; most of the squares are large and surrounded with arcades; the townhouse is a fine building, and the cathedral possesses several valuable ornaments. The population is equal to fifteen thousand souls. Although Belluno is a royal town,^b it contains only eight thousand inhabitants. Udina, another royal town, and the metropolis of Friuli, is built on the canal of Roya. A large guardhouse, one of the principal edifices, is adorned with marble statues and columns. The *Giardino*, a fine public walk, shaded with trees that were planted by the French, is situated in front of the castle.

The lagoons (It. *lagune*) extend along the coasts of the Adriatic Gulf, and their stagnant waters diffuse an unwholesome atmosphere over the scattered habitations that surround them. The sickly and pallid faces of the inhabitants are remarked by the strangers that visit the country. The lagoons are soon confounded with the sea, and Venice is seen rising from the ocean, the element of its former wealth and power. Venice, one of the oldest and most singular towns in Europe, stands on a hundred and fifty islands in the midst of a vast marsh; they are united by more than three hundred bridges, and appear to form only a single island. It is equal to nearly three leagues in circumference; a large canal divides it into two equal parts, and other canals lined with houses, form the streets, in which the monotonous sound of oars may be heard instead of the noise of carriages. The groups of houses that rise between the canals, are divided by narrow streets or lanes for foot passengers. Venice, notwithstanding its position, is not subject to the unwholesome influence of the marshes; the continual motion of the waves agitates and purifies the air. No springs rise from the sandy soil; some cisterns belonging to private individuals, and a hundred and sixty public cisterns, furnish water to its hundred and ten thousand inhabitants. The lagoons and canals of Venice are its chief security; ships of war cannot attack it, and before the French expedition which took place in 1797, it had never been entered by a hostile army.

The church of St. Mark, one of its principal edifices, is by no means the finest or largest in Venice, but it is the most remarkable for its rich and costly ornaments; it has been said, and not without reason, that it resembles nothing else in the world. The broad and low front is divided into five arcades, not unlike the arches of a bridge, and the entrances are formed by five gates of bronze. Above these arcades, a gallery or balcony with a marble balustrade, stretches across the whole front, and in the same gallery are placed the four bronze horses, supposed to have been cast at Corinth. They were removed to Athens; they served to adorn the triumphal arches raised to Nero and Trajan at Rome; they accompanied Constantine to Byzantium, and were transported from Constantinople to Venice in the thirteenth century; lastly, under the imperial government, they were placed in the Carrousel at Paris, from whence they were returned to their present position in 1815. The Parisians deplored their loss, but the day of their arrival was a day of joy to the Venetians; one might almost have imagined that they had recovered their independence with these monuments of their ancient greatness; yet a few days afterwards, when the statue of Napoleon was overthrown, the same people expressed their dissatisfaction. The church of St. Mark is one of the earliest monuments of the middle ages; its foundation dates from the commencement of the tenth century. The upper part of the building is covered with pyramids, statues, spires and crosses; the interior is gloomy and loaded with columns, statues and gildings; the great altar, or that of St. Sophia, was brought from Constantinople with the bronze horses.

The square of St. Mark, the finest in Venice, may bear a comparison with any other in Europe. It is about eight hundred feet long by three hundred and fifty broad; but it ought not to be judged by its dimensions; when seen from the sea, it has a magnificent appearance. Two columns formed by two single blocks of granite, rise near the quay; they were brought from Constantinople, but they appear to be of Egyptian workmanship; one of them supports the statue of St. Theodore, and the other, the winged lion of St. Mark, which, during several years, was the ornament of the Invalids at Paris. The massive architecture of the ducal palace on the right, has something of the Moorish style. The royal palace, a modern edifice on the left, is adorned with arcades and columns. These, together with the church of St. Mark, the mint, the library and several fine buildings, the works of the architect Sansovino, form the enclosure of St. Mark's, the scene of the Venetian festivals, and the place where strangers and the idle citizens assemble. The finest shops and the most frequented coffee-houses in Venice are situated under the arcades of the same square.

The part nearest the quay is called the *Piazzetta* or little square, and at no great distance, is the palace once destined for the sovereign; but little attention is paid to decorum, for from its windows may be seen the place where criminals are executed; the instruments of death are erected between two pillars near the street where buffoons and puppets amuse the Venetians. The ancient residence of the doge, or the ducal palace, where the state inquisitors used to sit, and which, like the seraglio at Constantinople, has been more than once stained with the heads of the victims, that were exposed on the outer balustrade, may prove that an aristocracy armed with republican laws, can be as sanguinary as a despotism armed with the Ottoman scimitar

^a 4 leagues S. W. of Padua, Vosgien.

^b Chief town of a delegation.

مسجد جامع
باصطخر

اصطخر

It requires a day to examine the interior of the edifice: colossal statues are placed on the staircase; the galleries are adorned with the masterpieces of Titian, Tintoretto, Paul Veronese, Corregio and Alberti; and the library consists of a hundred and fifty thousand volumes and a thousand manuscripts. Not the least valuable ornaments are several ancient statues of admirable workmanship.

Strangers admire the fine portal of St. Mary of Nazareth, the front of St. Jeremiah, which resembles a palace rather than a church, the peristyle of St. Simon, and the noble architecture of St. Roche. Almost all the theatres are called after some saint; St. Luke's is one of the largest; operas are acted in St. Benedict's; tragedies, comedies, and other dramatic compositions in St. Angelo; but the finest theatre in Venice, or that of St. Felix, was finished in 1793. Protected by these venerable names, the actors are not exposed to the same unjust prejudices which exist in other catholic countries.

The arsenal, including the dock-yards of Venice, formerly the most celebrated and the largest in Europe, was once filled with ships, materials for building, and all kinds of arms; the outer wall measures between two and three miles^a in circumference, and within these walls, during the republic, two thousand five hundred workmen were constantly employed; stillness and repose have now succeeded the noise and activity of commerce. Two white marble lions placed at the entrance of the arsenal towards the town, were also a conquest of the Venetians; they were transported from Athens. The port of Venice, although at present the most considerable in the Austrian empire, may in time be blocked up with the deposits of sand that are every day accumulating.

One may judge of what Venice has been by the number of its edifices and charitable institutions; thirty-six Catholic churches, two Greek churches, an Armenian church and a Lutheran chapel, seven synagogues, a foundling hospital, two lazarettos, and twenty-three hospitals, serve to recal its past splendour, and render its decay more apparent.

The artisans form at Venice several corporations, and each corporation maintains a school; the number of corporations amounts to sixteen or eighteen, and some of them meet in sumptuous buildings adorned with paintings and statues. It might be inferred from such institutions that the Venetians were better informed and more enlightened than any other people. Such, however, is by no means the case; they can only be said to be less ignorant than the other Italians.

The *gondolieri* are different from the other inhabitants;

they form a distinct population, and the cause may be attributed to the fraternity or union which subsists amongst them; but they are no longer gay sailors singing Venetian airs, or reciting the verses of Tasso; they have discovered in their simplicity that they are without a country. All these men can read and write, and the other workmen in the town can do the same; but the knowledge of the wealthier classes is not much more extensive.

The public libraries are ill attended, and the others^b are made up of novels and romances, so that with the exception of a few gifted persons, the rest are not better educated than the lower orders in the town that gave birth to Algarotti, Gasparo Gozzi, Goldoni, Fra Paolo, Bembo, and other great men. The Venetians have no taste for literature; music, however, appears to be a favourite amusement. According to their own confession, the wealthy classes pass their time in the following manner. "People of fashion rise at eleven or twelve o'clock, pay a few visits, and idle away their time till three, when they dine; they lie down in summer during one hour, at least, after dinner; they dress and go to the coffee-house or *casino* till nine, then to the opera, which is another *casino*, then to the coffee-house for an hour or two. They do not go to bed in summer before sunrise. Many of the most saving dine at the restaurateurs, and the price of their dinner varies from sixteen sous to two francs, or from eightpence to twentypence English money."^c Although there is a wide difference between the past and present state of Venice, it is still one of the greatest marts in Italy. It has its fabrics and manufactures, a chamber and a tribunal of commerce, an exchange and an insurance company. The last doges celebrated in the island of Malamocco, their marriage with the Adriatic, but Venice could hardly then be called a maritime power.

A town was built near the ancient queen of the Adriatic, on the island of Torcello, and its ruins announce that it was once an important city. The remains of a church enriched with mosaics and paintings, the ruins of a palace, once the residence of a barbarian conqueror, a marketplace and a throne raised above it, where Attila, king of the Huns, administered justice, still attract the curious to the island; the town itself has disappeared.

Reduced to the state of a chief town in an Austrian province, what power can prevent the ruin of Venice? Those who saw it forty years ago, can no longer recognise it; such changes have taken place in the capital, which had its navy in the sixth century, which protected Petrarch and encouraged the arts, when Europe was in the darkness of barbarism, and which during nine hundred years, was treated on equal terms with the greatest sovereigns.

BOOK CXXXIII.

EUROPE.

Europe Continued—Description of Italy—Third Section—Sardinian Monarchy—Principality of Monaco.

THE kingdom of Sardinia consists of the island of the same name, divided into two provinces, and of eight divisions or intendancies, made up of forty small provinces, on the continent. The extent of the latter, from north to south, is about eighty-eight leagues, and the breadth about forty-six, forming a superficies of nearly two thousand three hundred square leagues.^a They are bounded on the north by the lake of Geneva and Switzerland, on the east by the Lombardo-Venetian kingdom, and the duchies of Parma and Massa, on the south by the Mediterranean, and on the west by France.

The southern shores of Lake Lemman were inhabited by the *Nantuates*, a long time before the Christian era. The banks of the Doria were peopled by the *Salassi*, concerning whom Strabo has left us some particulars.^b According to that geographer, the greater part of their territory was situated in a deep valley—the valley of Aosta; he adds, that they were in possession of gold mines, but it appears more probable that they obtained the metal from washings in the alluvial lands, for he affirms that the *Duria*, the present Doria, supplied them with water for carrying on their works, but as by this means the river was often dried, it gave rise to violent contentions between them and their neighbours, who used the water for agricultural purposes. They made war and peace more than once with the Romans, but in their combats, their defiles and mountains were more serviceable to them than their armies. They were bold enough to impose a tax of a drachma on every soldier in the army of Decius Brutus, whilst he fled from Modena; and they made Messala pay for the firewood and trees necessary for his troops encamped in the neighbourhood. They pillaged on one occasion the imperial treasury, and under the pretext of working at the roads and bridges, they rolled large stones and rocks on the Roman legions. The revolts of the *Salassi* exasperated the Romans, and they were destroyed by Augustus; forty thousand were sold as slaves, and four thousand were incorporated in the prætorian guard. Three thousand Romans sent by Augustus, founded the town of *Augusta*,^c in the very place where Varro their conqueror had encamped with his army. The same town has given its name to the valley of Aosta.^d

The *Taurini* inhabited the country between the Alps, the Po, and the Doria; like the *Salassi* they were of Celtic

origin. The *Statielli*, concerning whom little is known, inhabited the right bank of the Tanaro; but the country on the west, at the foot of the Alps, belonged to a people that were called by the ancients, the *Vagienni*, *Vageni* or *Bageni*.^e The territory of the *Intemelii*, an inconsiderable tribe, extended from the southern side of the Alps to the sea. Lastly, the *Apuani* who derived their name from the town of *Apua*, the present Pontremoli, were settled on the southern side of the Appennines, in the country between Genoa and Spezia. The territories of the four last people made up the Roman province of *Liguria*; the others were included in the two Gauls.^f

The country near Lake Lemman was called Savoy (*Saupaudia*,^g) about the fifth century. It was governed at different times by Burgundian, French and Provençal princes;^h the emperor Conrad the Salic, erected it into a county, and made it over to Count Humbert. Different domains were successively added to it, and in the fifteenth century, it received the title of duchy from the emperor Sigismund.

The house of Savoy ranks among the oldest in Europe. But as its origin is involved in darkness, it is not surprising that genealogists have traced it to Witikind. That Saxon chief may be considered the Japhet of the princes in modern Europe; all claim him for their founder. The house of Savoy, sprung only from Humbert, who reigned in the eleventh century, might prove an antiquity of eight hundred years. Victor Amadeus the Second was the founder of the Sardinian kingdom; wearied with the cares of a throne, he abdicated in 1730 in favour of his son Charles Emmanuel, whose ingratitude brought his father to the grave. The reign of Charles Emmanuel was glorious, but in consequence of the influence which the French acquired from their conquests, his successors lost all their continental possessions, and the kingdom of Sardinia, confined within the limits of the island, did not recover its former rank, before the last treaties by which its continental possessions were restored.

The Sardinian language is not pure Italian; many Latin, Castilian, Greek, French and even German words are contained in it; that mixed language is most diffused in the island of Sardinia. Two very different dialects are spoken on the continent; the Savoyard, which according to M. Balbi,ⁱ offers many varieties, and the Vaudois which is spoken in Piedmont, particularly in the province of Pignerol.

ⁱ Atlas ethnographique du globe.

The country is divided into twenty bishoprics and six archbishoprics; the Catholic is the established religion; all the rest are merely tolerated. Twenty-two thousand Vaudois,^a residing in the vallies of the Alps, who for at least twelve centuries have professed a worship analogous to the reformed religion, bear in silence the privation of their privileges as citizens. They are excluded from the learned professions; all the scientific or literary situations in the different colleges are shut against them; although a brave and a warlike people, they can never rise in the army. The Jews, still more unfortunate, cannot hold landed property, and have been obliged to give up the possessions which they had acquired under the French government. Confined in the towns, they are only permitted to exercise their industry in particular quarters, and are besides compelled to wear a badge by which they may be known. From these facts relative to the Protestants and the Jews, it may be easy to judge of the spirit that animates the Sardinian government, and the discontent that prevails among the different classes of a people, who were dissatisfied, and not without some cause, under the French government, but who have since been deprived of the advantages which they then enjoyed, without obtaining any redress for their grievances.

When the king of Sardinia was restored to his dominions, the congress at Vienna recommended, relatively to Genoa, something like a liberal government, or at all events the exclusion of an oppressive one. The French civil and commercial codes were retained, but they have been since so far changed that the records of births and marriages are restored to the clergy, and the ancient mode of hereditary succession is at present in full force.^b The penal code and the codes of civil and criminal procedure were set aside, and the old barbarous jurisprudence of Piedmont, (the torture excepted,) is at present the law of the land.

When the united sovereigns of Europe gave new territories to his Sardinian majesty, they stipulated that no new taxes should be raised without the consent of the people, made known by the assemblies in each district; yet new taxes have been levied, and these assemblies have never met. In short, the will of the king is the only law on which the rights and liberties of the people depend. He disposes of their effects by taxes, and of their persons by arbitrary imprisonment. The very attempt to emigrate without leave, is an offence corrigible by fine, confiscation, and even ignominious punishment. The judges appointed and revocable at pleasure, determine the costs of a suit, and as their salaries are very moderate, they do not administer, but sell justice. The prerogative of mercy, the brightest jewel in the crown, is subject to a tax, which has been denominated the *royal emolument*. As the sentence of a judge, says M. Simond, in civil as well as in criminal cases is sometimes set aside arbitrarily, so are private contracts between individuals, however legal, and testaments made in due form. An individual secretly accused may be taken up and kept in a dungeon for years, even for his whole life, without trial. When tried, it is in secret; he is not present at the examination of witnesses, he does not even know who they are; and, finally, the judges decide from the report made by one of them, (the *juge d'instruction*,) assisted by the recorder's clerk. There are no instances of an acquitted prisoner

being liberated without paying costs.^d As if it were not enough that the nobles in the county of Nice, in Piedmont and in Savoy, had recovered with other feudal rights, that of administering justice, the governors of provinces, in the plenitude of their authority, inflict corporal punishment on those under their jurisdiction, and sentence the people to remain hours, nay days, in the stocks. What more could be done at Constantinople?

The towns in the dutchy of Savoy are not important. Chamberry is more agreeable from its position, than remarkable for its buildings. Saint Jean de Maurienne, a small place, although the chief town in the province of Mariana or Maurienne, consists of ill built houses and dirty streets. The country in the neighbourhood of these two towns is picturesque, fruitful, and well cultivated; lofty mulberry trees, scattered in every direction, indicate that the inhabitants derive a great profit from their silk worms.

The stranger has hardly crossed the Arc, which descends from the Græcian Alps, before he observes the excellent road over Mount Cenis, by which he can now travel in a carriage across mountains, that at no very remote period were ascended by means of chairmen and mules. The *ramasse* is no longer used in descending from the highest point on the road to Lanslebourg; a journey of five miles can no longer be made in seven minutes; the traveller need not commit himself to the skill of a guide, whose feet acted as a helm in directing the light *ramasse* along the snow, and which by one false movement might be precipitated into an abyss. Another and less rapid declivity has been cut, and that part of the journey may be performed without danger. But the road over Mount Cenis cannot be compared with that across the Simplon.

In ascending the Doria, the traveller perceives a passage cut through the rocks, between Bard and Aosta, the magnificent work of the dukes of Savoy; farther to the north, at Aosta, may be seen the remains of Roman buildings, and a triumphal arch erected to Augustus. Beyond Mount Rosa, the admiration which was before attracted by the beauties of nature, is concentrated on one of the noblest monuments of human patience and industry. The road across the Simplon surpasses the greatest works of the Romans; it was not only necessary to blow up the rocks with gunpowder, but to excavate numerous galleries, in order to open a road through the mountains practicable for every sort of carriage. Hannibal and Bernard, the uncle of Charlemagne, had crossed the Alps before Napoleon, but a long period may elapse before any conqueror shall imitate him in the great undertaking by which Switzerland is forever united to Italy.

Lake Maggiore forms the limit of the Sardinian possessions; the road which descends from the Simplon, winds along it, and traverses the old and pleasant town of Novara, situated to the south of Oleggio, a place frequented by strangers for its mineral waters. Vercelli is interesting from its antiquities; a manuscript gospel of Saint Mark, written in the fourth century, is preserved in the cathedral. The Cimbri were cut to pieces by Marius in the plains near Vercelli.

Turin (It. *Torino*) is situated at the extremity of the plains of Lombardy, not far from the junction of the Po and the Doria, the latter a small river that has been some-

^a Waldenses.

^b "The sons inherit to the exclusion of the daughters."

^c "Provincial councils."

^d Simond's Travels in Italy.

times confounded with the one that waters the valley of Aosta.^a Turin is a very ancient capital; it was the principal city of the *Taurini*, as its name indicates. It consists of two parts, the old and the new; the one resembles any other ancient and Gothic town; the other has all the elegance of modern cities. But its broad and straight streets are dismal and deserted; they are only animated during festivals. Two large squares separate the old from the new town; the latter is perhaps cleaner than any other in Italy, an advantage which is secured by a great number of fountains that water and purify the streets in summer, and clear them of snow in winter. In order to effect the latter operation, the reservoir at the gate of Susa is opened for two hours, and a torrent rushes from it that carries away the snow and every sort of filth from the town.

A street, a mile^b in length, formed, like all the others in the new town, by houses built after the same model, and adorned with porticos, that afford shelter from the rain and the heat of the sun, leads to the royal castle. The palace is situated in the centre of a square, and surrounded by a moat; it is a sort of *Hermes* in architecture, exhibiting on one side a Gothic front, and on the other, the elegance of Grecian architecture.^c The staircase that leads to the interior of the building is finer than any in Italy, surpassing those at Caserta and in the *Palazzo Reale* at Naples. The number of churches and chapels at Turin amounts to a hundred and ten; the most admired of any is the church of San Lorenzo; the interior is covered with black marble, and several chains hanging down from the ceiling, formerly sustained lamps and candelabras of massive silver, which were taken away by the French; but the same people respected the *santo sudario* or winding sheet of our Saviour, an object of popular veneration. It is supposed to be a true relic, although Genoa possesses another, which is considered equally genuine. The great theatre^d at Turin was for a long time the finest in Italy; it served as a model for the one at Naples. The university is another building, not inferior in its kind to any in Turin; the entrance to it is formed by a large square court encompassed with arcades, and the walls are adorned with basso-relievos and ancient inscriptions.

Coni, although peopled by seventeen thousand inhabitants, contains little worthy of notice; it is situated on the banks of the Stura, to the south of Turin. It was formerly a place of great strength, but was dismantled by the French after the battle of Marengo. Casal, situated on the Po to the east of Turin, is not more interesting than the preceding; it contains an equal number of inhabitants, but its public buildings are more numerous. The fine road which leads to Genoa, passes through Asti, formerly celebrated in the country for its hundred towers, as Thebes was in ancient times for its hundred gates. But its old walls are now falling in ruins, and its population is rapidly decreasing; although in superficial extent, nearly equal to Turin, it does not contain more than twenty-two thousand souls. The inconsiderable trade of Asti is confined to white and red wines, which are said to be better than any others

in Piedmont. Alba Pompeia,^e at some leagues to the south-west of Asti, was embellished by the father of the great Pompey; it is known too as the birthplace of the emperor Pertinax. The road from Asti follows the windings of the Tanaro, and leads to Alexandria. When seen at a distance, Alexandria (It. *Alessandria*) resembles a village in the midst of a plain. Although a gloomy town, consisting of brick houses, it is one of the strongest places in Italy. It owes its origin to the quarrels between the popes and the emperors in the twelfth century; it was founded in honour of Alexander the Third, and bore for a long time the name of *Alessandria della paglia*, because its houses were at first covered with straw. A road extends to the north-east from Alexandria, and leads to Tortona and Voghera. The first, formerly a large and populous town, has now only eight thousand inhabitants; the second contains ten thousand, and is adorned with a fine cathedral of Grecian architecture.

The country assumes a new aspect at the division of the roads to Tortona and Genoa, or at the entrance into the Appennines; the road to the latter winds through a narrow passage, at one place shaded with forests, at another lined with solitary meadows; the habitations of men become gradually more rare, and at last disappear before the stranger reaches the defile of the Bocchetta. On passing the defile, Genoa appears at the base of the mountains, and the Mediterranean is lost in the horizon. It often happens that the Mediterranean is confounded with the mists which cover the country; but in fine weather, its surface, as brilliant as crystal, assumes the azure tint of the sky.

Genoa may be seen to the greatest advantage from the sea; it rises in the form of a semicircle more than three thousand six hundred yards in length;^f two gigantic moles defend the entrance of the port; at one extremity, on the point of a rock, rises a lighthouse of stupendous proportions. The town is encompassed in a circuit of eight miles,^g with a double range of fortifications, that are celebrated from the siege that Massena sustained against the Austrians in 1800, and from the courageous resistance of the inhabitants, who endured for a period of fifty-nine days all the privations of famine. The interior of the town consists of very steep and narrow streets between lofty palaces: many of them are covered in the middle with a brick causeway two or three feet wide, for the convenience of mules and porters, for carts cannot ascend them. Two streets, Balbi and the New Street,^h are accessible to carriages; on both sides of the former are the most magnificent palaces in Genoa. The flat roofs are adorned with shrubs and trees, among which are orange trees twenty-five feet high, rising from a bed of earth several feet deep, conveyed to the roofs, and supported on arches; fountains play among these artificial groves, and keep up their verdure and shade during the heat of summer. The finest edifices are the palaces belonging to the families of Durazzo, Spinola, Doria, Brignole and Serra, the ancient ducal palace and some churches and convents. Among the latter, the church of Santa Maria di Carignano is a building of elegant architecture, and although the inside of

the Annunziata is loaded with gilt ornaments, the stranger may regret that its front is still unfinished. The church of San Cyro is adorned with fresco paintings, and the Gothic cathedral is covered on the inside and outside with marble of different colours. There are besides three well built hospitals; one of them, the *Albergo dei Poveri* is a model in its kind; it affords the means of subsistence to fifteen hundred individuals of every age, and the young are instructed in different trades. The theatres in Genoa cannot be compared with others in many parts of Italy. The only public walks are the walls of the port, the alleys of *Acqua Verde*, and the fine bridge of *Carignano*, which is not less than a hundred feet in height; it rises above houses of six stories, and unites two elevated parts of the town.

The exchange where the noble merchants of Genoa formerly assembled to carry on their mighty trade, has lost much of its activity, although Genoa has been declared a free port; still the appearance of decay is less obvious than at Venice. Genoa was so powerful from its commerce in the time of the Carthaginians, that it excited the jealousy of that people, by whom it was reduced to ashes. Rebuilt by the Romans, it repaired the losses which it sustained at a later period by the invasions of the Huns, the Goths and the Heruli, and afterwards by the conquests of the Lombards and of Charlemagne. The famous bank of *St. George*, the earliest in any commercial town, was established at Genoa in the twelfth century.^a The rival of Venice in the thirteenth century, it possessed *Pera*, a suburb of Constantinople. Having become the capital of a powerful republic, it preserved longer than Venice the primitive form of its government, and although repeatedly forced to implore foreign protection against civil commotions, the love of independence was always the cause of its glory and success. It was from convenience, not from compulsion, that it ceded *Corsica* to *Lewis the Fifteenth*. It retained its independence till 1798, when, under the name of the *Ligurian republic*, it received a constitution from republican France; but under the empire, Genoa and its territory were changed into a department. It is difficult to recal these recollections, and not to regret that at the time when so many states claimed and obtained their independence, Genoa was not restored to its ancient freedom.

The lower orders in Genoa are civil and obliging; the nobles, unlike those of *Turin*, are neither distinguished by powdered wigs, gold-headed canes, and a proportionable degree of pomp and solemnity, nor by that sort of etiquette which prevailed in France before the revolution; on the contrary, they are remarkable for the frankness and simplicity of their manners, advantages which must, without doubt, be attributed to their commercial pursuits. The women wear the *mezzaro*, a long white veil, half covering the face, and gracefully thrown round the person; it descends nearly to the feet, but does not conceal light shoes and white silk stockings. All the women in the upper classes have their *cavalieri serventi*, a custom considered scandalous in other countries, but so common in Genoa, that it is adopted by many persons who are irreproachable on the score of morals. The love of the arts, the culture of the

mind, and a certain freedom of opinion, distinguish the Genoese from the southern Italians. The inhabitants long accustomed to commerce, still excel in some departments of industry. Genoa has its silk, velvet, and gold lace manufactories; its jewels, perfumes and artificial flowers are so many articles of exportation. As to the products of the soil, the oils of Genoa are more valuable than its wines.

The eastern coast of the gulf of Genoa has been long called the *Riviera del Levante*.^b *Spezia*, the principal port on that coast, contains six thousand inhabitants. *Savona* on the opposite coast or the *Riviera del Ponente*,^c is twice as populous; it possesses a considerable trade in potash and in the produce of its earthen and porcelain works, but its commerce might be much increased, if the harbour, which is now useless, was rebuilt.^d The town of *Nice*, situated on the same coast, the capital of a province and a bishopric, possesses a finer climate than any other in Italy; the winters are not accompanied with frost, and many strangers, particularly English, are attracted to it by the mildness of its temperature.

The small town of *Monaco*, at two leagues to the east of *Nice*, is peopled by eleven hundred inhabitants. It stands on a rock which braves the fury of the billows, and on the site of an ancient temple erected to *Hercules Monœcus*;^e its territory, which has been styled a principality since the tenth century, is governed by the family of *Grimaldi*, under the protection of his Sardinian majesty.

The island of *Sardinia*, or according to its Greek name, *Sardon*, belonged to the Carthaginians at the period of their first war with the Romans, by whom they were expelled from the island, which became one of the *Roman granaries*; not long afterwards *Corsica* and *Sardinia* formed a single province. While governed by the masters of the world, its population was greater than at present; it then contained forty-two towns, but not more than ten which merit the name, can now be enumerated. The Vandals having made themselves masters of Spain and the coasts of Africa, took possession of *Sardinia* in the seventh century. The Pisans and the Genoese succeeded them in the eleventh; two hundred years afterwards, the popes, who seldom neglected an opportunity of adding to their temporal dominions, endeavoured to unite the island to the territories of the church, and the Pisans were twice constrained to submit. *James the Second*, king of *Arragon*, made himself master of *Sardinia* in the fourteenth century, and it continued under the government of Spain until the year 1708, when the English took possession of it in the name of the emperor of Germany, who gave it up to the duke of *Savoy*, in exchange for *Sicily*.

The Sardinians remained in a state of barbarism after the middle ages, but comparatively at a late period, and under the paternal government of *Savoy*, they have been made to participate in the light of knowledge, and in the benefits of civilization. The arts and sciences are now flourishing, and the house of *Savoy* cannot be ignorant that the present prosperity and improved condition of the inhabitants, are the result of their wise and enlightened measures. The misfortunes of the reigning family have per-

^a The Bank of *St. George* was first regularly incorporated in 1107. Previous to that time, the republic borrowed large sums of money from the citizens, assigning certain branches of the revenue for the payment of interest; and a Board of Management was appointed to conduct the loans, pay the interest and account to government for the funds entrusted to their care. From this circumstance, the Genoese claim the merit of establishing a bank as early as the Venetians. The Bank of *Venice*, the first re-

gularly incorporated bank, was established about the middle of the twelfth century. (Ed. Encyc.)—P.

^b Eastern Shore.

^c Western Shore.

^d "If the harbour, which has long been filled up, was cleared." It was partly filled up by the Genoese, in order to transfer its commerce to Genoa.—P.

^e *Virgil. Æneid. Lib. vi. v. 830.*

haps contributed to produce these good effects; the conquests of the French deprived them of their other possessions, and the progress of improvement was most rapid when the princes resided in the island.

The inhabitants had for a long time little intercourse with the other Italians; they may still be distinguished from them. The Sardinian is strong, lively, and courageous even to rashness; of quick passions, he is ardent in his affections, and violent in his hatred. Fond of the marvellous from his habits or state of civilization, endowed with a vivid imagination, and prone to enthusiasm, these qualities account for his devotion to poetry and the fine arts.

Cagliari, the capital, stands on the declivity of a steep hill, at the bottom of a gulf on the southern side of the island; a strong castle built by the Pisans rises above it. The population amounts to twenty-eight thousand inhabitants; it is the residence of the viceroy and the principal authorities. The houses are ill built and the streets are narrow and crooked. The palace of the viceroy is the only building worthy of notice; among the others are a cathedral, thirty-eight churches, twenty-one convents, a university, a college for nobles, a mint and a theatre. Among the useful

institutions may be mentioned schools of medicine and mathematics, a library, museums of antiquities and natural history, and different hospitals. The town was founded by the Carthaginians, and still carries on a considerable commerce; the products of its territory are corn, oil, wine, cotton, and indigo. Sassari, the town next to it in importance, is situated in a fine valley on the northwest of the island, and contains fifteen thousand inhabitants. Oristano, a town near the gulf of the same name on the western coast, contains six thousand inhabitants; it carries on a great trade in tunny, a fish which abounds in that part of the Mediterranean. Bosa, a small port at the mouth of the Terno, on the same side of the island, possesses an ancient cathedral and several convents; the walls which encompassed the town, are now in ruins; it is peopled by five thousand souls. Alghero,^a on the same coast, carries on a greater trade in corn than any other place in Sardinia. The population amounts to seven thousand inhabitants; its port cannot admit large vessels, but the spacious and fortified harbour of Porto-Conte, at two miles^b to the east, might contain several fleets.

^a Algheri.

^b "A league."

BOOK CXXXIV.

EUROPE.

Europe Continued.—Description of Italy.—Fourth Section.

—*Dutchies of Parma, Modena, Massa and Lucca.—Grand Dutchy of Tuscany.—Republic of San Marino.*

THE country which forms the subject of the present and of the following book, is divided into a greater number of small states than any other part of Italy. Seven independent states occupy a surface of three thousand nine hundred and seventy square leagues, and, without including the Roman territory, they are the most important from the wealth and industry of their inhabitants.

In ancient times these states comprehended Southern Cisalpine Gaul, Etruria, Umbria, Picenum, and Latium. The *Anamani*, a people of uncertain origin, but who were probably Celtic, inhabited almost all the territory in the dutchy of Parma; their limits were the Po on the north, the Trebia on the west, and the Parma on the east. The *Lingones* to the south of the Po, and the *Boii* on the northern declivities of the Appennines, the latter a tribe of the same origin as the people that have been mentioned in the account of Bohemia, were settled in the territories of Modena, Bologna, and Ferrara. The western declivities of the Appennines in Etruria, were peopled by the *Magelli* and the *Ligures*, tribes that in their customs resembled the Gauls. On the shores of the Adriatic, the *Senones*, a tribe of the Gauls, settled in the country near the present republic of San Marino, about four centuries before the Christian era. They were celebrated for the part they took in the expedition of the Gauls against Rome, in which they were defeated by Camillus. The *Piceni*^a inhabited the declivities of the Appennines, which form the present territories of Ancona, Macerata and Ascoli; they were Sabines by origin. Their country was called *Picenum* from the great quantity of mineral pitch which it contained. *Umbria*, situated on the western side of the Appennines, between the Tiber and the Nera, a feeder of the same river, was inhabited by a people sprung from the Gauls. According to Count de Gebelin, the Sabines,^b their neighbours, derived their name from the Celtic word *sab*, which signifies high or elevated; they occupied indeed the declivities and summits of the Appennines. Ancient writers mention the Sabines in the most favourable terms; they were frank, generous and valiant; their women were modest and virtuous; their marriages, says Mentelle, were civil obligations, entered into in the name of the state; a very extraordinary fact, as in ancient times, religious ceremonies were the bases of social contracts. The power of the Sabines is

proved by the early history of Rome; the *Hernici*, the *Lucani*, the *Samnites* and the *Brutii* were colonies of the same people. Before their country was conquered by the Romans, their simple and metaphysical worship was exempt from the corruption which characterized polytheism. The territory between the mouth of the Tiber and that of the Tolerio or the ancient *Liris*,^c was called *Latium*; it extended eastward to the lake *Lucrino*.^d The inhabitants, or the *Latini*, were the descendants of Pelasgians that migrated from Thessaly, and of another people concerning whose origin so little was known, that they were termed *Aborigines*.^e

When Charlemagne carried his victorious arms into Italy, he made himself master of Parma and Placentia; but it is not proved that he gave them to the Holy Sec, and it is equally uncertain that Parma derives its name from the *parma* or round buckler worn by the *Anamani*. But whether it was the effect of policy or of the influence which knowledge and religion gave the popes over ignorant and superstitious princes, Rome continued long in possession of these two towns. They became republics at a later period; but civil divisions and the quarrels between the Guelphs and Ghibelines were the means of transferring them successively to the Corregios, the Scaligers, the Viscontis, the Sforzas and the popes. When Julius the Second, one of the most intriguing pontiffs, had formed the great league of kings against France in 1512, he made himself be invested in the possession of Parma and Placentia by the emperor Maximilian. Paul the Third made them over in 1547 to his son Lewis Farnese, who was assassinated two years afterwards, but his descendants enjoyed them until Elizabeth Farnese, the heiress of the family, married Philip the Fifth, king of Spain, and brought these two dutchies as her dowry to the house of Bourbon. The Infants Don Carlos and Don Philip, and the son of the latter, governed them in succession, but in 1805 the two dutchies were united to the French empire, and formed the department of the Taro. They were made over in 1814 by the Congress at Vienna, to the Archduchess Maria Louisa during her life; the inheritance is vested after her death, in the Lucchese princes of the house of Bourbon Anjou, and their successors.

The states of Parma consist of the dutchy of the same name, and two others, Placentia and Guastalla; they are bounded on the north by the Po, on the east by the dutchy of Modena, and on the south and the west by the dutchy of Massa and the Sardinian possessions. Parma, the capital the largest town in the dutchy, is situated on the banks of the

^e " Its inhabitants, the *Latini*, were a mixed people, descended from a colony of Pelasgians from Thessaly, blended with a people whose origin was so uncertain that they were called *Aborigines*."

Parma, a torrent that is dry in summer. The old walls and bastions form a circuit of four miles; the streets and squares are spacious, but neither the houses nor public buildings are remarkable for their architecture. The cathedral is a Gothic and imposing edifice; the palaces and other churches are simple and destitute of ornaments, but worthy of being visited from the valuable paintings contained in them. The old Farnese palace, built of brick, resembles a convent rather than the residence of a prince. In the same edifice are the academy of fine arts, the library, and the largest theatre in Italy, the masterpiece of Vignola, admirable on account of its architecture, and the fine proportion of its parts. It is capable of containing 9000 spectators,^a and the interior is so well arranged that the stage is equally visible from every point in the theatre, and an actor speaking in a low tone of voice is heard at the remotest corner of the house. It may be regretted that so fine an edifice has not been used for more than a century; another theatre of smaller dimensions is situated in a different part of the town. A plain building behind the Farnese palace, is the residence of Maria Louisa; in one of the rooms may be seen the cradle of her son, and the toilet and costly furniture, which the city of Paris gave to the wife of Napoleon. Parma has been improved by the same person. Before the year 1822, there was no cemetery belonging to the town; the dead were interred in the churches, and the church of *San Giovanni Decollato* was reserved for criminals. Physicians were aware that the custom had been injurious to the health of the inhabitants, and it was abolished by the reigning princes; a large piece of ground without the walls of the town has been converted into a cemetery. Parma possesses five charitable institutions and a foundling hospital established in 1818 by the archduchess; the management of the latter is committed to a director and to five ladies, one of whom must visit it every day.

Guastalla, the metropolis of an ancient duchy, contains little worthy of notice. Placentia,^b like Parma, is encompassed with walls and ditches, but it is a better built town, and possesses numerous palaces. The ducal palace, although a brick building, still serves to proclaim the wealth of the Farnese, and the talents of Vignola, who planned it. Other edifices may attract the notice of strangers; but, like Versailles, Placentia consists of broad, straight and deserted streets, in many places not unlike roads.^c The square of the palace is decorated with two bronze equestrian statues, representing princes of the Farnese family. It has been supposed that the town owes its name to its fine situation and salubrious air. Two centuries before the Christian era, it was one of the principal cities of the Roman republic; but no traces of its antiquity remain; it was devastated during the war between Otho and Vitellius. It sustained a memorable siege against Totila in the year 545; the inhabitants suffered so much from famine, that they appeased their hunger with human flesh. The same town has given birth to several distinguished men; among others, to Ferrante Pallavicini, an ecclesiastic of the seventeenth century, not less celebrated for his writings than his tragical death, in which Rome had some share;^d to Lorenzo Valla, who contributed in the fifteenth century to restore the Latin language to its ancient purity in Italy; to Gregory

the Tenth, who ordained that on the death of a pope, the cardinals should be confined in conclave until the election of his successor; and lastly, to cardinal Alberoni, who has been termed the Richelieu of Spain.

The burgh of Campre-Moldo is the Campo Morto, near which Hannibal defeated the Romans at the battle of the Trebia. The remains of *Veleia*, a town that appears to have been destroyed by an earthquake, were discovered in the year 1760; they are covered with stones and earth to the depth of more than twenty feet. The great quantity of bones, medals, and other valuable articles which have been from time to time discovered, indicate that the inhabitants, like those of Herculaneum, had not time to escape, but were engulfed with their riches. *Veleia* was the metropolis of more than thirty towns and burghs, of which the names inscribed on a bronze table, still preserved in Parma, resemble the names of many villages in the neighbourhood.

The commerce of Parma is inconsiderable; its manufactures consist of silk, lace, and different liqueurs. Rice and silk are the principal products of the duchy. Workmen collect annually near Salzo Maggiore, at ten leagues to the south of the capital, three hundred thousand hundred weights^e of salt, which form nearly two thirds of the consumption. The petroleum oil, used by the inhabitants, is obtained in great quantities from the same salt springs.

The duchy of Modena, situated between the Lombardo-Venetian kingdom, the duchies of Parma and Lucca, and the States of the Church, is about thirty leagues in length and fourteen in breadth. This state, after having belonged to the emperors, the popes, the Venetians, the dukes of Milan, Mantua and Ferrara, and other princes, was added in the thirteenth century to the possessions of the house of Este, that reigned at Ferrara. It was united to the Cisalpine republic in 1796, and formed afterwards a part of the kingdom of Italy. But the archduke Francis, who succeeded by right of his mother to the ancient duchy, took possession of it in 1814.

Modena, an agreeable and well built town, of which the streets are adorned with arcades, contains no remarkable edifice except the vast ducal palace, which stands isolated in a large square. It gave birth to Gabriel Fallopius, one of the most distinguished anatomists of the sixteenth century, and it has contributed to the advancement of science by the labors of its scientific society.^f

Reggio, the ancient *Regium*, which was ruined by the Goths, and rebuilt by Charlemagne, was joined to the dominions of the house of Este, after having been long governed by its own magistrates. It was formerly the chief town in a duchy, of which the title was restored by Napoleon, and conferred on one of his bravest generals. The fortifications are not more important than those of Modena, but the town is well built, and contains a great number of convents; it carries on a trade in silk. Reggio was the birthplace of Ariosto. The country between Modena and Reggio, is pleasant and fruitful; the hills in the neighbourhood are covered with country houses, and vines entwined round fruit trees. The small town of Mirandola, in the northern part of the duchy, was governed by a prince, who at an early age was a prodigy of erudition, and who

afterwards renounced his principality to devote himself to the sciences.

The dutchy of Massa does not exceed fifteen square leagues in superficial extent ; it is bounded by the Mediterranean, the Sardinian states, and the dutchies of Modena and Lucca ; although a very small district, it is perhaps the finest part of Italy. No valley can be more romantic than that of the *Fiume Frigido*, a stream descending from the mountains, and enlarged by melted snow, forming several water-falls in the higher or narrow part of the valley, shaded by lofty trees, that add to the coolness and freshness of the air even in the midst of summer. But towards its other extremity, the valley becomes broader, and the view from it more extensive ; in spring, when the heat of the sun begins to dry the plains, the snow and the verdure of the meadows, when seen from a distance, form long streaks on the sides of the mountains.

This dutchy depended formerly on that of Modena, but its territory was added to the principality of Lucca and Piombino, which Eliza Bacciochi, the sister of Napoleon, governed in the time of the empire. It was anew made a dutchy in 1814, and restored to the archduchess Maria Beatrice, after whose death it reverts to her son, the Duke of Modena.

The small town of Massa is finely situated in a plain at no great distance from the Mediterranean. The ruins of the cathedral serve to recal an unjust act of power, committed by the last princess, whose government has rendered her dear to the people, but who was not free from the faults to which persons are liable, that rise suddenly from low to high stations. Eliza Bacciochi thought the cathedral too near the palace ; chanting was apt to make her melancholy, and the smell of frankincense made her cough ; for these reasons the venerable building was demolished, although the inhabitants were clamorous, and the magistrates remonstrated.

The small town of Carrara derives its importance from inexhaustible marble quarries, that have been worked for a period of more than two thousand years. The neighbouring mountains are almost wholly composed of marble, to the height of about twelve hundred feet,^a and over an extent of not less than two leagues. The marble does not form beds ; the finest and the whitest sort is united with the kind that the inhabitants use in building their houses. More than twelve hundred men are employed in working the quarries, and the duty levied on the exports from them, makes up a tenth part of the public revenue.

The dutchy of Lucca, situated between the dutchy of Massa and the grand dutchy of Tuscany, was changed into a republic after the death of the countess Matilda in 1115 ; it continued however more or less subject to the emperors, and Lewis of Bavaria erected it anew into a dutchy about the year 1316. Its government was often changed ; but it preserved its freedom from the fifteenth century to the period when it was united to the states of Eliza Bacciochi. It was granted as an indemnity to the ducal family of Parma in 1815, to be afterwards annexed to the grand dutchy of Tuscany.

The Lucchese are one of the most industrious people in Italy, as the state of their agriculture, their trade in olive oil, and their velvet and silk manufactures, sufficiently

evinced. Probity is always the companion of industry, and the honesty of the Lucchese peasants has been commended by many travellers.

The town of Lucca is watered by the Serchio ; it has its ramparts and palaces, but the ramparts are slight fortifications, and the strong walled palaces with their grated windows might be mistaken for prisons. The ramparts are adorned with lofty trees, and form agreeable walks ; the pointed roofs of the houses, and the irregular and tortuous but well paved streets, render Lucca more like a northern than an Italian city. All the churches are too profusely streaked or adorned with different coloured marble. The celebrated baths in the neighbourhood are much frequented ; their temperature is about 45° of Reaumur.

The grand dutchy of Tuscany forms the most important principality in Italy ; it is bounded by the dutchies of Lucca and Modena, the States of the Church, and the Mediterranean. Although the climate is unwholesome, particularly in the part near the sea, Tuscany is noted for its fruitful soil and romantic scenery. The wines of the same country are valuable ; the red resembles Claret, and the white is more delicate than Sauterne. But the labours of the husbandman are sometimes destroyed by winds and inundations, and the burning Sirocco exerts too often its fatal influence.

The Maremma, a territory so called from its vicinity to the sea, is the most unhealthy region in Tuscany, and one not less remarkable for its pestilential humidity, than the other districts for their fertility and for their fine and diversified scenery, of which the description has been given by Addison. The Maremma extends over a space of forty-three leagues in length, to the neighbourhood of Sienna, Pisa and Leghorn. It is equal in superficial extent to sixteen or seventeen hundred English square miles ; the present population does not exceed forty persons for every square mile ; but before the country was conquered by the Romans, it was the most populous region in Italy, for in the Maremma were situated the Etruscan towns of *Rosella*, *Saturnia*, *Populonia*, *Cossa*, and *Ancedonia*, of which walls, baths, amphitheatres and other ancient monuments still remain.^b But the country and the towns have been desolated by the depredations of the Romans, and the successive invasions of barbarians. Destitute of inhabitants, the Maremma is covered with wood, and the waters which an industrious population confined in canals, have formed numerous marshes, and their exhalations occasion dangerous diseases. Before the Etrusci or Rhasenæ were settled in the Maremma, the land was probably in the same state as at present, but they surmounted the obstacles arising from the insalubrity of the soil, and the country became flourishing. Colonies of Greeks, perhaps Egyptians, were settled in the Maremma ; the emperor Claudius had his country houses and gardens in the same region, which was well adapted for the vine and different fruit trees. Every thing like agricultural wealth has now disappeared, and the stranger observes only the wretched cottages of a few peasants^c in the places where a numerous and industrious population devoted themselves to agriculture. The dukes of Tuscany made several vain attempts to repeople these marshy districts. Cosmo the Third introduced a colony of Mainotes^d from the Peloponnesus, but in a short time they were destroyed by

the effects of the climate; colonists from Lorraine were afterwards invited, and they shared the same fate. Much remains to be done before the soil can be rendered useful for agriculture; skilful men must be consulted on the best method of checking the fatal effects of pestilential exhalations; the soil must be drained by government, and experienced agriculturists must determine the plants best adapted for the climate, or the most likely to repay the husbandman for his expenses and labour.

Tuscany was conquered by the Goths in the sixth century, and they kept possession of it during sixty years. Alboin, king of the Lombards, having defeated them, erected the country into a dutchy, and made it a fief dependent on his crown. Charlemagne having conquered Lombardy, appointed counts, who were afterwards entitled marquises, over the dutchy; they were vassals of the empire. The cities in Tuscany retained their prosperity for a long time; they were governed by magistrates appointed by the citizens. Rome, in order to weaken the imperial power, induced these towns to enter into a league similar to the one formed by the towns of Lombardy. The execution of the plan was reserved for Innocent the Third, and the *honour and aggrandisement of the apostolic see*, became the watchword of citizens, who were long faithful to their engagements.^a Pisa, Sienna and Florence were the most important of these republics, and their chiefs were styled *Gonfalonieri*. They had amassed considerable wealth by commerce in the fourteenth century, but as if states that acquire power by usurpation, were destined to submit to usurpers in their turn, Florence, having taken possession of Pisa unjustly, was punished by becoming the domain of the Medici, a family that by fortunate speculations had become the most wealthy in the town. Alexander di Medici was made duke of Florence in 1531 by the interest of Charles the Fifth, and his son obtained from the pope and the emperor, the title of grand duke. After the extinction of the Medici in 1737, the grand dutchy passed to the duke of Lorraine, who ceded that province to France. The same duke was raised to the imperial throne, and his son was appointed his successor in Italy. But the house of Lorraine was deprived of the dutchy by Napoleon, who gave it to his sister Eliza.^b Latly, the archduke was restored to his dominions in 1814, and Elba was added to his states in the following year.

The two principal streams in Tuscany are the Ombrone and the Arno, both of which throw themselves into the sea. The Arno, enlarged by several smaller streams, may be considered a river; it made formerly a long circuit, but its course has been shortened and confined by dikes, and the lands which it inundated are now cultivated. The valley of the Arno,^c in the Appennines, from which the river takes its rise, was in the time of the Florentine and Pisan republics, embellished with the country houses of wealthy merchants; in the same valley, at present peopled by workmen, are manufactured the lined stuffs that form an important article in the commerce of Tuscany, and also the straw hats well known as Leghorn hats, from the name of the port whence they are shipped to all parts of the world.

The Arno traverses Pisa at the distance of about a league from its mouth.^d The town is one of the most ancient in Italy; the streets are broad and well paved. The cathed-

ral, a Gothic edifice, is built of marble; three bronze gates adorn the portal, and seventy-four columns, sixty-two of which are of oriental granite, support the roof. The interior, it must be admitted, is rather gloomy; an old chandelier of rusty metal hangs from the vault. Galileo happened to be in the church, when a workman carrying a ladder, struck the chandelier by accident, and its swinging motion suggested to the philosopher the first notion of the pendulum. The first pendulum clock constructed by Galileo, is still preserved at Pisa. The *Baptistry* is a church reserved for baptisms; its Gothic vault is so sonorous as to produce several effects which guides never fail to indicate to strangers; if the floor or pavement be struck, it resounds for a long time; if a person speaks in a loud voice, an echo repeats several syllables, or if he speaks in a whisper in any corner of the church, he is distinctly heard at the opposite extremity. The *Campanile Torto*, or leaning tower, has been considered the most singular edifice in Pisa. Beautiful columns of white marble rise from its base, and support six tiers of arcades, surmounted by a tower of smaller diameter than the base.^e The height of the tower is not less than a hundred and ninety feet, and the inclination from the ground to the summit, about fifteen feet from the perpendicular. At the sight of so singular a monument, it is difficult to decide whether it was the original intention of the architect to construct it with so great an inclination, or whether, as many professional persons suppose, it may be attributed to the sinking of the ground. Not far from the leaning tower, the cicerones show with veneration the *Campo Santo*, a rectangular court of vast size, surrounded with a sort of Gothic arcade, the walls of which are painted in fresco. It was constructed in the thirteenth century for the purpose of securing an enormous heap of earth, brought from the Holy Land by the Pisans after the third crusade; it is said to be nine feet deep, and as the extent of *Campo Santo* is rather more than two English acres,^f it must have required fifty ships of three hundred tons burthen, and perhaps three times that number of such vessels as were then in use, to transport so great a mass of sanctified mould.^g It is believed that the bodies which are buried in it, are very speedily consumed; the time formerly required, was said to be less than twenty-four hours; the Pisans themselves admit that it takes at present more than two days; their calculations are in all probability incorrect; such miracles must be confirmed by undoubted experiments.

Florence (It. *Firenze*) rises on the banks of the Arno, at a greater distance from its mouth than Pisa. Four bridges are built across the river, and these communicate with four quarters, two leagues in circumference, and three thousand yards^h in length. Florence, if it may be so said, was the cradle of the arts at the time of their regeneration, and the numerous objects of art still contained in the same place render it one of the most remarkable cities in Europe. Michael Angelo thought it impossible for an architect to raise a finer building than the cathedral; an isolated tower at no great distance serves as its belfry, and Charles the Fifth was so much pleased with its finished elegance, that he said it ought to be kept in a glass-case,ⁱ in order to defend it from the wind and the atmosphere. The three bronze gates of the Baptistry are wrought with so much art,

ⁱ "Etuï."

that Michael Angelo thought them worthy of being placed at the entrance into paradise. The royal chapel or the tomb of the Medici, begun about three centuries ago, and not likely to be ever finished, is one of the most curious works in Italy; jasper, lapis lazuli, granite, porphyry, alabaster, and the rarest marbles, are collected in such profusion, that it resembles not so much a sepulchral monument as a magnificent mosaic. The church of Santa Croce, a brick building originally intended to be covered with marble, contains the ashes of many illustrious men. The tomb of Michael Angelo supports his own bust by himself; that of Vittorio Alfieri was sculptured by Canova; there too are the remains of Galileo, Aretino and Macchiavelli, the last of whom is represented weighing a sword and a roll of paper in a balance.

The *Poggio Imperiale*, and the *Ricardi*, *Strozzi*, *Corsini* and *Gerini* palaces, are worthy of being described, but it would be necessary to enter into details incompatible with our limits. The ducal palace, called *Palazzo Pitti* from the name of the person who built it in the year 1460, exhibits a character of solidity which promises ages of duration. It consists of three lofty stories divided into nine hundred apartments. Many of them, carved and gilt all over, are furnished in the most costly manner. In one suite are contained a valuable collection of paintings and a number of Florentine mosaic tables, differing from the other mosaics in Italy, by the large pieces of which they are formed. The labour required in these works is hardly credible; fifteen, twenty, and twenty-five years have been spent by a set of artists working together to finish a single table.^a The famous Venus of Canova decorates one of the halls, and the palace communicates with the Florentine gallery by a passage six hundred paces in length. A stranger may there judge of the former magnificence of the Medici; he may admire the Venus that bears their name, other ancient statues which were long the principal ornaments of the Louvre, and several *chefs d'œuvre* by the greatest Italian painters. The Boboli gardens adjoining the palace are in the taste transmitted to us by the ancients; they are praised by the Italians, who admire rectangular walks flanked with cut trees, fashioned into a wall, or arched overhead. The squares in Florence are adorned with more than a hundred and fifty statues. Two obelisks rise on the *piazza* of *Santa Maria Novella*, which serves as a course for chariot races, similar to those of the ancients. Horse races are also an amusement; the race ground is more than two miles in length. The quays in Florence are much finer than any in Paris.

Prato rises on the north of Florence towards the Appennines, on the banks of the Bisenzio; it is a place of some trade; the inhabitants manufacture copper utensils, and its fairs are more frequented than any in Tuscany. Pistoia is situated at the base of the Appennines; there are few towns in Italy in which the streets are so broad or so straight; it formed at one time a republic; it carries on a trade at present in fowling-pieces, silk and straw hats.

At a league to the east of the canal that unites the *Arno* and the *Chiana*, is situated Arezzo, an ancient town of which the Latin name *Aretium*, was derived, according to some, from *Aretia*, a surname of Vesta, and according to others, from the eastern word *Aretz*, which corresponds with its situation, and signifies *an agreeable place on the*

waters. In the time of the Etruscans it was celebrated for its pottery, its wine, and a fountain from which oracles were delivered. It was the birthplace of many great men, of Mæcenas, of the martyr Saint Lawrence, of Petrarch, of Guido Aretino, who invented or discovered anew the notes of music, of Pope Julius the Second, of Pietro Aretino, and of Concini, marshal d'Ancre. On the Appennines, and at eight leagues to the north of the town, stands the famous convent of the Camaldolites, founded in the beginning of the eleventh century.

Cortona to the south-east of Arezzo, rises on the declivity of a hill, which overlooks a fine plain, watered by the Perugian lake. It is supposed to occupy the site of *Corythus*, a town mentioned by Virgil, but which did not exist in his time.^b Walls constructed of very large stones that are not united by any cement, may still be seen at Cortona; they were raised by the most ancient inhabitants of Etruria. Although a very small place, it has possessed since the year 1726, an Etruscan academy, which has been of much use by its researches.

“ Fallen from its former rank, as a republican city containing a hundred and fifty thousand inhabitants, to that of a provincial town having only fifteen or twenty thousand, and with the melancholy title of capital of the *Maremma*, Sienna exhibits no signs of decay, but on the contrary every appearance of active industry. Scarcely any beggars; the streets well paved and very clean; the shops numerous and well supplied; the people well dressed and the women remarkably good looking and graceful even in the ludicrous attitude of riding astride on donkeys, which seems the custom both with ladies and market women, all showing their garters at the top of a well formed leg, and snow white stockings. The cathedral is a nondescript edifice, built in the thirteenth century, when the Gothic style of architecture prevailing beyond the Alps, was with difficulty making its way in Italy. It is therefore half Gothic, half Grecian; slender shafts with Corinthian capitals, and round arches. The most remarkable feature of this singular edifice, is the party coloured marble on the outside; broad stripes of dingy brown and dirty white alternately, like the zebra's skin. Nothing can possibly be in worse taste; but the inlaid pavement done in 1460, is on the contrary very beautiful.”^c

There is only one square at Sienna, the *Piazza del Campo*; it is hollowed in the form of a basin, adorned with a fine fountain, and lined with palaces in the Gothic style. Saint Catherine, the tutelar saint of the town, is as celebrated in the country, as Saint Genevieve in Paris. Born in the fourteenth century, the daughter of a poor dyer, she acted an important part in the ecclesiastical affairs of Italy. She was sent to Gregory the Eleventh, to persuade him to quit Avignon, and to restore the papal throne to Rome. It is said that a society established in 1464 in the house inhabited by the saint, continues to endow every year the daughters of poor artisans, who walk in procession on her anniversary, and on these occasions make choice of their husbands. A number of young men stand near the procession, and each gives a handkerchief to her whom he loves; if she refuses, she kisses the handkerchief, and returns it; if she consents, she ties a knot in it, and then presents it to her bridegroom.

A Roman colony was sent to Sienna by Augustus, and

^a Simond's Travels.

^b Æneid. L. III. v. 170. [*Coritus*].

^c Simond's Travels in Italy and Sicily, page 570.

it was then called *Colonia Senensis*. The Italian language is spoken in greater purity in the same place, than in any other town in Tuscany; the pronunciation of the Siennese is also the most agreeable. It possesses several academies and a university; the inhabitants are gay, lively and well informed; it has produced several celebrated men, among others, seven popes, and Socinus, the chief of the Unitarians, who reject the mystery of the trinity, and believe Christ, although participating in the divine nature, to be inferior to God.

The road from Sienna to Leghorn traverses the Etruscan town of *Volterra*, the name of which remains the same, but the population, which amounted formerly to a hundred thousand, is now reduced to four thousand inhabitants; it was once one of the twelve principal cities in Etruria, but is now almost deserted. The populous and commercial town of Leghorn, a small burgh in 1120, is at present peopled by seventy-five thousand individuals, including the inhabitants of its three suburbs, which contain more than thirty thousand. The streets are straight and well built, the port is frequented by merchant ships, and the town is a place of extensive trade. The principal edifices are the magazines, the arsenal and three lazarettos. The only monument worthy of notice, is the marble statue of Duke Ferdinand the First, in the attitude of a conqueror with four bronze slaves at his feet. The harbour is six hundred yards in length, and seventy-two in breadth; hulks^a are kept for the purpose of taking away the pebbles and alluvial deposits, which are brought by the sea. A great many Jewish and Greek merchants are settled in the town; among the exports are soap, alabaster and coral. Ophthalmia is a disease peculiar to its soil; it has been erroneously attributed to the sandy dust driven by the winds, and to the humidity of the quarter called *New Venice* on account of its numerous canals; it appears on the contrary to arise from the comparative coldness of the night air during the summer season.

Piombino, a sea port to the south of Leghorn, is situated at a short distance from the ancient Etruscan town of *Populonia*, which was destroyed in the ninth century by the patrician Nicias, but of which some remains of walls without cement are still extant. Not far from these walls are extensive ruins, which, according to some, were originally an amphitheatre, while others suppose them to have been part of the ancient *Vetulonia*.^b Piombino stands on a rock, and gives its name to the neighbouring gulf. The air and climate are unwholesome, and the population, which peace and commerce have not augmented, does not exceed two thousand inhabitants.

The island of Elba, not more than three leagues from the continent, may be distinctly seen from Piombino. It was subject in the thirteenth century to the Pisans; it was afterwards taken by the Genoese, and remained at different times in the possession of the dukes of Milan, and the king of the Two Sicilies, who ceded it to France in 1801. The island contains fourteen thousand inhabitants; it was

the residence of Napoleon, to whom it was given in sovereignty by the treaty of 1814, and who by quitting it on the 25th of February, 1815, in order to return to France, brought on that kingdom a second foreign invasion more disastrous than the first. Porto Ferrajo, a fortified town with a harbour on the northern coast, and containing five thousand inhabitants, is the capital of the island. Porto Longone, a small town of 1,500 inhabitants, is defended by a fortress built on a rock; its harbour is called the Marina.

Tuscany owes to Duke Leopold the prosperity which it still enjoys; that prince had corrected many abuses before the year 1772; the convents were not nearly so numerous as in other Italian states; indeed the most useless orders were abolished; the Inquisition was rendered merely nominal; the punishment of death was almost unknown, for it was only once inflicted during his reign; the system of taxes was improved, and they were regularly paid; industry and commerce were freed from their shackles, and education was encouraged among the lower orders, a class of people that are kept in Italy in the most abject ignorance. These improvements, which are honourable to the greatest prince that ever governed Tuscany, prepared the people to adopt without reluctance the French laws; but during the late changes, part of the old system has been amalgamated with the Napoleon code, the lands of religious communities have been restored, new abuses have been introduced, and the Tuscans, whose mildness is proverbial, and who as a people are very easily satisfied, have ventured to complain.

During the fifth century, a Dalmatian stone-cutter, by the name of Marino, whose piety induced him to preach Christianity, built a hermitage on the coast of the Adriatic, near the summit of Mount Titan.^c His religious zeal procured for him the title of saint, and after his death, he received the honours of canonization. A town rose in the year 600, near the hermitage of San Marino, from which it took its name. It was formed into a republic, fortifications were erected, and two or three small fortresses in the neighbourhood, were in course of time acquired. The popes took possession of the republic in 1739, a very insignificant conquest, but the emperor of Germany restored it to freedom. Enclosed by the states of the Holy See, it is at present under the protection of the pope. This little republic, which adopted the following protocol in writing to that of Venice, *Alla nostra carissima sorella, la Serenissima repubblica di Venetia*, occupies a surface of five square leagues; the town of San Marino, and two villages, are contained in it. The wines, which are the principal products of its territory, supply its commerce. The sovereignty is vested in a council of three hundred ancients, and the executive power in a senate composed of twenty patricians, twenty burgesses, and twenty peasants, whose presidents are two *gonfalonieri*, elected every three months. These two magistrates have a guard of thirty men, but if the freedom of the republic is endangered, every citizen becomes a soldier.

BOOK CXXXV.

EUROPE.

*Europe Continued.—Description of Italy.—Fifth Section.—
Description of the States of the Church.*

ALTHOUGH the subjects of the different princes in Italy, resemble each other in several particulars, we think it proper to describe in a separate book, a state which, in a political point of view, differs from every other in Europe. It is not uninteresting to contemplate an elective monarchy having for its domain the earth, on which it only occupies a point, and for its empire the heavens, from which it looks on kings as its inferiors. It is not easy to define or even to characterize such a power as that of Rome, which passes for the most ancient in Europe. The papal tiara is adorned with a triple crown; he who fills the throne, and wears the diadem, is called the successor of St. Peter; in general, he may be as much entitled from his advanced age as from his rank as prince of the church, to the homage and veneration of his people, but he also claims the homage of kings and all the powers on the earth. Is it as the successor of St. Peter that he is clothed in purple, that he wears the emblems of royalty, that he has his soldiers, that justice is administered in his name, and that he prevents crimes by punishing the guilty? Are not the two powers with which he is vested, incompatible with each other? Can the *servant of the servants of God* appear without inconsistency in royal pomp? Is it necessary that he should be one of the weakest princes in Christendom, in order, as the vicar of our Saviour, to be greater than the kings of the earth? Such are the reflections which naturally occur in considering the pope as uniting the sovereign power with his dignity as chief of the church. But what appears an anomaly at a time when governments and powers are defined, might, in the early ages of Christianity, have resulted from the course of events, and from the force of circumstances.

The supremacy of the apostolic see of Rome over the other churches, dates from a very remote period. Irenæus, bishop of Lyons, in the second century, and Cyprian, bishop of Carthage in the following century, admitted it as an uncontested point, without, however, deducing all the consequences which were afterwards derived. Before the period that Italy was invaded by Pepin, the popes had no political power, no temporal possessions. The pretended donation made by Constantine to Silvester the First, has been considered fabulous by the most able critics and by the Ultramontanes themselves.^a Pepin, mayor of the palace of Childeric the Third, wishing to maintain his usurpation by the consent of the nation, and the authority of the church, consulted solemnly pope Zachary, who answered, like the oracles of old, that the sovereignty belonged to him who exer-

cised the royal power. Such an answer satisfied the scruples of the minister; his master was confined in a convent, and he himself was proclaimed king by the French. But when Pepin had expelled the Lombards from the exarchate of Ravenna, he gave it from a motive of gratitude or policy to pope Stephen the Second. The donation was afterwards ratified by Charlemagne, who added to it the Perugino and the dutchy of Spoleto. The bishops of Rome being raised to the rank of temporal princes, were no longer destitute of ambition; it was not, however, before their spiritual power reached its height, that they extended their dominions. The emperor Henry the Third gave them the dutchy of Benevento in the eleventh century; Matilda, countess of Tuscany, bequeathed to the Holy See, in the twelfth century, the territories of Bolsena, Bagnarea, Monte-Fiascone, Viterbo, Civita Castellana, Corneto, Civita Vecchia and Bracciano, possessions which form what is called the *Patrimony of St. Peter*. Rome, then merely the residence of the popes, belonged to the empire; it was divided by republican factions. Men possessing qualities that were ill adapted to the spirit of the age, attempted vainly to establish a free government. Rome and the contiguous province of Sabina were not included in the domains of the Holy See, until the end of the fourteenth century. Lewis Gonzaga, general of Clement the Seventh, united the March of Ancona to the States of the Church in 1532. The dutchy of Urbino, which belonged to the family of Julius the Second, became the possession of the popes in 1626. The latest conquests the popes made, were the Orvietano, the dutchy of Castro, and the county of Ronciglione. The two last principalities were the inheritance of pope Paul the Third, and he left them to his son Farnese, who became duke of Parma and Placentia; but one of his descendants mortgaged them at the Mount of Piety in Rome, for a sum which he was unable to pay, and Innocent the Eleventh took possession of them.

The part which the pope took, as temporal prince of the church, in the European coalitions against France, was attended with disastrous consequences; it is by no means improbable, that if Napoleon had retained his power, the popes might have been reduced to their ancient condition under the eastern empire. The invasion of Lombardy and the States of the Church by the French, forced Pius the Sixth to conclude a treaty on the nineteenth of June, 1796. It was stipulated that he should cede to France a certain number of statues, vases and pictures, and five hundred manuscripts to be selected by the commissaries of there public, that he should pay a contribution of 800,000^b

^a J. Lesueur, Histoire de l'Eglise et de l'Empire, tom. ii.—Histoire de la

délivrance de l'Eglise, par le P. Morin.—Dictionnaire de Moreri, art. Sylvestre.

^b "21 millions francs."

that he should grant a free passage to the French troops, and that he should open his ports to French vessels, and shut them against the ships of every state at war with the French republic. The treaty was soon broken by the pope himself; fortune seemed to declare against France, and Pius the Sixth took possession of Ferrara on the thirty first of January, in the following year. A letter intercepted by Buonaparte proved that his holiness was treating with the emperor of Germany; but at the approach of the conqueror, new conditions were proposed by the Holy See. The sum of thirty-six millions of francs or 1,500,000*l.* was exacted by the French generalissimo, and the other terms of the former treaty were anew concluded. But the assassination of the French general Duphot, at Rome, at the close of the same year, furnished the Directory with a pretext for overturning the Papal government. General Berthier received orders to march against Rome, and the states of the Holy See were transformed into a republic. When the French left Italy, the ephemeral republic fell of its own accord. The Roman states, in consequence of new political combinations, were united to the crown of Italy in 1808. By a decree of Feb. 17, 1810, they were included within the limits of the French Empire, and Rome and Paris were then fixed as places of residence for the pope. A new revolution was the result of the events in 1814, and Pius the Seventh recovered all the former possessions of the church.

The Roman states are bounded by the Adriatic Sea on the east, by the Lombardo-Venetian kingdom on the north, by the duchies of Tuscany and Modena on the west, by the Mediterranean on the south-west, and by the kingdom of Naples on the south. Their extent is equal to ninety-five leagues in one direction, and to twenty-five in the other; their surface is equal to about two thousand two hundred and forty square leagues. The ancient denominations, such as duchies, counties and others already mentioned, by which the different provinces were distinguished, have been abolished; the country is now divided into three districts and seventeen legations.^a The example of the French administration has been the means of occasioning reforms in the laws, in the administration of justice, and in the distribution of taxes; much, however, still remains to be done, and it is to be feared that the popes will never be able to establish within their dominions, the moral improvement, the love of industry, and other good qualities of which the Roman people might perhaps be susceptible under a different government. To form an idea of the manners and government of the people in the Roman states, it is only necessary to visit the capital.

The ordinary method of life at Rome, may be termed a long lent, so much attention do all the inhabitants pay to the exterior duties of religion. That large city, which might contain three times more than its present population, has a sombre appearance, rendered still more striking by large squares, spacious and deserted streets, numerous monks and priests, and the majestic ruins which are seen at every step. The very market places are almost as much deserted on market days as the rest of the town. But the

stillness is changed into noisy mirth at the time of the carnival; Rome is no longer the same city, all ranks are then confounded, the churches are deserted, and the streets can hardly contain the inhabitants, all of whom leave their houses, and join in the joyous throng. On these days of folly are seen young abbés, grave magistrates, and even prelates, covered with masks, and in quest of pleasures, which may be easily found, for both sexes are persuaded that a few moments of error are fully expiated by the penitence and holy privations of lent. Tumultuous crowds assemble in the Corso, which is on these occasions lined with two files of carriages; pieces of tapestry and other ornaments are suspended from every window; *confetti* or small fragments of puzzolana, dipt in lime water to imitate sugar plums,^b are thrown against the foot passengers and the equipages, followed by the shouts and applause of a multitude in masks of every colour. At a given signal,—the report of a cannon, the middle and the greater part of the Corso are cleared: horses without riders are seen in full gallop; tinsel glittering about their manes and tails; ribbons with burning matches, streaming in the wind; sparks flying from their back, sides and every part of their body; thus galled and tormented, the frightened animals run at full speed.^c The follies of the carnival, which may be compared to the *lupercalia* of the ancient Romans, are accompanied with other diversions on the night of Shrove Tuesday; men, women and children run about the streets with lighted tapers^d in their hands, and pursue each other in order to extinguish them. Every equipage must also be illuminated, otherwise it might be broken by the populace. The same customs were observed in ancient Rome during the festival of Ceres seeking for her daughter Proserpine.

It might be naturally imagined that the police are careless or useless in a capital, where government, instead of punishing, negociates with bandits; it must be admitted, however, that there are few towns where the police are more efficient or better regulated than at Rome; no disturbances in the streets, no robberies, none of the petty larcenies so common in great towns; it seldom or never happens that handkerchiefs and watches are stolen. It cannot be denied that stilettos are sometimes used, but it is from jealousy, not from avarice or desire of gain. The streets of Rome are not sullied by the degraded beings, tolerated in other towns as a necessary evil, and the sight of whom serves to tempt the wicked, and to offend the virtuous. Public women are banished without any scruple, or at all events they can never be distinguished by indecent effrontery. It may be mentioned to the honour of the papal government, that it has done much to suppress licentiousness and immorality by encouraging marriages. Marriage licences, says an author, are granted with as much facility as passports, and as soon as these licences are presented, the curates must read the marriage ceremony, and pronounce the nuptial benediction. He who seduces a young woman, is obliged to marry her, or to pass five years of his life in the gallees.

The church condemns usury, but it permits the cardinals to enjoy the most unjust monopolies. They only are permitted to sell the necessaries of life,^e such as oil, groce-

^c “—Horses without riders, goaded by plates of metal covered with points and by a lighted match inserted between the skin and the flesh, start from the *Piazza del Popolo* and traverse the Corso” The goads are balls covered with sharp spikes of metal (Rome in the 19th century).—P.

^d *Moccoletti*.

^e This is not stated in the original, but merely that cardinals are permitted to exercise monopolies in the sale of these articles. Others are not prevented from selling by legal prohibitions, but by the vexatious interference of the cardinals or their agents.—P.

ries, corn, flour and bread. The grocers and bakers are merely their agents, or if any wish to exercise their industry on their own account, they are exposed to vexatious oppression. Besides, government regulates the price of bread for the nominal and ostensible reason that the people may not pay too dear for it, but if any baker attempts to sell it under the regulated price, he may be liable to a severe penalty. Most governments are now aware of the bad effects of lotteries; at Rome, however, that iniquitous tax is not only levied on an ignorant and wretched people, but sanctioned by the ministers of religion, for the tickets are drawn in the presence of clergymen, bishops and cardinals;^a children turn the wheel, but before they do so, they make the sign of the cross. Although lotteries are permitted by the church, the same church prohibits games of chance.

At Paris, *gensdarmes* guard the theatres, and are stationed in the public places during festivals; at Rome, government goes further: while the follies of the carnival last, and while the theatres are opened, an executioner walks gravely near his *cavalletto*, an instrument of punishment, destined for those whose turbulent mirth passes the prescribed rules on festive days, or for the critics who venture to condemn or interrupt a theatrical representation. The *cavalletto* consists of two boards joined to each other, and forming two inclined planes; it is supported on four wooden feet, and the two in front are lower than the others. Delinquents are placed horizontally, and bound to it, so as to prevent their escape, while the executioner inflicts a certain number of lashes. Vintners^b must submit to the same punishment, if animal food, or any dishes that are not permitted, appear on their tables during lent. The strappado is an instrument of punishment for greater offences; the hands of the criminal are tied behind his back, he is raised into the air by means of a rope, and allowed to fall suddenly to the ground. The assassin is punished by death, but not until he has remained several days in a dungeon, the victim of suspense, and ignorant of his sentence; he is then compelled to listen to the exhortations of a priest, to confess and to communicate. Three days after these ceremonies have taken place, the criminal is executed; but if he refuses the consolations of religion, he is beset by all the monks and priests belonging to the different congregations,^c until he confess, and if he persists in his refusal, he cannot be punished without an order from the pope. The torture has been abolished, and the Italian or national language has been substituted for the Latin in the civil and ecclesiastical courts, since the accession of Leo the Twelfth.

The government of the Roman States, consists of cardinals who fill certain offices, and laymen to whom different places in the magistracy and army are committed, all of them subject to the absolute authority of the pope. The principal offices filled by cardinals, are that of the *Camerlingo*, or minister of finance, who presides in the Apostolic chamber, or council entrusted with the revenue of the state; that of the secretary of state, who corresponds with the nuncios and legates, and whose office is similar to that of minister for foreign affairs in other governments; that of the *Datario*, who is entrusted with the nomination to va-

cant benefices, with dispensations and with annats; that of the vicar, who besides the episcopal functions which he exercises in Rome, performs the duties of minister of the police, watches over the inhabitants, punishes transgressors, and enforces the laws against the Jews;^d that of the chancellor, whose office is sufficiently indicated by its title; that of the auditor, who administers justice, decides intricate lawsuits, and examines those that are appointed to dioceses;^e and lastly, that of the secretary of briefs, who is charged with issuing all the papal dispensations. Different assemblies of cardinals are called consistories or congregations. The members of the consistories deliberate concerning the nomination of nuncios, legates and bishops. The members of the congregations pass sentence on murderers, who claim the right of asylum or impunity after having taken refuge in a church;^f they examine the complaints of the people against their governors, the claims of those who solicit titles of nobility, and other questions of a like nature. The congregation of rites regulates the ceremonies of the church, and confers after the usual forms the honours of canonization. The chief of these congregations is the Inquisition or *Santo Uffizio*, which is assisted by the *Index* or council of censors. An assembly of cardinals forms the tribunal called *Segnatura di Giustizia*, a court that reviews the decisions of inferior judges.^g The pope presides in the *Segnatura di Grazia*, a tribunal composed of prelates and cardinals, which examines the petitions of supplicants, and the cases in which the royal prerogative of mercy may be extended with advantage. The *Rota*, a tribunal composed of lay judges,^h takes cognisance of civil cases in the first instance; the administration of justice in criminal cases falls within the department of the governor of Rome. Two *Consulta* or courts of appeal are established in the Roman states, the one in the capital, the other at Bologna. The senator and his four lieutenants form another lay tribunal, and the *conservatori* are magistrates entrusted with whatever concerns the interests of the city; they regulate the distribution of the taxesⁱ in the chief town of every district.

Superstition prevails not only at Rome but in all the States of the Church. The inhabitants observe scrupulously all the ceremonies of religion, omitting nothing connected with form or etiquette, although apparently destitute of true devotion. Confession is a practice which all follow, more from custom than Christian humility, and rather to lull the conscience than to correct vice. A lady meets her lover in a church; they may be alone, and it often happens that the churches are deserted; but she never speaks or even looks at him, until she has counted all the beads in her chaplet. The people kneel and receive the benedictions of the pope; it is not at Rome, however, that the chief of the church is thought to participate in the divine power; what he gains in temporal, he loses in spiritual authority. As soon as Easter is over, the curates demand from their parishioners certificates of communion, and if any do not present them, their names are added to the lists of the excommunicated. Although the subjects of the papal government must rigorously observe the ceremonies of devotion, strangers enjoy the utmost freedom: no processes are

raised against foreigners, who do not deck their houses with tapestry on *Corpus Christi* day, and it is not necessary that they should take off their hats, if they see a cross or the viaticum in the streets. Lastly, whatever a man's religious belief may be, he may be assured of having his body transported to the church after death, provided payment be made, and of being interred with all the honours and pomp used by the Romish communion.

It is needless to make any remarks on the *cicisbei* or *cavaliere serventi*; they are as common in Rome as in the other large towns of Italy; during the residence of the French, these lovers were rendered ridiculous, and intrigues were substituted for the contracts which good natured husbands made with the gentlemen that their ladies loved. Foreigners who have lately returned from Rome, admit that the old custom is again becoming fashionable, a natural consequence in a country where the beneficial effects of education are unknown, and where it does not tend to improve the morals.

A government wholly pacific like that of Rome, might console itself for its political nullity, by encouraging and protecting letters, sciences and arts, but an intellectual deadness seems to pervade the Roman states. The sciences are less cultivated than in the rest of Italy, and the town which contains inexhaustible treasures for the archæologist, possesses no antiquarian worthy of being compared with many in Germany and France. The literary academies in Rome are more obscure than other societies of the same sort in the French provinces. The stage cannot flourish in a town where the tragedies of Alfieri are not permitted to be acted, and where the theatres are only open a few days before and after the carnival; and although prelates appear at theatrical representations, it would be much better to prohibit such amusements, than to sanction a criminal mutilation in the holy city, by substituting *castrati* for singing women. No name worthy the best days of Italian painting exists at present in the Roman school, and were it not for the ancient *chefs-d'œuvre* in which Rome abounds, the French academy of the fine arts might as well be established in any other town. Mosaic painting is the only art in which the Romans excel. The people in the upper classes are as indolent and ill informed as the present Venetian nobles; the reading of the young people is mostly confined to the romances of Voltaire, and the girls, in order to make up for the time lost in a convent, read frivolous and dangerous works. The lower orders in the town can read and write, but such knowledge is by no means common in the rural districts.

Enough has been already said concerning the manners and customs of the inhabitants in the capital of the Roman states; some remarks may now be made on the most remarkable ancient and modern monuments that are contained in the same place. Rome stands in the middle of a large plain, which extends from the Appennines to the sea; that plain was formerly fertile, but it is now comparatively sterile. On first entering the town, one can hardly believe himself in the former capital of the Roman empire, so different is papal from imperial Rome. The ancient city is partly concealed by the modern, but some scattered monuments of the former still remaining, notwithstanding the ravages of time, barbarians and Christians, attest its past

existence. The modern soil is so much higher than the ancient, that the Tarpeian rock does not exceed at present twenty-five or thirty feet in height, and the pavement of a small church, built at the foot of the Palatine hill, is exactly on a level with the roof of an ancient temple^a erected on the spot where Romulus and Remus were supposed to have been suckled by a wolf. It was necessary to remove the soil to the depth of twenty-feet, in order to uncover the base of Trajan's pillar. More than half the pedestal of the triumphal arch of Constantine was covered with earth, which had also to be removed before a correct judgment could be formed of a monument that has suffered little from the effects of time, and which although raised in a period when art was on the decline, is nevertheless highly interesting to the antiquary. The fine Egyptian obelisk loaded with hieroglyphics, and cut by order of Rameses, thirteen centuries before the Christian era, was covered with sixteen feet of earth amidst the ruins of the great circus, before it was disinterred in the time of Sixtus the Fifth, and transported to the square of St. John Lateran. The soil reached to more than half the height of the principal gate in the arch of Septimius Severus. Many monuments that still remain of ancient Rome, were cleared by the French government, which did more in a few years than most of the popes, to restore them to the admiration of modern artists.

The Pantheon, a temple erected by Agrippa to all the gods, is perhaps the finest monument of ancient Rome, and certainly the one in the best state of preservation. The hemispherical dome, is equal in height to its diameter, as if the architect had wished to imitate the rotundity of the celestial sphere. The interior of the edifice is a hundred and thirty-seven feet in diameter, and the light enters it by a circular opening eighty feet in circumference. Adorned with a magnificent portico, composed of sixteen granite columns, and crowned with a pediment supported on eight columns, it was easily changed into a church. The tombs of Raphael and Annibal Caracci, the busts of Palladio, Winckelmann and Nicholas Poussin, are now seen instead of the heathen gods that were formerly stationed in the Pantheon. The Rotonda is the modern name of the edifice, and the stranger ascends by steps to the circular opening in the roof. The dome was covered with bronze in the time of the Roman power; Constantius the Second was the first who took part of it away, and sent it to Syracuse; the rest was employed in constructing the famous *Baldacchino* of St. Peter's, and in making the cannon which defend at present the castle of St. Angelo.

The Flavian amphitheatre which has been called the Colosseum or Coliseum, from its gigantic proportions, is not in so good a state of preservation as the Pantheon, because it was impossible to change it into a church; but the people have had some respect for the edifice, since Pius the Sixth erected a large cross in the middle of the arena, and fifteen altars to the memory of the martyrs, who are believed to have perished within the enclosure. Twelve thousand Jews, whom Vespasian made captives, and brought to Rome after the taking of Jerusalem, commenced the edifice, which cost at first a sum equal to 2,083,500*l.*^b and which was finished by Titus. The outer part of the building exceeds fourteen hundred feet in circumference; the interior is five hundred and eighty in length, and four hun-

^a The cella of the temple is now half buried, and therefore the upper part of the ancient walls forms the lower part of the walls of the church. (Rome in the 19th cent.)

^b "50,000,000 francs."

^c "Exterior circumference 1000 feet." (?) The amphitheatre is above 1600 feet in circumference. (Ed. Encyc.)

dred and eighty in breadth. It is said that it could contain 80,000 spectators, but from calculations which appear to be more accurate, the number has been reduced to forty-four thousand.^a When Titus opened the amphitheatre for the first time, the arena was crowded with an incredible number of wild animals of every sort,—foxes, lions, tigers, elephants, stags and gazelles; more than five thousand were destroyed in a single day. The arena was sometimes changed into a lake twenty feet deep; the water flowed through eighty openings, and the people were thus presented with the spectacle of a naval combat. It is customary to visit the Vatican, when illumined with torches, and the Coliseum by moon light; and certainly, the pale light of the moon heightens greatly the effect of the vast amphitheatre; the imagination may conceive the ghosts of gladiators issuing from the vomitories, or the shades of captives that perished before a people accustomed to barbarous spectacles.

The Vatican, which is contiguous to the church of St. Peter, is said to be built on the site of Nero's palace. It consists of several edifices that occupy a much greater surface than both the Tuileries and the Louvre. The interior is divided into twenty courts, and as many porticos, eight large, and two hundred smaller stair-cases, and twelve hundred apartments.^b The great stair-case, which leads to the gallery of antiques, served as a model for the one in the Louvre, to which most judges give the preference. The chapel of the Vatican, or the famous Sistine chapel, is richly decorated, and its finest ornament is the celebrated painting in fresco of the last judgment, by Michael Angelo. The library contains seventy thousand volumes, and forty thousand manuscripts. In the same palace are seen the school of Athens, and the other fresco paintings of Raphael. A small building which communicates with the Vatican, by two long galleries, and which commands a fine view of Rome, and the neighbouring country as far as the Appennines, has on that account been called *Belvedere*. In the same building, and in a much better situation than in the Louvre, is placed the statue of the Apollo,—the *chef-d'œuvre* of ancient sculpture; the Laocoon, the Torso and the Antinous are seen in adjoining apartments.

The Vatican is the residence of the Pope in winter, and the Quirinal palace in summer. Although the form of the latter edifice may be irregular, it has been much admired for the magnificence of the interior, the fine view from it, and the beauty of the gardens. It was reserved, under the French imperial government, for the young prince who received the title of king of Rome. The palace derives its name from the Quirinal hill, on the summit of which it stands. It has also been called the palace of *Monte-Cavallo*,^c because in front of it are two groups of marble statues, each representing a horse of colossal proportions, and a youth seventeen feet in height, who appears to subdue it. The two groups are ancient, but it is not probable that they are the works of Phidias and Praxiteles, as might be inferred from the names on the pedestals. An Egyptian obelisk of red porphyry rises between them, and a fountain, which discharges its waters into a basin of oriental granite, seventy-six feet in circumference, adorns the centre of the square.

^a Simond's Travels in Italy.

^b Number of apartments 10,000 (Ed. Encyc.)—13,000 (Carter's Letters.)

^c *Monte Cavallo* is the modern name for the Quirinal hill.—P.

^d The column on the left was the first mile stone on the Appian way; the other is a modern one made in imitation of it.—P.

Modern Rome has also its Capitol, but it is no longer the Capitol which the masters of the world ascended to return thanks to Jupiter the Thunderer, whose temple commanded the city; near it rose the *Tabularium*, a sacred edifice in which were deposited the decrees of the senate engraved on tables of bronze. The modern Capitol is an insignificant hill, styled by corruption the *Campidoglio*, and the buildings on it are the residences of the municipal magistrates. A flight of steps, planned by Michael Angelo, leads to the top of the hill. Two antique lions of basalt guard the foot of the stairs, and two naked *colossi* the top; the latter were dug out of the banks of the Tiber, two hundred and fifty years ago. Each holds a prancing horse, colossal too, and yet scarcely reaching to the waist of its gigantic master. These figures, which are but of indifferent workmanship, have been styled Castor and Pollux. On a line with them are two mutilated trophies, two statues of the sons of Constantine, and lastly, at the extremities of the balustrade two milliary boundaries;^d the stone, No. I. on the Appian way, was formerly placed at the end of the first mile, but it stands now at the beginning.^e The square or *piazza*, to which the stair leads, is regularly built on three sides; the palace of the senator occupies the front, that of the *Conservatori* the right side, and the museum of antiquities the left. These buildings are also the work of Michael Angelo, and by his direction the bronze statue of Marcus Aurelius, the finest ancient equestrian statue in existence, and the only one that has been found at Rome, was placed in the middle of the square.

The tower of the senator's palace commands a vast space covered with ruins, now the *Campo Vaccino* or cow-market, formerly the *Forum Romanum*. "From this elevated station, about two hundred feet above the Forum," says Simond, "the eloquent voice of Cicero might have been heard, revealing to his assembled countrymen the conspiracies of a Cataline. He might even have been heard in the tribune of Harangues, situated on the other side of the Forum, and next to the Temple of Jupiter Stator,—taking the oath that had saved the country, and all the people repeating the same oath after him. But the gory head and hand of this saviour of his country, might have been seen from the same station, soon after nailed to the side of the same tribune, and the same people tamely looking on! Instead of contending crowds of patriots, conspirators, orators, heroes and fools, each acting his part, I only saw a few cows quietly picking up blades of grass among the ruins; beggars and monks, and asses loaded with bags of puzzolana, and a gang of galley slaves, lazily digging for antiquities under the lash of a task master."^f The gulf of Curtius may recal the patriotic devotion of a generous Roman, but it does not deserve at present the name of a pond.^g

The Antonine column,^h surmounted with a statue of St. Paul, rises near *Monte Citorio*. The tomb of Adrian on the banks of the Tiber, has become the castle of St. Angelo. The bridge which leads to it, and which bears the same name, was the ancient *Ælian* bridge,ⁱ built by Adrian; the two statues at the entrance are those of St. Peter and St. Paul, the others represent angels.

We may leave these ancient monuments, disfigured by bad taste and religious zeal, and direct our steps to the

^e Simond's Travels in Italy.

ⁱ *Pons Ælius*.

master work of modern Rome, the largest Christian temple in the world. One fault in the church of St. Peter may be mentioned; the principal front instead of resembling that of a temple, looks more like the front of a showy palace. The dimensions of the building are so great that the magnificent cupola does not seem to form any part of it, but appears like the dome of another edifice. The area in front of St. Peter's,^a is not less remarkable than the church; it is surrounded by two semicircular porticos, and terminates in an avenue that extends to the front of the building, thus forming two *piazas*, of which the total length is not less than a thousand feet. The portico is surmounted by ninety-two statues of saints, about nine or ten feet in height; the proportions of the portal accord so well with the objects which surround it, that its great size is not at first obvious, neither do the pillars appear very large, although they are not less than eight feet three inches in diameter. The dimensions of the front^b are equal to three hundred and sixty-six feet; the entrances to the church are five doors, under a portico four hundred and forty-eight feet long, and thirty-nine broad. The extremities of the portico form two vestibules, in one of which may be seen the equestrian statue of Constantine, and in the other that of Charlemagne, both of whom Rome considers its benefactors.

The form of St. Peter's is that of a Latin cross; those who enter it for the first time, are less struck with the size of the building than the profusion of mosaics and marbles; the length, however, is equal to five hundred and sixty-five feet, and the height to a hundred and thirty-six. The ornaments are so splendid as to be dazzling, and they are arranged with more ostentation than taste. It might also be urged that the light is too great; were it less vivid it would be more in unison with the purpose of the building, and more inviting to retirement and devotion; it would also harmonize better with a finely painted window^c at the upper end of the nave. The principal chapels are adorned with mosaics after the models of the great masters. An antique *Giove Capitolino* in bronze, was melted to supply materials for a colossal figure of St. Peter,^d a figure of barbarous workmanship, which has been placed in a recess. The statue is always surrounded by devout persons, who kiss with great fervour a projecting toe of the apostle, and the metal has been actually worn off a full inch, by the kisses of three hundred years.

The *Baldacchino* or famous canopy of bronze which surmounts the high altar may give the stranger an idea of the dimensions of the building. It is nearly ninety feet high,^e exceeding the height of all the palaces in Rome except one; indeed the colonnade of the Louvre at Paris is somewhat lower than the canopy, which in appearance seems a mere piece of furniture that might be pushed into a corner without being missed.^f The bronze used in constructing it, weighed one thousand six hundred and sixty-six hundred-weights,^g and the gilding cost more than 10,000*l*.^h It stands below the cupola, the most remarkable part of the building. The height of the cupola amounts to four hundred and fifty feet, and the inner diameter to a hundred and thirty. The twelve apostles are represented on the vault in mosaics, and separated by groups of angels bearing the instruments of the passion. Care has been taken in the

two most apparent parts of the church, to connect it with the memory of the saint, to whom it is consecrated. Thus, it is affirmed that the gilded balustrade placed before the high altar, covers the tomb and the body of St. Peter, situated beneath it, in a subterranean church more ancient than the Basilica. The upper end of the nave is decorated with a splendid monument,—the pulpit of St. Peter, supported by four colossal figures of St. Ambrose, St. Augustin, St. Athanasius and St. Chrysostom. According to tradition, St. Peter used to sit in the arm chair now placed in the pulpit; it is made of wood, and inlaid with gold and silver. The building was commenced in the year 1450, and finished in 1606. The sum expended on it, was equivalent to 10,291,700*l*.ⁱ

No other church in Rome can be compared with St. Peter's; many, however, are remarkable for their ornaments or antiquity. The Romans consider *San Giovanni in Fonte*,^k not only the most ancient in Rome, but in Christendom; it has also been designated the *Baptistry of Constantine*, but the emperor was not baptized there, although it is not improbable that he enriched it. To give a detailed account of the other churches in the capital of the Christian world, would be a tedious and unnecessary task; suffice it to say that their number exceeds three hundred.

But the number of palaces is still greater; their architecture has for the most part the character of solidity rather than of elegance; Vasi enumerates more than sixty-five that are worthy of being visited. There are few of them in which the emblems of poverty are not contrasted with the trappings of pride. Strangers may admire fine paintings of the Italian school, in a sumptuous hall with broken windows. "A massy gate," says Simond, "opens into the body of a palace, which is not situated in a court; the court, on the contrary, being placed within the palace, enclosing it on all sides. The stairs generally are near the gate, or under an open portico in the court, so that visitors may always alight under cover. The entrance being generally left open, it becomes in consequence a common receptacle for filth. I have heard it suggested," he continues, "that there may be something of the *Grandioso* in the squalid court of a Roman palace; an odd idea, but not perhaps wholly groundless. The noble proprietor occupies but a small part of the edifice, the rest being intended not for private comfort, but for the display of wealth and grandeur, to be enjoyed by an admiring multitude at all hours, and in their own way, which is neither very refined, nor very cleanly."

The country near Rome abounds with the remains of antiquity. Near the gate of St. Paul, the pyramid or tomb of Caius Cestius, announces the wealth of that ancient Roman by its size, and by the paintings and ornaments in the interior. At no great distance from it are the catacombs,—the burying place of unnumbered bodies, and the grotto and the fountain where Numa used to meet the nymph Egeria. It was to *Tusculum* that Cicero, Cæsar and Crassus fled from the noise and political intrigues of ancient Rome; Frascati rises near its ruins. Another Horace might write a satire on Tivoli and its dirty streets, rather than compose songs in their praise. The Roman poet could no longer recognise that Tibur which afforded him such delight, but he might still discover the remains of

TRIMONI NEAR ROME.

two temples, the one dedicated to Vesta, the other to the Sibyl; he might also admire the situation of the town, and its celebrated cascades, still worthy of his verses. A house near Veletri, the ancient *Velitrae*, a town founded by the Volsci, was sometimes the country residence of Augustus.

The Pontine marshes (*Pomptinæ Paludes*) are now more dangerous by their exhalations than in ancient times. They were traversed by the Appian Way, the work of Appius Claudius, and the first undertaking by which that part of the country was improved. They were partly drained by Augustus, Trajan erected bridges and houses, and many country seats were built there by the wealthy Romans. The causes which rendered the Maremma unhealthy, produced the same effects on the Pontine marshes. The country having been depopulated by the northern barbarians, the waters remained without an outlet, and unwholesome miasms were diffused in the atmosphere. Those who sleep in the open air, on the borders of the marshes, during the heat of summer, seldom or never awake. Several popes have attempted to drain them, and the last attempts have not been wholly useless; but to arrive at satisfactory results, requires a government possessing more resources and energy than that of Rome. The yellow complexions and swollen legs of the inhabitants proclaim the nature of the country; it has been said that the people are never free from fever, but it may be affirmed, without exaggeration, that they are subject to it several months in the year. The lower animals do not seem to suffer from the insalubrity of the air; the stags, wild boars, and buffaloes, are strong and numerous.

Ostia, a town founded by Ancus Martius, the fourth king of Rome, became an important place during the empire, from its port at the mouth of the Tiber; its trade, now insignificant, consists in salt. The insalubrity of the Pontine marshes extends to Ostia, and the cardinal, who is bishop of it, takes care to reside at Rome. Civita Vecchia, a well built town, and the only commercial port which the pope possesses on the Mediterranean, is not so unwholesome as Ostia. The pleasant town of Viterbo is situated to the east of Civita Vecchia; several popes are interred in its cathedral. Orvieto, on the banks of the Paglia, stands on a steep rock; there is a pit near it, to which mules descend and return by inclined planes; it is lighted by a hundred small windows. A number of fine basaltic columns are situated in the neighbourhood.

Spoletto, on the road that leads to Foligno, contains several remains of antiquity, among others, the ruins of a theatre, and different ancient temples; its old walls and towers were perhaps erected by Narses, who drove the Goths from the town. A fine aqueduct, five hundred feet in height, and of Gothic architecture, was probably the work of Theodoric. The industrious inhabitants in the small town of Foligno, carry on a trade in paper, waxlights, and comfits.

Perugia, near the Tiber, was an ancient Etruscan city,^a and an important place long before Rome; it resisted all the power of Hannibal. Placed on the summit of a hill, water is conveyed into it from *Monte Pacciano*, by pipes which descend into a valley, and then ascend to the height

of four hundred feet. Perugia was the birthplace of Pietro Perugino, a distinguished painter, who claims the honour of being the master of Raphael. The view from its ramparts extends over a rich and varied surface. At the distance of three leagues, on the side of a mountain, are seen aqueducts, temples and walls; they are the walls of Assisi, the native town of St. Francis, whose remains are still visited by numerous pilgrims.

We may arrive at Bologna by following the windings of the Appennines; it is the second city in the States of the Church, and the one, after Rome, that possesses the most valuable collections. The concordate of 1515^b was signed within its walls, by which Francis the First reserved to himself the nomination to the principal benefices, and granted to the pope the first year of their revenue. A great many churches are contained in the town; ^c there are besides two old towers, more inclined than the one at Pisa, which threaten destruction to the neighbouring houses. The university, the museum of natural history and antiquities, which occupies twenty-six apartments, the library, consisting of two hundred thousand volumes and many manuscripts, the observatory worthy of being visited on account of its meridian line,^d the botanical garden in which numerous exotic plants have been collected, and two scientific academies, render Bologna little inferior to the most celebrated towns in Italy.

Ferrara, a place of less importance than Bologna, is the most northern town in the States of the Church. The streets are broad and straight, and one of them is equal to two thousand yards in length.^e The most remarkable edifice is the Gothic palace, once the residence of the dukes of Ferrara. Other monuments are connected with the illustrious house of Este. The ashes of Ariosto rest in the Lyceum, and in the hospital of St. Anne, may be seen the place where, (under the pretext of madness,) Tasso was seven years confined by Alphonso duke of Ferrara.

Marine deposits have gradually filled up the harbour, which Augustus constructed at Ravenna; the town is at present two leagues distant from the sea.^f The *Rotonda*, a curious church, was constructed in order that the sarcophagus of Theodoric might be placed in it; that monument was destroyed in 1512 by the French; but the tomb of Dante, near the cloister of the Franciscans, was decorated about forty years ago by Cardinal Gonzaga. Faenza has given its name to the glazed earthen ware, which the French call *faïence*; it was the birthplace of the celebrated Torricelli. Forli need only be mentioned for its cathedral and regular streets. The town of Rimini, built on the shores of the sea, was the place where the Flaminian and Æmilian roads terminated; it contains several ancient remains, among others a fine triumphal arch erected to Augustus, and the bridge commenced by the same emperor, and finished by Tiberius. The church of San Francesco, finished in 1450, was one of the first buildings in which the Roman was substituted for the Gothic architecture. The small town of Urbino boasts of having given birth to Raphael. Ancona is seen to most advantage from the sea; it stands on the side of a hill; the citadel rises at one extremity, and

^a *Perusia*.

^b The concordate between Francis I. and Leo X. was concluded Aug. 16, 1516. The king and the pope had their interview on the subject, Dec. 11 1515. (Moreri).—P.

^c They are said to amount to 200. (Ed. Encyc.)

^d The celebrated meridian line in Bologna is traced on the pavement of the church of St. Petronius.—P.

^e "That of St. Benedict is one thousand toises in length."

^f The port is now filled up with the mud and sand thrown up by the tide, which has formed a tract of land of three miles in extent, which separates the town from the sea. (Ed. Encyc.)

the cathedral at the other. The harbour extends in the form of a semicircle ; the mole, which projects into the sea, is sixty-eight feet in height and two thousand in length ; the streets are for the most part narrow and crooked. A triumphal arch was erected to Trajan, and at a later period, another to Benedict the Fourteenth, by whom the mole and the lazaretto were constructed.

Many, who visit Ancona, are induced to extend their journey to Loretto, a small town on a hill that commands the sea. It rose into celebrity from its statue of the virgin, formerly an object of so great veneration that before the Reformation, more than two hundred thousand pilgrims came to it every year, and deposited their offerings at the feet of the image. Loretto deserves a place in the history of superstition. According to tradition, angels carried away the house of the holy virgin at Nazareth, in the year 1291, and placed it near Tersato in Dalmatia ; three years afterwards, the same angels transported the same house to the coast of Italy, and deposited it a thousand paces from the sea, in the neighbourhood of Recanati. Eight months afterwards, the house, which was solid, stationed itself a thousand paces nearer the town ; it removed next to the lands of a noble lady, called Lauretta, and fixed itself on the very spot where Loretto has been since built. The house, still adored by the people, is thirty-two feet in length, thirteen in breadth, and eighteen in height ; many imagine it to be without any foundation, and that it rests on the ground. It was formerly a mere brick building ; it is now decorated

and incrustated with Carrara marble. The cedar-wood statue of the virgin stands above the fire-place in the eastern walls ; the garments with which the priests clothe the statue, are kept in a chest ;^a one of them, a red camlet gown, is said to have been worn by Mary herself. The earthen vessels which the holy family used, are deposited in another chest ;^b the window opposite the fire-place was the one by which the angel Gabriel entered. The house, which the inhabitants call the *Casa Santa*, stands in the middle of a church, enriched with more costly treasures than any other in the world.

Only four towns of any importance are situated between Loretto and the Neapolitan frontiers, namely, Macerata rising on a hill above a fruitful plain ; Fermo with a harbour much frequented by small vessels ; Camerino with an archiepiscopal palace, a university, and silk manufactories ; lastly, Ascoli, the ancient *Asculum*, and the metropolis of a bishopric.

The popes possess besides two small territories in the kingdom of Naples. Ponte Corvo on the banks of the Carigliano, peopled by five thousand inhabitants, is the chief town of the one, and the seat of a bishopric. Benevento, the metropolis of an archbishopric, contains several fine buildings, and the *Porta Aurea*, a marble triumphal arch raised in honour of Trajan.^c The first of these territories is enclosed by the Terra di Lavoro, and the last by the Principato Ultra.

^c The *Porta aurea* forms one of the entrances of the town. (Ed. Encyc.)

BOOK CXXXVI.

EUROPE.

*Europe Continued.—Description of Italy.—Sixth Section.
Kingdom of the Two Sicilies.*

THE *Liburni*, a nation that emigrated from the Illyrian mountains, settled in the country between the Alps and the Adige, about sixteen centuries before the vulgar era; but abandoning that marshy soil, fatal to man, and difficult of culture, they advanced southward along the shores of the Adriatic, and established themselves in the region between the mouth of the Chiento and the extremity of Calabria.^a The principal branches of the *Liburni* were the *Padiculi*, the *Apuli*, and the *Calabri*. The names of some of their tribes have given rise to considerable etymological research. Court de Gebelin supposes that the *Marrucini* on the right bank of the Pescara, were so called from the words *mar* and *ru*, the former signifying high or lofty, and the latter, a stream or rivulet. The *Peligni* dwelt in the Appennines, and the word *pal* signifies an elevated place. The *Frentani*, he affirms, derived their name from the word *ren* to flow, because their country was watered by several rivers, which descend to the Adriatic, but they might perhaps have been so denominated from one of those rivers, the ancient *Fronto*, or the modern Termoli,^b in the same manner as the names of different tribes in North America were found to be the same as those of rivers or mountains. According to some writers, the name of the *Calabri* was derived from the eastern word *calab*, which signifies resin, because their country was covered with pines. The territory to the west of the *Liburni*, towards the gulf of Tarentum, was called *Messapia* or *Japygia*. Mazzocchi makes a curious remark on the subject, namely, that the oriental word *massap* signifies wind, and the Hebrew word *japah*, it blew; thus the roots from which the two ancient names have been derived, are applicable even at the present day to the nature of the country. The lands in the Appennines round the lake *Fucinus*,^c which occupies part of an elevated basin, were inhabited by the *Marsi*; their name, says Court de Gebelin, comes from *mar*, a height, and *ci*, water. They were the neighbours of the *Peligni*. The *Marsi*, the *Peligni*, the *Marrucini*, and the *Frentani*, were not numerous, but brave and warlike; they resisted for a long time the power of Rome.^d

Sannium, the country of the *Sannites*, lay on the heights and sides of the Appennines to the south of the territory inhabited by the *Marsi*. The Greek geographer considers the *Sannites* the descendants of the *Sabini*; Court de Gebelin and La Martiniere arrive at the same conclusion from the etymology of their name; they might have been first called *Sabinites*, then *Sannites*, and lastly, *Sannites*. The

cause of their separation from the *Sabini* does not appear improbable; Strabo mentions the tradition. According to the custom of the most remote antiquity, the *Sabini*, (being engaged in a war with the *Ombri*, their neighbours,) vowed to consecrate to the gods whatever was produced within their territory in the course of the year. Their efforts were crowned with success, the animals and the crops were offered a sacrifice to the gods, and a famine was the natural consequence. One of the people remarked, that in order to fulfil their vow, the children born during the year should also be included in the offering; these were accordingly devoted to the god Mars. When arrived at the age of manhood, being compelled to expatriate themselves, they followed the chain of the Appennines, and settled at twenty leagues distance from their native land. They became a warlike and numerous people, being able to put eighty thousand foot soldiers and eight thousand horsemen under arms. Long the rivals of the Romans, they were not wholly subdued, until the dictator Sylla, having vanquished them, was inhuman enough to massacre in the field of Mars, the prisoners who had been induced to surrender themselves by the conditions which he himself had proposed.

"I may mention," says Strabo, "an excellent law of the *Sannites*, one well adapted to excite men to virtue. Fathers have not the right of choosing husbands for their daughters, but judges name twenty young persons, ten of each sex, whom they consider more meritorious than the rest; the most deserving virgin becomes the wife of the most deserving young man, the next is given to the next, and so on until they are all married. But if a husband who has received a prize, changes his mode of life, or from being virtuous, becomes wicked, he is rendered infamous and his wife is taken from him."^e

Campania, a country to the east of Sannium, was celebrated in ancient times for its fertility and diversified scenery; in the same region was situated Capua, of which the luxury was as fatal to the troops of Hannibal, as the plains of Cannæ had been to the Roman legions. The hills of Falernus beyond it, were covered with vineyards, while the neighbourhood of Baia and Pozzuoli was adorned with country houses, in which the degenerate Romans indulged in effeminacy and luxury.

"Vesuvius," says Strabo, "rises above these places, and with the exception of its summit, the soil is very fruitful. The summit, however, is sterile, and in appearance not unlike a heap of ashes. It may be inferred from the cavities in iron coloured rocks, which appear to have been calcined by fire, that the mountain was formerly a volcano,

^a The extremity of Japygia (*Japygium Promontorium*, Capo di Leuca.) Encyc. Method. Géog. Anc. In ancient geography, Calabria was synonymous with Japygia. It has now a very different application.—P.

^c The modern Celano.

^d Strabo, Book V. chapter 9. ^e Strabo, Book V, chap. 10, sect. 2.

containing fiery furnaces, which were extinguished, when the materials that supplied them, were exhausted."^a It is not a little remarkable to hear the Greek geographer speak of Vesuvius, nearly in the same terms that a person of the present day would apply to the extinguished volcanoes in Auvergne. The fertility of Campania induced different people to settle in it at different periods; it was inhabited by the *Opici* and the *Ausones*, before it was conquered by the *Osci*, who were in their turn expelled by the *Cymæi*,^b a Greek tribe that emigrated from *Æolia*, twelve centuries before the vulgar era. After having built twelve towns, of which Capua was the capital, the *Cymæi* were vanquished by the Samnites, who were themselves subdued by the Romans.

Lucania extended to the south-east of Campania from the gulf of Salernum to that of Tarentum. The *Lucani*, who inhabited the country, were a colony of the Samnites. Justin, after Trógus Pompeius, gives the following account of them. "As soon as the young men among the Lucani, arrive at the age of puberty, they are put out of the towns, and sent to the woods among the shepherds; there, without assistance, without clothing, and without beds, they are early accustomed to a laborious and frugal life; they have no other food than what they kill in the chase, no other drink than the water from the stream."^c Thus, they are inured in youth to whatever is most irksome and painful in the life of a soldier." At the time of their settling in the country, the coasts of eastern Italy, as well as Sicily, were peopled with Greek colonies, and their territory received the name of *Great Greece*.^d The neighbours of the Lucani made war against those new settlers; it was always their policy to oppose their invasions on the maritime districts. It was probably that policy which led to the destruction of *Sybaris*, a town situated at the mouth of the Sybaris, now the *Cosale*.^e It appears to have been of eastern origin, at least Mentelle derives its name from the word *sheber*, which in Hebrew signifies plenty. It is remarkable that when the Sybarites had rebuilt the same place, its Greek name, at first *Thourion*, then changed by the Latins into *Thurium*, and afterwards into *Copia* by the Romans, retained always the same signification. *Thor* in Chaldean signifies an ox, the emblem of agriculture; and *Copia* conveys the same idea of abundance. The country of the Sybarites was rich and populous; it contained no fewer than twenty-five towns, and an army of thirty thousand men could be raised in the event of a war. But the wealth and effeminacy of the inhabitants were the causes of their ruin.

The territory of Calabria was called *Bretium* or *Brutium* by the ancients. According to Strabo, the *Bretii* or *Bruttii* who inhabited it, migrated from Lucania, but Court de Gebelin considers the tradition doubtful, because the name of *Bretium* appears to come from the Celtic word *bret*, a forest. The Syrian word *bruta* signifies a resinous tree; *Brutium* might therefore denote a country abounding with pines. It has been already shown that the root of the word Calabria signifies resin. Some degree of probability may be attached to these etymologies, from the fact that they correspond very exactly with the productions of the soil in different parts of southern Italy.

^a Strabo, Book V. chap. 10. sect. 1. ^b *Cumæi*, the founders of *Cumæ*.

^c "Potus, aut lactis, aut fontium liquor erat." Justin. Lib. xxiii. c. 1.

^d *Magna Græcia* — In the original, the term is applied to the coasts of Eastern Italy; but the whole southern part of Italy, comprising Apulia, Calabria (*antiqua*), Lucania, and the country of the Bruttii, was called *Magna Græcia*.—P.

Sicily was first inhabited by the *Sicani*, a people of Basque or Iberian origin, by whom the country was called *Sicania*. Conquered by the *Siculi* or *Sicili*, a Dalmatian people, that had settled in Latium, the island received the name of *Sicilia* from its new masters. The ancient kings of Sicily were denominated *tyrants*;^f they are celebrated in history by their despotism and their invasions of the coasts of Italy. After the death of Dionysius, one of these princes, the island was at different times subdued by the Greeks, the Carthaginians, the *Mamertini*, who were a tribe of the Bruttii, and, lastly, by the Romans.

The four provinces which composed what is now called the kingdom of the Two Sicilies, were devastated by the Ostrogoths after the fall of the empire. Narses subdued them in the year 553, and compelled the inhabitants to submit to the emperor at Constantinople. Thirty years afterwards, Autharis, king of Lombardy, took possession of those provinces, and founded the duchy of Benevento; Naples, Salerno, Capua and Taranto were within the dominions of its dukes.

Apulia and Calabria continued subject to the Greek emperors. In the eleventh century, some Norman gentlemen, returning from a pilgrimage to the holy land, (at that time pilgrims carried arms along with them,) remained some time at Salerno. While they resided at the court of the Lombard prince Guimar, the Saracens, then masters of Sicily, invaded the port, and exacted contribution from the prince and the inhabitants. The Normans, although much inferior in number, would not suffer infidels to plunder the town without resistance; their courage supplied them with strength, and but few of the Saracens returned to Sicily. The people, grateful to their liberators, loaded them with presents; and, after their return to Normandy, their success prompted many of their countrymen to seek wealth and fortune in Italy. An expedition was accordingly fitted out under the command of Ranulph. That chief after having rendered important services to the Greek and Lombard princes, obtained permission from them to fortify and settle in Aversa, between Naples and Capua. Ranulph's successors were surpassed in their exploits by the achievements of the sons of Tancred. Their alliance was courted by the princes of Great Greece, but the covetousness of the latter occasioned dissensions between them and the Ultramontanes. Manasses, general of the Greek troops, led an army into Sicily, but that army could not vanquish without the French, who gave signal proofs of their valour; whilst they were pursuing the Saracens in their mountains, the Greeks shared the booty taken from the enemy. The Normans deputed Ardoin, one of their chiefs, to remonstrate with their allies against so flagrant an act of injustice. The Norman was scourged, conducted round the camp, and returned covered with blood to his friends. It was difficult to restrain the impetuosity of the soldiers burning to avenge their general, or to prevent them from marching against the Greeks, but Ardoin conceived the bold project of making himself master of Apulia, and his companions seconded him with so much ardour, that the conquest was an easy one. William, surnamed the *Iron Arm*,^g eldest son of Tancred, and after him Dreux and Onfroy, his two brothers, founded several principalities; lastly,

^e Coscile.

^f The word tyrant (*τυραννος*), in its original acceptation, signified merely a prince or sovereign.—P.

^g William, surnamed *Bracchio di Ferro* (*Bras de Fer*. M.B. *Fierabras*, Moreri,) or William with the *Iron Arm*. Guthrie & Gray's Univ Hist. v. X. p. 45.—P.

Robert, the fourth of Tancred's twelve sons, and who from his great cunning was surnamed *Guiscard*, extended these conquests. Master of Apulia, Calabria, and the principalities of Salerno and Benevento, he obtained from the pope the title of duke. Roger, his brother, conquered Sicily with a handful of Normans, and took the title of count. His son Roger, heir of Robert Guiscard's dominions, forced the emperor Lothaire and Pope Innocent the Second to acknowledge him as king; his possessions comprehended almost all the territory, which forms at present the kingdom of the Two Sicilies.^a

It was thus that the Normans established themselves in southern Italy; William the Third, the last of their princes, succeeded to the throne; when too young to reign, his mother Sibylla was appointed regent. The emperor Henry the Sixth, who was related to the same family, had been nominated protector; by his instructions Sibylla was confined in prison, and he condemned her son to perpetual bondage after having deprived him of his sight and virility. Master of the throne of Naples, his ambition might have been satisfied, but his cruelty excited him to new crimes, and all the partisans of the Norman princes were destroyed. His avarice prompted him to other acts of injustice; while Richard *Cœur de Lion* was passing through his dominions, Henry confined him in prison, in order to obtain a ransom. The same emperor seized the possessions of the church, and distributed them among his favourites. The last usurpation brought upon him the thunders of the Vatican; but having been reconciled with the church, he commenced anew his cruelties in Italy with so much atrocity that his wife put herself at the head of the insurgents and confined him in a castle. Not long afterwards the empress believing her husband penitent restored him to liberty, and he was preparing to atone for his crimes by a pilgrimage to the Holy Land, when he was poisoned in 1197, bearing the surname of Cruel, which he had too well deserved. The descendants of Henry reigned at Naples until the year 1265, when the investiture was bestowed by the pope on the conqueror, who had defeated the usurper Manfred.^b

Charles of Anjou, brother of St. Louis, promised to fulfil the intentions of Rome; although it was well known that the nearest heir was alive, reports were circulated concerning his death; the accession of Charles was therefore a new usurpation; indeed he himself used to affirm that his government could only be maintained by an iron sceptre. Conradin, the grandson of Henry the Sixth, laid claim to the throne, but he was defeated and decapitated by Charles, an event that tended to increase the hatred of the Sicilians towards their new master. The severity of his government, and the French garrisons in all the towns, reminded the people of his conquest over them. The French, besides, were dangerous rivals near their wives; these and other causes led to important results. Procida, a proscribed person, conceived the bold design of liberating his country; he was supported by the pope, the Greek emperor, and the king of Arragon. Having disguised himself, he travelled through Sicily, and excited the inhabitants to revolt; the king of Arragon, not unprepared for action, had a fleet on the coast of Africa, under pretext of watching the Moors. In the year 1282, on the day before Easter, a lady of Palermo

was insulted by a Frenchman during a procession, an insult that gave rise to the revolt, which has been styled the *Sicilian vespers*. The tumult might have been soon quelled, had it not been for the conspiracy of Procida; the people rushed to arms, and massacred the French. The conspirators invited the king of Arragon and his fleet to their assistance, and proclaimed him sovereign. The consequence of that event was the separation of Naples and Sicily; the former continued under the house of Anjou until the year 1382, but in the following century, the two crowns were again united. The possession of Naples and Sicily was the occasion of many wars between France, Spain and the Empire. The Spanish branch of the house of Bourbon ruled over the two countries, until the last king fled for refuge to Sicily in 1805. Naples was first given to Joseph Buonaparte by his brother, and afterwards to Joachim Murat in 1808. The old government was restored in 1815.

San Germano, on the side of the Appennines, near the site of two ancient cities—*Casinum* and *Aquinum*, of which some ruins still remain, is the first town of any importance, on the frontiers of the *Terra di Lavoro*. Murat was defeated in 1815, near the fortress that commands San Germano. The abbot of Monte Cassino resides in the town. The abbey or convent, presenting a front of more than five hundred feet, stands on the summit of a steep mountain. A fine library and a collection of antiquities, are contained in the building. The ashes of St. Benedict, its founder, and St. Scholastica are deposited in the church. The Benedictines of Monte Cassino were formerly the proprietors and the lords of all the neighbouring lands, which now belong to the crown. Banditti infest the country round the abbey; the dead bodies suspended at different distances on the branches of trees, announce the punishment that awaits them, but do not intimidate or deter them from the commission of crimes. The Appennines in the same part of the country exhibit a peculiar aspect; snow still lingers on many heights in the month of June, exhibiting streaks of silvery whiteness, which together with the fine walnut trees, render them not unlike the Alps in Switzerland. The peasants do not inhabit the vallies, because they are unhealthy; but in summer they collect the cherries, and employ themselves in other rural labours. The reapers amuse themselves by dancing to the accompaniment of the *zampogna* or rustic flute. Eight men form a circle by taking hold of each other's hands; as many girls leap on their shoulders, and remain while the men dance, pass alternately under one another's arms and make a thousand evolutions; the girls then descend, and dance or sing in the middle of the circle; lastly, at a given signal, every man receives in his arms her whom he carried on his back. The robust appearance of the men, and the slender figures of their partners, together with the motley costume of the latter, have rather a ludicrous effect; two pieces of cloth, the one red, and the other green, encompass their waists; a silver pin binds their long black hair, which sets off their fine complexion.

It has more than once been remarked, that in proportion as nature is prodigal of her treasures, in the same ratio does man become careless and slothful. The truth of the observation may be confirmed by visiting Italy, and by comparing it with other countries. It ought not, however, to

^a Sismondi, Histoire des Républiques Italiennes. A. de la Salle, Histoire des Princes de Normandie en Sicile.

^b Urban IV. published a Crusade against Manfred (*Mainfroy*), and offered the investiture of the Sicilian crown as a reward for his expulsion. This offer was accepted by Charles of Anjou, who arrived at Rome in May

1265, and after having been solemnly crowned, invaded the kingdom of Naples. A decisive battle was fought at Benevento; the Neapolitans deserted Manfred, who was entirely defeated and killed on the field, Feb. 26, 1266.—P.

be concluded that the *far niente*,^a which distinguishes the Italian, is the effect of climate. The people have retained nothing of the activity and energy of their ancestors; it would be more correct to attribute the change to moral rather than to physical causes. Charity, so wisely enjoined by the founder of Christianity, but which when applied, must be directed with judgment by legislators and the interpreters of divine truths, has contributed not a little in countries where industry has not received the necessary impulse from government, to encourage indolence and servility, and to produce corruption and all the vices and crimes which the lower orders of society are tempted to commit. What man has visited Italy without remarking the arrogance with which the mendicant exacts the wages of his importunity? He supposes that his wretchedness gives him a right to what he implores; that notion leads to another; he considers mendicity as a trade,—a sort of industry; shame is then banished from the mind, and if the means of subsistence can be procured by alms, the people choose to beg rather than to work. A person without education and virtue, can perceive little difference between demanding as a supplicant, and exacting as a robber. It is not therefore wonderful that highway robbery should be a profession in countries where mendicity is a trade.

Beggars and bandits, the scourges of Italy, are as common in the kingdom of Naples as in the States of the Church. Between Terracina, on the frontiers of the Roman states, and Fondi, a miserable Neapolitan town inhabited by mendicants, the *banditti* have established their head quarters. Although military posts are stationed at every quarter of a league, a stranger may consider himself fortunate if he escape an attack. Scouts stationed on the rocks that command the road, apprise their chief of a traveller's approach; in a moment, these men, accustomed to descend the steepest heights, intercept the road almost within sight of the soldiers stationed to repel them. Wo to the brave traveller who offers to resist them; he may atone for his temerity with his life. To carry nothing which may excite their avarice is not always a security. The inspection of a passport or other papers suffices to indicate the profession or rank of the person to whom they belong, and he remains a hostage until the sum fixed for his ransom has been paid by a friend or correspondent. They seldom wait longer than the stipulated time for the ransom; if it does not arrive within the limited period, the prisoners are put to death. These men, inured to every sort of crime, are in many instances the fathers of families; they cultivate their fields, and obey implicitly him whom they have chosen for their chief. They wear a particular dress,—buskins or sandals attached by cords that reach to the middle of the leg, a broad girdle bound by a silver clasp, pantaloons and waistcoat of blue cloth, with buttons of the same metal, an open shirt, a conical hat encircled with different coloured ribbons, a short but loose mantle of a brown colour, and a belt, to which are suspended a sabre, a dagger, a spoon and a fork. All of them carry fire arms;^b and wear on their breast an image of the Virgin or the infant Jesus. Saint Anthony is their favourite patron; why they have chosen that peaceful hermit cannot be easily determined.

The dangers one encounters in the six leagues' stage between Terracina and Fondi, and the wretched aspect of the inhabitants, may heighten, by contrast, the beauty of the valley in which the last town is situated. The principal street stands on the Appian way. Bean fields diffuse their fragrance round the neighbouring country; the roads are lined with hedges of aloe, or with orange, lemon and cypress trees. At the sight of such profusion, a traveller may be tempted to ask, why nature has lavished these treasures on a sensual and indolent people. Historical associations give new charms to the varied and picturesque scenery, and to the fine views that, in the neighbourhood of Mola,^c are bounded by the Mediterranean. Near that town, Cicero had his country house, and on the very road by which strangers travel at present, the assassins suborned by Anthony, seized the Roman orator.

Gaeta, which rises like an amphitheatre on the shores of the sea, was the ancient *Caieta*; its harbour was repaired by Antoninus Pius, and its present walls were built by Charles the Fifth; within these walls may be seen the tomb of the Constable Bourbon, whose body was deprived of the rites of sepulture from the year 1528 to 1757, because he had been excommunicated.

Capua has nothing in common with the luxurious *Capua* of the ancients, but the name. It is situated half a league from the ancient town.^d It was founded by the Lombards in the year 856; and the streets are as dirty at present, as they were in the time of those barbarians. Caserta, which owes its origin to the same people, contains only one remarkable edifice,—the magnificent palace built in 1752 by Charles the Third of Spain. These places lead to Naples, the *Neapolis* of the Romans, and the *Parthenope* of the Greeks; the last of whom, in their brilliant fictions, attributed its foundation to the siren Parthenope, to indicate the safety of its harbour, and its maritime importance.

Naples stands on a gulf, of which the outline is equal to fifty miles in extent; the town and the suburbs are not less than eight miles in circumference. The broad quays; the castle of the Egg (*Castel dell' Uovo*) on an insulated rock; that of Saint Elmo which protrudes into the sea;^e the island of Capri, rising like a sterile rock from the water; the blackish colour of Vesuvius, which menaces the town with its destructive fires, its sides covered with the richest verdure, and dotted with white points or so many country houses; the blue mountains that terminate in the promontory of Massa; the town of *Castel a Mare*, built on the ruins of the ancient *Stabia*, near which the elder Pliny perished, while contemplating the eruption by which Pompeii was destroyed; lastly, Sorrento on the sea shore, the birth place of Tasso, form together a landscape, of which the magnificence surpasses the most gorgeous description. He who sees, for the first time, the splendid panorama unfolding itself before him, may be ready to exclaim with the Neapolitan, *Vedi Napoli e poi muori*.^f

The crowded quays announce a populous city, but to judge of Naples, one must repair to the street of Toledo.^g No street in Paris is so noisy, none exhibits so much confusion; the crowds on a Sunday are so great as to render it almost impossible for foot passengers to proceed, and yet three hundred carriages pass along it with great velocity,

and cross each other in every direction. The Tolcdo may be called a perpetual fair; the *Aquaiolo* distributes his refreshing beverage, the lazzarone sells his figs, the mountebank exhibits his wonders, and mixing the sacred with the profane, gives his hearers some notion of future bliss from the pleasure they experience in eating his macaroni. Sometimes, a funeral procession advances in the midst of the throng, with all the pomp of a triumph. The coffin is deposited in a sort of ark or chest, resplendent with gold and silver, and resting on a bier covered with crimson velvet.

The motion and the bustle which distinguish Naples, are no proofs of industry or labour. The Neapolitans agitate and torment themselves without doing any thing, as they quarrel and menace each other without ever coming to blows. It may be readily conceived that these remarks are only applicable to the lower orders, but in such classes the national character is most easily observed. The general hatred against those who hold the balance of Themis, may proceed from the conviction that the laws are unjustly administered. If a person, caught in the act of picking another's pocket, be beaten or scourged, the people approve of the correction, but if he be conducted to the tribunal, they murmur,—they are dissatisfied. If a crime has been committed, the people pity the man who has suffered from it; but if the criminal be apprehended, he then becomes an object of sympathy. Let not the reader confound in these characteristic traits, pity for the man who is justly punished, with the jealous hatred that the people bear towards the wealthy or privileged classes, who are too often suffered to commit offences with impunity. There is no town where the inhabitants make such use of their canes as at Naples; if an individual were to strike a hackney-coachman in London or Paris, he might be repaid with interest, but the hackney-coachmen of Naples submit to castigation with the greatest patience.

The Lazzaroni lead a very monotonous life. Idle from choice, and servile from indolence or want of energy, they rarely disturb the tranquillity of the town where the police does little or nothing for the public safety. They have only evinced their hostile intentions on a few great occasions, and under a government odious to every class of the community. These men who obtain as much macaroni as they can eat for three halfpence, and quench their thirst with iced water for a farthing, may easily satisfy their most urgent wants. Ice is as much an article of necessity at Naples, as bread is in temperate regions, and government takes care that the people have it at a cheap rate. It has been said that a day without ice might make the Neapolitans revolt, and there is more truth in the saying than many are apt to suppose. Mendicity assumes all its varied forms to deceive the stranger, or move the pity of the passenger; theft, too, is very common; if a person does not use great precautions, he is in continual danger of losing his watch or his handkerchief. So great is the dexterity of the pickpockets, that one might believe the ancient Parthenope had been founded by a colony of Spartans.

The revolution by which Joseph Buonaparte, and afterwards Joachim Murat, were raised to the throne of Naples, was attended with the inconvenience of removing some favourites, and of giving a new direction to royal favour. But it had the advantage of bringing forward superior men, and such as were animated with good intentions, and even the present government has profited by the useful lesson, which

the usurpation afforded. Good roads were made into remote provinces, and industry was encouraged; order was introduced into the administration, and a regular code of laws was substituted for the inextricable confusion of ill-digested and contradictory precedents; assassins were disarmed; and the revenue, although almost doubled by oppressive taxes on the rich, was at least expended among the poor and stimulated their industry. Public schools for the lower orders were established at the expense of government, and the teachers received a fixed salary of fifteen ducats a month. Although these schools were ill attended at first, the number of scholars increased gradually, and they are still increasing, for they have not yet been abolished. The rising generation among the lower orders in the town can now read and write, a degree of knowledge which is by no means common in the country. Murat, in the year 1807, established fourteen royal colleges, and appointed able professors; they were attended by six thousand students, but the number has decreased. Boys of noble or rich families are rarely sent to college; some have private tutors, or receive lessons at home from the professors of colleges; but a great many, brought up among servants, receive no education, and few instances are to be found of young men, who are devoted to literary or scientific pursuits. Of the women, comparatively few are now sent to a convent to be educated. Queen Caroline, the wife of Murat, established, at the expense of government, a seminary for young ladies of noble families, something like the one at St. Denis in France, and the present authorities keep up the institution.

Among the rich, pride and vanity are the motives of every action. Women above the lower ranks, seldom or never walk in the streets; those who cannot afford a carriage, doom themselves to perpetual imprisonment in their own houses, or only go to church with one or two poor lazzaroni, hired for the occasion, who put on an antiquated livery, and carry a book and a cushion. Good natured husbands sometimes perform the office, thinking, probably, that they cannot be recognized in the disguise of a footman, and choosing to gratify vanity at the expense of pride.^a The luxury of the rich is displayed in their horses and carriages; as to their morals, they do not think it necessary to sacrifice realities to appearances; a lady talks of her intrigues as she would of her domestic duties, and of her lovers as of her husband.

The largest and most commodious houses are situated in the Chiaja, the finest of the five suburbs that communicate with Naples. It extends westwards, and is terminated by a long quay or rather a public walk planted with orange and lemon trees, and adorned with lawns and fountains. It is there that the Farnese bull, a *chef-d'œuvre* of antiquity, has been placed; near it may be seen the bust of Tasso, for which the French erected a rotundo supported by white marble columns. The finest coffee-houses in Naples are situated in the same walk, which is crowded every evening with carriages. The different quarters of the town are embellished with fountains, and the water is supplied by an aqueduct, that extends from the base of Mount Vesuvius. All the squares in Naples, with the exception of that in front of the royal palace, are small and irregular; the dark and narrow streets near the centre of the town are lined with lofty houses; the smooth black pavement is formed by large blocks of lava from Vesuvius.

The theatre of San Carlos, which communicates with the royal palace, is more remarkable than any other from its dimensions and elegant structure. None of the palaces can be compared with the one inhabited by the sovereign. The architecture is modern; the front extends to the distance of six hundred feet, and contains twenty-two windows and three doors adorned with granite columns, which support balconies.

The cathedral is also called the *Vescovado* and the church of San Gennaro or St. Januarius, a personage held in veneration by the people, and whose blood, preserved in two small vials, excites the joy or despair of the populace according as it dissolves or remains coagulated on the nineteenth of September, the birthday of the patron saint. The church is of Gothic architecture, and it stands on the ruins of a temple consecrated to Apollo. Of the other two hundred churches in the town, there are hardly any worthy of Italy.^a

Naples, says Doctor Valentin,^b had not before the last century, a number of charitable institutions, proportionate to its population. There are at present twelve hospitals, including the hospital of Invalids, the Foundling Hospital, and the *Recluserio*. The hospital of Incurables is the largest and best kept in the town; nearly a thousand patients are confined in it, but it might contain double the number. Four clinical chairs dependant on the university are attached to the institution; the first relates to medicine, the second to surgery, the third to midwifery, and the fourth to diseases of the eye.

The industry of the Neapolitans is confined to a few manufactures, such as silk stuffs, ribbons and silk stockings; many are also employed in making macaroni and different kinds of pastry. The perfumed soaps and the musical strings of Naples are exported to different countries. The confits of the same town, particularly the *diavolini*, are said to be the best in Italy.

We have already spoken of the catacombs at Rome; those near Naples are more extensive. They occupy the cavities in a height situated to the north of the town. The galleries, cut in a sandy volcanic rock, which was worked at a very remote period, are in several places eighteen or twenty feet broad by fourteen high. These galleries were used as cemeteries during the first centuries of the Christian era.

Pompeii^c is the most interesting object of antiquity in the vicinity of Naples; it was buried by an eruption of Mount Vesuvius, the fires of which have hitherto spared Naples, although both places are situated nearly at equal distances from the mountain, the first in a westerly direction, the other towards the north.^d When the volcano which had ceased to burn, at a date anterior to the historical period, commenced anew in the year seventy-nine of the Christian era, Pompeii was overwhelmed by a deluge of ashes, water and mud. The greater number of the inhabitants had in all probability full time to escape with their most valuable effects,—a fact that may be inferred from the inconsiderable number of skeletons which have been hitherto discovered,—not one hundred in all,—and from the small quantity either of jewels or money. They might have returned after the catastrophe to collect whatever was of value, for it is very

remarkable that the lowest stratum appears to have been pierced or broken, while the upper do not. Eight strata of volcanic deposits succeed each other; from which it may be concluded that eruptions have taken place at different times in the same direction. Scoriæ and pumice, but no lava, are found among the igneous products. A modern may walk in the streets, and enter the houses of Pompeii. The high road that leads to it, is paved with huge pieces of lava, irregularly shaped, but arranged so as to fit each other, and presenting a tolerably flat surface; from the narrowness of the road, however, the wheels run constantly in the same track, which is deeply marked on the stones. The walls of the town were first cleared, and the whole circumference is now exposed to view. These walls which from certain ancient characters on many parts of them, appear to have been founded by the *Osci*, long before the foundation of Rome, are about twenty feet in perpendicular height on the outside, but they form inside an inclined plane with narrow steps for the soldiers to ascend to the top. The barracks are in a good state of preservation; they resemble a cloister for monks, being a quadrangular court with high walls and small rooms without windows, under a projecting roof supported by pillars. The indecent sketches and writings on the walls by the Roman soldiers,—the fruits of their idleness,—have excited great curiosity. The rubbish has been taken away from two theatres, an amphitheatre, and most of the houses in the town. It may be thus seen that it was customary for the ancients to write the names of the proprietors^e above the doors of the houses.

Herculaneum, buried under torrents of lava, above which a town is built,^f has only been explored in order to collect the treasures, which give so much interest to the museum in the royal palace at Portici. The excavations which were made have been since filled up, with the exception of the theatre. The town was larger and more important than Pompeii; it may be regretted that it cannot be seen.

The finest views of Naples are from the palace of Portici, and from the *Capo di Monte*, where one may count its palaces and churches, and observe the islands which rise at the entrance of its gulf, and the sea lost in the horizon. But the garden of *Camaldoli* is not less celebrated; situated on the summit of a volcanic hill twelve hundred feet in height, near a convent in which the monks are so insensible to the magic of a natural landscape, that they wonder why so many strangers visit them. The view extends towards the north, over the vast plains of Campania, bounded by the mountains of the *Abruzzi*, and Naples appears on one side between *Pozzuoli* and *Vesuvius*. From the same gardens are seen the lake of *Avernus*, no longer exhaling the noxious vapours mentioned by *Virgil*, and no longer suffocating the birds that fly above its surface; the *Solfatara*, anciently called the valley of *Phlegra*, or the *Forum Vulcani*; the lake of *Agnano*, from whose bubbling waters streams of hydrogen escape; the *Fusaro*, the *Acheron* of the poets; and lastly, *Baia*, the ancient *Baia*, of which the soil is now arid and sterile, but its enchanting sites induced *Cæsar* and *Nero* to build palaces near the temples of *Diana*, *Venus* and *Hercules*.

We may now descend from *Camaldoli*, and direct our

^f *Portici.*

steps to the hill called *Monte Pausilippo*,^a a promontory that separates Naples from the Phlegrean fields. A subterranean road, supposed to be the most ancient work of the kind, passes through the hill. "The road," says Strabo, "extends through the mountain situated between *Neapolis* (Naples) and *Dicæarchia* (Pozzuoli.) The breadth is so great, that carriages pass each other without inconvenience, and the light of day is admitted in many places by apertures, dug to a great depth from the surface of the mountain."^b The account given by the Greek geographer, is a very correct one, of the grotto of Pozzuoli,^c which is equal to eighty or ninety feet in height, to twenty-four or thirty in breadth, and to two thousand one hundred and eighty in length. The excavations were not attended with much difficulty, as the mountain is wholly composed of volcanic tufa, or peperino. Although paved, it is always covered with dust; the light enters at the two extremities, and by two apertures near the middle. The servants of the wealthy carry torches before them; but foot passengers are contented with lanterns, and the feeble glimmerings that pass through the openings. Twice a year, in October and February, the last rays of the setting sun penetrate through the long vista.

Temples, amphitheatres, and other ancient ruins, are scattered along the coast, between the subterranean passage and Cape Miseno. The small town of Pozzuoli, after having been exposed to the devastations of barbarians, was overturned in 1538 by an earthquake. The cathedral stands near the ruins of a temple dedicated to Augustus. Some parts of its ancient amphitheatre remain; but at no great distance from the town is seen the temple of Serapis, a monument worthy to fix the attention of the antiquarian and geologist. It stands on the shore, at fifteen feet above the level of the sea; it was, at a period beyond the reach of tradition, buried under volcanic ashes. About seventy years ago these deposits were removed; the pavement of the temple was uncovered, and there were found marble vessels to receive the blood of the victims, brass rings to fasten them, broken statues and columns. But what is very extraordinary, pholades had pierced those parts of the marble columns still standing, with innumerable holes, that reach to the height of five or six feet. These marine mollusca are very common in the European seas; they are bivalvular, and armed with teeth and several accessory parts, which, by a rotatory movement, penetrate the hardest calcareous rocks.^d But the marble of which the columns are formed, exhibits no other traces of these animals; it must be supposed, therefore, that the holes have been made since the catastrophe by which the temple was covered with volcanic ashes. To explain the phenomenon, it has been supposed that the sea had risen at least to the height of the marks left by the pholades. But the fallacy of such an opinion may be easily shown; in the first place, the event must have happened since the commencement of our era; secondly, several ancient towns, situated on the coasts of the Mediterranean, and Naples itself, must have been destroyed by such a cala-

mity. It is true, that during the fifteenth and sixteenth centuries, as Simond remarks, the coast of Baiæ was exposed to several volcanic shocks, and the ruins now submerged prove that the ground has sunk in many places. But if it be attempted to explain the phenomena connected with the temple of Serapis by such facts, it must be supposed, what is inadmissible,^e that the land has risen after having been once submerged, for the pavement of the temple is still higher than the level of the sea. Thus, it happens, that vague conjectures are the consequence of careless observation. When the volcanic deposits were removed, and the edifice was uncovered, a small lake, formed after the outlet of a stream had been closed by the deposits, watered its base. The lake might have become salt by the hydrochlorate of soda,^f contained in certain products of Vesuvius; and if it be supposed, what is not improbable, that the waters of the lake communicated, for some time, at least, by a subterranean passage with the sea, the presence of these pholades, and their long continuance in the lake, may be classed among the number of those physical facts, which, however extraordinary, are by no means irreconcilable with the laws of nature.

A monument, on the opposite side of Mount Posilippo, formed by a large square base, constructed of stones and bricks, on which a circular tower rises, commands the respect and admiration of travellers; it is the tomb of Virgil. The interior consists of a square and vaulted chamber, and the tomb is covered with earth, on which many shrubs grow: it is shaded by evergreen oaks, but the laurel planted by Petrarch exists no longer. The people say that the roots are still to be found—that they are immortal like the ashes of the divine poet, and that they bud, if the soil be moistened with rain, but that travellers pull the leaves as soon as they appear.

It has been seen that the small province of Naples contains many places of great celebrity. We shall now proceed to the other provinces of the kingdom. Salerno, the ancient *Salernum*, is situated in the *Citerior Principality*;^g it was fortified by the Romans, that they might be better able to control the *Picentini*, who had embraced the party of Hannibal.^h One part of the town extends along the sea shore, and the other rises in the form of an amphitheatre to the castle that commands it. The cathedral, surrounded by a portico supported by ancient pillars of porphyry, contains the tomb of Pope Gregory the Seventh, and, according to tradition, the ashes of St. Matthew the evangelist. The port, situated at the bottom of a gulf, was the most frequented on the coast before Naples rose into importance. But the celebrity of Salerno, in the eleventh century, depended principally on its school of philosophy and medicine; several precepts, which emanated from the school, were long obeyed as oracular.ⁱ The ruins of Policastro, formerly *Palæocastrum*, rise at the extremity of a gulf; near it may be seen the remains of the three temples of *Pæstum*, now Pesto; they were built by the Sybarites.

Part of the Appennines are situated in the *Uterior Prin-*

^a Posilipo, Posilippo, Pausilypo.

^c Grotto of Pausilippo.

^d Simond is mistaken in supposing that the pholades exude a chemical acid, and thus perforate the rocks in which they are found. It is known, besides, that they make holes in wood; and if their physical structure enabled them to secrete a solvent as powerful as nitric acid, it is certain that epicures would not consider them a great delicacy, or give so much for them as they do at present.

cipality.^a Avellino, its capital, was the ancient *Abellinum Hirpinorum*. The streets, though broad, are irregular; the public walks are shaded with fine trees. The produce of its territory consists in chestnuts, and in the large filbert called *avellana*, from the name of the town. The Val di Gargano occupies the site of the Caudine Forks (*Caudinæ Furculæ*;) where the Romans passed under the yoke of the Samnites. Ariano, a place of more importance than Avellino, is built at a greater height on the Appennines.

Near the summits of the same mountains, and at some distance from the last town, is situated Aquila, the metropolis of the *Second Ulterior Abruzzo*;^b it carries on a considerable trade in saffron, and four great fairs are held in it every year. The town has been more than once injured by earthquakes, and a small fort is the only part of its old fortifications that now remains. The antiquities which are contained in it, were discovered in the neighbourhood, on the site of *Amiternum*, the birthplace of the historian Salust. To the northeast, in the *First Ulterior Abruzzo*,^c Teramo rises in the middle of a plain, between the Appennines and the Adriatic Sea; it possesses some woollen manufactories, and, in proportion to its size, an extensive trade in grain. Proceeding towards the southeast, the traveller reaches the banks of the Pescara, a river which descends from the Appennines to the Adriatic, and waters near its mouth a small town, to which it has given its name. Chieti, the chief town of the *Citerior Abruzzo*,^d stands on its right bank; it is pleasantly situated, well built, and contains several fine edifices, among others a cathedral, and a very large seminary. It was the chief town of the *Marrucini*, and the *Teate* of the Romans, from which the *Theatines*, a celebrated religious order, have derived their name. The order of the *Theatines* was founded in 1524, by Caraffa, the archbishop of the town, who was afterwards Pope Paul the Fourth. Lanciano carries on a considerable trade in muscadine wine.

Campobasso, once famous for its cutlery, is situated in the province of *Molise*.^e The adjoining province of *Capitanata* forms the greater part of Apulia.^f It is divided in the direction of southwest to northeast, by a chain of calcareous heights, that terminates at Mount Gargano (*Garganus Mons*;) their declivities and the surrounding hills form a large promontory on the Adriatic. The summits are covered with forests, in which are collected, as in ancient times, manna, turpentine and pitch. A large sandy plain extends on the south of the chain to the sea. The port of Manfredonia is the most important harbour in the province, although large vessels cannot enter it. The town was built in 1256 by Manfred, who gave it his name. Foggia, the chief town of the *Capitanata*, was destroyed by an earthquake in 1732, but it has been rebuilt with elegance and regularity. The *Candelaro*, which flows beneath its walls, facilitates its trade in grain. The people have long been in the habit of preserving their corn in vaulted and subterranean magazines, buildings not unlike the ancient *silos*.

Near the limits of the *Terra di Bari*, not far from the banks of the Ofanto,^g is situated the *Campo di Sangue*, or field of blood; it is there that the famous battle of Cannæ

was fought. The village of Cannæ, on the right of the river, stands on the site of the ancient Cannæ. The town of Canosa, the ancient *Canusium*, founded by Diomedes, was destroyed by an earthquake, in 1694. The pope had a palace there, and the emperor Henry the Fourth stood at its gate during three days, in the winter of 1077, imploring pardon from Gregory the Seventh, by whom he had been excommunicated.

The *Terra di Bari*, a province destitute of wood, but abounding in salt, forms part of the ancient Apulia. Altamura, the largest town beyond the Appennine chain, which traverses the province, contains sixteen thousand inhabitants. If Bitonto be excepted, a place that carries on a great trade in an excellent wine, called *zagarello*, the principal towns on the eastern side of the mountains are situated on the sea coast. Trani, one of them, forms an enclosure round its harbour, which scarcely contains sufficient water for ordinary boats. It is related, that in 1502, a time when people talked more of national glory than at present, eleven Frenchmen, and as many Spaniards, fought under the walls of Trani, to support the respective honour of the two countries. The combat continued until six of the Spaniards remained against four of the Frenchmen, when the latter dismounted and defended themselves behind their horses, until night put an end to the contest, and left the victory undecided. Barletta, another sea port, about two leagues to the northwest of Trani, was founded by one of the Norman chiefs who conquered Apulia. Several moles serve to protect the harbour against the billows, and an ancient citadel may defend the town in the event of a foreign attack. Bari, the chief town of the province, was thrice destroyed, and as often rebuilt; but its narrow and crooked streets, and the absence of any thing like a fine building hardly entitle it to its rank as capital. It possesses a harbour which, although small, offers a safe asylum for ships.

The *Terra di Otranto*, a continuation of the *Terra di Bari*, forms what the ancient geographers called the heel of the Italian boot. *Brundisium*, now Brindisi, was the port in which Julius Cæsar blockaded his antagonist Pompey, who made a passage for himself through the midst of the besiegers, and fled for safety to Greece. The town has been much injured by earthquakes, and the harbour was destroyed in the fifteenth century, by a method which the prince of Taranto adopted, in order to close the entrance against the Venetian fleet. Several vessels were sunk at its mouth;^h the sands and other deposits being thus arrested, were consequently accumulated, and the port, thus changed into an unwholesome marsh, engenders every summer pestilential diseases, by which the population has been reduced to a third of what it was formerly. The town does not contain at present more than six thousand inhabitants. Lecce, between Brindisi and Otranto, at three leagues distance from the sea, is not only the capital, but the finest and largest town in the province; its inhabitants are held in the same repute at Naples, that the Bœotians were at Athens. The valley that separates Lecce from Otranto, has been called the paradise of the country. The small sea-port town that has given its name to the province,

stands on the site of the ancient *Hydruntum*, which received, with the benefits of civilization, the first lessons in philosophy from Pythagoras.^a

Gallipoli, the first port in the gulf of Taranto, after passing Cape Leuca, owes its activity to its tunny fisheries and its manufactures, the last of which consist principally in cotton stockings and muslin. Taranto, the ancient *Tarentum*, situated at the northern extremity of the gulf, was in ancient times a place of great importance; Strabo commends its fine and spacious harbour, but at present the town only occupies the site of the ancient citadel, in which the Romans resisted Hannibal. It was principally from the gulf of Taranto that the ancients obtained the molusca that supplied them with their purple. A cavity below the neck of the animal is filled with the liquid that yields the colour; but the quantity contained in each cavity is so small, as to account for the excessive price which the ancients gave for the dye. Taranto has given its name to the tarantula (*Lycosa tarentula*), an insect well known from the fables concerning the effects of its sting. It was long believed that those who were stung by it exhibited very different symptoms; some laughed, others wept; one person was mournful and silent, another continued singing from morning till evening; many were seized with drowsiness, others could not be prevented from dancing: music was found to be the most effectual remedy for all. The sting of the tarantula, although not without danger, yields readily to different remedies. The animal, a species of spider, is of a black colour, with red and black streaks on the abdomen;^b it is about an inch in length. The web of the tarantula serves only to envelope its eggs, and to line the cell which it digs in the earth. It feeds on different insects, and lies frequently in ambush for them near the entrance of its den. It often makes excursions into the fields, and sometimes into the houses, but it always carries its prey home. "The eggs of the same animal," says an able naturalist,^c "are like the seeds of the white poppy; when they are hatched, the mother tears open the covering which incloses them, and carries her young on her back, until they are able to provide for themselves. The male and female are only seen together at the season of coition; at other times they kill each other. It is not easy to make it leave its cell; but if it be once dislodged, and return afterwards, it allows itself to be destroyed, rather than be removed a second time."

Potenza, the capital of the *Basilicata*, is situated at the foot of the Appennines. The same town, and Matera, at twelve leagues from it towards the southeast, although ill peopled, are the most important in the province, which derived its name in the tenth century from Basil the Second, emperor of the east, who conferred, probably, some privileges on the inhabitants. It is at present one of the poorest provinces in the kingdom of Naples.

Mount Pollino separates Basilicata from the two provinces of Calabria—provinces destitute of important towns, and inhabited by a poor and wretched people. Bathed on the east, the west, and the south by the sea, and traversed by a branch of the Appennines, the two Calabrias are indented with large gulfs, cooled by the sea breeze, and wa-

tered by heavy dews, and by springs and rivers, which increase the fertility of a black and rich soil. *Citerior Calabria*^d terminates at Mount Calistro, and at the banks of the Neto.^e Cosenza, the capital, is situated at the confluence of the Crati and the Bussento;^f the streets are narrow and crooked, with the exception of one large street, which traverses the town; it possesses, however, several useful establishments, such as hospitals, a college and two academies, besides a fine cathedral and a palace of justice, edifices which strangers are surprised to see in so small a town. The only other important towns in the province are Cassano, Rossano, Bisignano and Cariati, none of which possesses any remarkable edifice, and the most populous of which contains hardly nine thousand inhabitants. The making of olive oil is almost the only kind of industry in which the inhabitants of Rossano are engaged, and the sale of it constitutes the principal branch of commerce. Bisignano is noted for its silk worms, and the best manna in Calabria is produced in the neighbourhood of Cariati.

More important towns are situated in *Uterior Calabria*,^g some of which were celebrated in ancient times. The walls of the famous *Crotona* are seen on the eastern coast, and its ruins encompass the modern town of Cotrone. Crotona, rich and populous, could recruit an army of a hundred thousand combatants within its walls and its territory; Cotrone contains hardly six thousand souls. Not to mention the robust Milo, it is known that the inhabitants of Crotona were renowned, the men for their symmetry and strength, the women for their beauty; but their descendants have greatly degenerated. Crotona contained many fine edifices; its gymnastic games, and the schools of philosophy founded by Pythagoras, rendered it the first of the Greek colonies; Cotrone contains at present six churches, two hospitals, two convents, and a seminary, but no buildings worthy of notice. Catanzaro, although possessing little or no trade,^h contains a greater population than Cotrone.

Pizzo is situated on the western side of the Appennines, on the gulf of Saint Eufemia. Joachim Murat landed at its little harbour on the eighth of October, 1815, and attempted to regain his throne. Taken prisoner and ill treated by those who had long acknowledged him as their king, condemned as a common malefactor, and interred in the very church which he had rebuilt, his death may be considered not only as one of the catastrophes which result from political revolutions, but as a characteristic trait of a people, who afterwards showed themselves incapable of enjoying the institutions which they apparently desired.

The wretched town of Gierace, built on the ruins of the second *Locri*, and at some distance from the ancient city of the Locri, does not contain four thousand inhabitants. Bova, a still smaller town, was destroyed by the earthquake in 1783, and afterwards rebuilt and improved by Ferdinand the Fourth.

The country in the neighbourhood of Reggio abounds with figs and ananas, and the town is the capital of Uterior Calabria; the inhabitants carry on a considerable trade in the essence of citron, orange and bergamot. As a town,

Reggio is nowise remarkable ; its name indicates its position on the site of the ancient *Rhegium*, once, according to Strabo, a powerful city, but afterwards wholly destroyed by Dionysius the elder. The tyrants of Syracuse were dreaded on the coasts of Italy. The inhabitants of Rhegium formed a league against Dionysius ; but when hostilities had ceased, and a peace had been concluded, the tyrant declared to the magistrates that he intended to choose a wife among the daughters of the most distinguished families in Rhegium ; the latter not wishing an alliance with their enemy, answered that they could only give him *the daughter of the executioner*.^a Indignant at such an answer, Dionysius laid siege to the town, and after a series of cruelties, the details of which are mentioned by Diodorus Siculus, his vengeance was so complete that, notwithstanding all the efforts of Dionysius the younger, the place could never be restored to its ancient splendour. The city which was built on its ruins fell at a later period under the power of the Romans. It was destroyed by an earthquake, and rebuilt by Cæsar, whence it was called *Rhegium Julii*. Barbarossa reduced it to ashes in 1543 ; between that period and the year 1593, it was twice pillaged by the Turks, and injured by earthquakes ; but the one which happened in 1783 was attended with more disastrous consequences than any other. That formidable earthquake, by which all Calabria was devastated, was so extraordinary both from its duration and effects, that it may be proper to give some account of it.

The first shocks were felt about noon on the fifth of February, and were renewed at short intervals during several months. They were not preceded by any of the ordinary indications, and in a few minutes all the plains in Ulterior Calabria were laid waste. Those who witnessed the frightful calamity, declared that the oscillations were so frequent and so violent that nothing could resist them,—neither the works of nature, nor the most solid works of man. Edifices were overturned, and their fragments thrown to a distance. The materials of the small town of Sciglio, built on the promontory of Scylla, overwhelmed two thousand seven hundred persons that had fled to the coast for refuge. The ruins of villages rolled from the hills. Some of the mountains opened, others sunk, and the upheaved earth formed new heights. In one part, the plains were changed into lakes, and their waters covered the harvests ; in another, rivers issued from their beds, and changed the direction of their course. Movements similar to the undulations of waves were seen on the land. Masses of earth in different places were raised into the air and fell, as if they had been blown up by gunpowder. On some parts of the coast, the sea rose above its ordinary limits, and many who ran for safety to the shore or to their vessels were destroyed. Some pressed the expiring bodies of their friends, and in a few seconds shared their fate. Lovers rushed into the gulf that had swallowed up the object of their affections ; mothers, recalled to life by the care and good offices of relatives, sought their children amidst the ruins of their houses, and were buried with them in the same grave. More than three hundred towns or villages were destroyed in the two Calabrias, and most of the places that have been already mentioned, were much injured ; forty thousand individuals perished, and twenty-thousand were the victims of contagious diseases, occasioned perhaps by putrid carcasses in

stagnant water, or under the ruins and rubbish of buildings. To add to the misfortunes of the people, the fires, left in the houses, communicated with the combustible materials, and the flames destroyed what the earthquake had spared. Lastly, the little that remained was seized by banditti, who, in the general consternation, massacred the inhabitants, and carried off whatever was of value. The inhumanity and intrepidity of these men, who rushed from several parts of Italy into Calabria, cannot be considered extraordinary by persons acquainted with the character of the Neapolitan bandits. But several examples of courage and disinterestedness might be mentioned to the honour of the Calabrians and the rest of the nation. The inhabitants of districts far removed from the scene of these calamities, rivalled each other in mitigating the misfortunes of an impoverished people ; the custom-house officers of Naples and the Lazzaroni employed in loading the vessels which conveyed the supplies sent by government to Calabria, refused to receive any reward for their services.

Earthquakes are not the only evils to which the two Calabrias are exposed ; there are others which are periodical, such as the blast of the sirocco, which prevailing four months in the year, produces diseases and destroys vegetation, and the miasms rising from the stagnant waters in summer, which compel the inhabitants to leave the low plains and to reside on the mountains.

The vegetation of the two Calabrian provinces varies according to the exposure of the soil. The grape might yield excellent wine, if the inhabitants bestowed any care on its culture. The echinated liquorice (*Glycyrrhiza echinata*), a variety not inferior to the Spanish kind,^b grows naturally ; and the leaves of the mulberry nourish an immense number of silk worms. The olive, a tree that may be seen almost in every part of Calabria, produces so much oil that the inhabitants keep it in large cisterns ; the maniferous ash (*Fraxinus rotundifolia*), indigenous to these provinces, grows without culture in the plains and on all the hills ;^c it is during the greatest heat of summer that it yields the concrete juice so useful in medicine ; the palm, the cotton plant, and the sugar-cane flourish. The fruits of the orange and the lemon tree add to the amount of the exports, and the different kinds of grain are sufficient for the wants of the inhabitants. Larches and other resinous trees afford great quantities of pitch ; the *Bretian* pitch, which was considered very valuable by the ancients, was obtained from the forest of Sila, on the summits of the Appennines, which, according to Strabo, was seven hundred stadia or twenty-three leagues in length. The thick leaved aloe crowns the arid rocks ; the rose laurel shades the banks of the rivers, and mingles its flowers and its foliage with the leaves of the *arrundinaria*, a sort of grass that is converted into cordage, mats, nets and baskets.

Spirited horses, large and hardy mules, numerous herds and flocks, and woods abounding with game and wild buffaloes, may be enumerated among the natural advantages of the two Calabrias. The ancients said that the dews of the evening renewed the grass which the cattle had browsed during the day,—a metaphor not so improbable, as those who live in northern latitudes might be apt to suppose.

The natural riches of the country are increased by the fish that are taken on the coast ; the tunny fisheries are the

^a Strabo, Book 6. chap. 11.

^b “— which is used for the same purposes as the officinal liquorice (*Glycyrrhiza glabra*).”

^c “Dans tous les bois et sur le penchant des collines.”—The manna ash grows spontaneously on the lower parts of the mountains. (E. J. Encyc.)

most profitable; the sword-fish (*Xiphias gladius*) serves as food to the Calabrians. The last animal has derived its name from a hard or bony substance that extends from its muzzle, and with which it defends itself against its enemies. The sword-fish grows to the length of eighteen or twenty feet, and weighs sometimes four hundred pounds. It is difficult, and even dangerous to take it, on account of its great activity, and the weapon with which it is armed; it often breaks the nets of the fishermen, who are obliged to harpoon it. The corals that line the bays are valuable from their fine colour; and the fishermen take the *Pinna nobilis*, the largest of the bivalvular mollusca, furnished with the long red silk, that the people at Reggio weave into different stuffs of admirable delicacy.

The Calabrians delight in idleness; the *far niente* has more charms to them than to the other Italians; wearing loose mantles like the Spaniards, they resemble the same people in their black eyes and dark complexion. Suspicious and vindictive, a Calabrian seldom leaves his house without being armed. Tall or strong men and handsome women are equally rare in the province; the latter marry at an early age, and soon lose their looks. Notwithstanding the great number of marriages, and the fruitfulness of the women, the country is ill-peopled, and the cause may partly be attributed to the custom of relatives marrying with each other; the inhabitants of almost every village and of many small towns in Calabria are so many kinsmen and kinswomen. The children, it is known, are unhealthy, and the consanguinity of the parents may tend to perpetuate diseases. The dowry of a peasant girl consists in a small piece of ground, in a part of a vineyard, or even sometimes in a single mulberry tree. Little has been done to improve the condition of the peasantry; most of them are small farmers or day labourers; the land is divided among the nobles, the clergy, and some burgesses, who let it on short leases. Thus, it happens that agriculture is still in a very imperfect state, and that a fruitful soil nourishes a poor and sickly population, scattered in wretched hovels, in dirty villages, or deserted towns.

We had occasion, in treating of Hungary, to make some remarks on a people of uncertain origin, who in that country are called *Zigeunes*; the same people are found in Calabria, where they are styled *Zingari*. They are distinguished from a poor population by their greater poverty, and by their squalid appearance and dress. The men shave their beards, but suffer their hair to grow; they gain a subsistence by buying and selling horses, and by working iron; many of them are conjurors; they collect crowds in the public places, and perform their different feats with great skill and address. The women wander about the country, and live by pilfering, or telling fortunes. Without any fixed habitation, living under tents, where men, women, children, and animals are crowded together, they form a distinct people from the other inhabitants; they marry only among themselves. According to travellers, the *Zingari* are more ignorant and dissolute than the Calabrians; all of them can speak Italian, but many words in their own dialect indicate its eastern origin. Their religion is a compound of Christianity and different superstitions; they admit the divinity of Jesus Christ, but they have no veneration

for the Virgin. As to marriages, funerals, and baptisms, they conform readily to Catholic ceremonies, but if the clergymen refuse to celebrate them, the *Zingari* have no scruples in substituting other rites which were probably derived from paganism.^a

A distance of a hundred and ten leagues forms the greatest length of the continental provinces in the kingdom of Naples; their mean breadth varies from twenty to thirty, but they are upwards of seventy in some parts.^b

A phenomenon similar to the mirage in the deserts of Africa, and one that can only be accounted for by the refraction of light, has sometimes been observed on the coasts of the strait, which separates Reggio from Messina. A few minutes before the sun issues from the waves in summer, a spectator on the shores of Sicily, looking in the direction of Reggio, may see forests, towers and palaces in the air, the whole forming a panorama of Messina, its hills, woods and houses. If a spectator on the Italian coast, looks towards Messina, he sees also in the clouds the image of a city similar to Reggio. The illusion has hitherto been imperfectly explained; it would be less extraordinary, if a person saw the town that bounded the horizon, instead of the one near which he was placed. The phenomenon has given rise to the following fable in Calabria and Sicily, for the people have inherited from the Greeks, the love of marvellous and brilliant fictions. The *Fata Morgana*, a powerful fairy, rules over the Strait of Messina; she displays her aerial palaces to mariners, that they may be shipwrecked on the rocks where the modern Circe waits to destroy them.

Sicily possesses more than two hundred and thirty leagues of coast, and several important harbours, such as Messina, Palermo, Syracuse and Catania. It is divided into seven *intendancies*, and twenty-three districts. It was once the country of the arts; such was its prosperity in ancient times, that the inhabitants in the single town of Syracuse were almost as numerous as the whole present population. The same island, during the zenith of Napoleon's power, was the only state in Europe governed by a prince of the house of Bourbon. It retained its feudal customs with the parliament of the *Three Arms (Tre Bracci)*,^c until Lord William Bentinck, the English ambassador, induced his Sicilian majesty to grant his subjects a representative government framed after the model of the British constitution. "The advantages of the new system," says the Count Fedor de Karaczay,^d "must ere long have been felt by every class of the community. The privileged classes were to be put on an equality with the others, in order that they might contribute to the prosperity of the country. The epoch of the hundred days, the treaty of Paris, and the defeat of Murat by the Austrians, enabled Ferdinand to regain the throne of Naples. The selfish and limited notions of the Sicilian barons,—the ancient feudal proprietors, were carried into effect. It was thought that the times of the three *bracci* were to return, and with the parliament, the feudal rights. All the nobles united to overturn the constitution, but they little imagined that they were to gain nothing by the change. The constitution was indeed abolished by a decree published at Messina, but the privileges of the nobles have not been restored. Ferdinand the First took the title of king of the Two Sicilies on the eighth of December, 1816,

^a There are several colonies of Albanians in Calabria, who still retain their language, and some few of whom adhere to the Greek church.—P.

^b "Their greatest breadth is 70 leagues."

^c The Parliament before its reformation in 1810, was composed of three

branches, viz. 229 nobles, 66 prelates, and 43 deputies from cities, universities and crown estates. (Ed. Encyc.)—P.

^d Manuel du Voyageur en Sicile, published in French at Gotha 1826

and Sicily was declared a province of the kingdom.^a The nobles acknowledge their errors while it is too late to correct them; taught by the past, they may not perhaps be again so easily deceived."

While a Frenchman reigned over Naples, the Sicilians possessed a considerable inland trade, and Palermo was the residence of a king and a numerous court; but the Sicilians are now governed by the lieutenant of a viceroy, and the circulating medium, attracted to Naples, is daily becoming more scarce in the island. No manufacturing industry tends to bring back the money, which the Sicilian courtiers spend at Naples. Different objects of luxury, muslins, linens and other articles, are imported from England or France, and in order to satisfy factitious but urgent wants, the island furnishes only raw materials, of which the production affords employment to but a small number of hands. The most important of these materials are raw silk, averaging one year with another, not less than £180,000;^b different sorts of wines, among others those of Syracuse and Marsala,^c of which the quantity exported to Boston exceeds two thousand pipes, and the value £39,000;^d grain to the amount of £372,000,^e a quantity much less considerable than in ancient times, when Sicily and Sardinia were called the *granaries of the Roman people*; fruits that are sold for £80,000;^f olive oil, equal in value to £84,000;^g soda, of which great quantities are exported to Marseilles; and the produce of the tunny fisheries, yielding £15,000.^h Sicily carries on, besides, a trade in mercury, sulphur, alum, nitre and rock salt. Such are the only sources of wealth, and they may be mentioned to the disgrace rather than to the credit of the Sicilian government. Although there is not a more fertile soil in Europe, not a fourth part of the surface is cultivated; treasures are contained in the depths of the earth, but its gold, silver, copper, iron and lead mines have been long neglected. The gypsum, with which Sicily abounds, might be used in building, or as a manure, and it might even form an article of exportation, but the inhabitants derive no advantage from it.

If agriculture, industry and commerce were encouraged, Sicily might contain, as in the time of the Romans, three times the number of its present population. But many obstacles must be removed before it can attain such a degree of prosperity; the nobility must show an example of disinterestedness, that can hardly be expected from their character and habits. The indolent and slothful would suffer from the change, and the number of monks would be diminished. There are no manufactories in the island, but it would be of advantage to establish some in the different convents, as their number is out of all proportion with that of the inhabitants. Twenty-eight thousand monks and eighteen thousand nuns, in all forty-six thousand, are contained in a population of one million six hundred and fifty thousand individuals, which gives one recluse for every thirty-five inhabitants. The secular clergy might not perhaps be averse to such a reform, for they are said to be tolerant, from which it may be inferred that they are enlightened and well informed. They possess a third part of the land, but their influence depends as much on their knowledge as on their wealth. The nobles, still more wealthy, possess almost

all the rest of the country; they are composed of a hundred and twenty princes, eighty dukes, a hundred and forty marquises, thirty counts, three hundred and sixty barons, and a great many knights, who are also included in the aristocracy. The abolition of their privileges has tended to diminish their revenue, but they may imitate the Russian nobles, and add to their riches by building manufactories, and encouraging agriculture, which might be done without difficulty in a country where nature invites man to labour by repaying him a hundredfold.

Sicily, from its situation between Europe and Africa, might easily be rendered the most commercial island in the Mediterranean; but before such a change can take place, good roads must be substituted for rugged and inconvenient paths: so long as there is no other roadⁱ in the island than the one between Montreale and Alcamo, the difficulties of communication are likely to prevent every improvement in agriculture. Lands yield less than four per cent. to the proprietor; he advances the seed to the farmer, who returns it after harvest, and pays his rent in produce, according to the rates that are determined in every parish.

While an eternal winter reigns on the summit of Etna, the rest of Sicily enjoys a perpetual spring. In April, Reaumur's thermometer stands at about seventeen degrees in the shade at noon, but when the sirocco blows, the same thermometer rises to thirty-five or thirty-six degrees. The other southern winds, or the *Libeccio*^k from the southwest, and the *Austral*^l from the south, are more or less accompanied with the unwholesome effects of the sirocco. The months of November and December are mild; people seek the shade in January; but the cold winds of March compel the Sicilians to have recourse to their portable fires.^m

The Sicilian wheat grows to an extraordinary height; the ears seldom contain less than sixty grains; both the grains and the straw are of a golden or bright yellow colour, by which it may be distinguished from the wheat of northern countries. The finest crops in France or England present to the Sicilian the image of sterility, so much do his own exhibit that of abundance. The aloe rises to the height of thirty feet; most of the roads are lined with the *Cactus opuntia*,ⁿ and its purple fruit, in shape not unlike a fig, serves as food for the poor. The water melons are perhaps finer than in any other country in Europe. The fruits of the date tree arrive at maturity; their sweet juice forms a seasoning for certain dishes, or they are dried, and served on the tables of the wealthy and the burgesses. The pomegranate, brought from Carthage into Italy by the Romans, who gave it the name of *punica*, yields a vinous and acid juice, very agreeable to the people in the south of Europe. The sugar cane is indigenous to the coast opposite Africa, and the coffee shrub has been discovered in a wild state in the same part of the island. So great a variety of plants in addition to those of northern climates, might tempt the indolent Sicilian to bestow more attention on agriculture.

Messina is situated nearer the Calabrian coast than any other town in Sicily. It was founded, according to the common opinion, ten centuries before the vulgar era. The Siculi, says Thucydides, called it *Zanclé*, from a word in

their language which signified a scythe or pruning hook, probably on account of the crooked form of its harbour.^a Three or four centuries after its foundation, Anaxilas, the chief of the Messenian colony at Reggio, defeated the *Zanclai*, took possession of their town, and gave it the name of *Messana* or *Messene*. It was taken at a later period by the *Mamertini*, a people of Campania. The town was wholly destroyed by the earthquake that happened in 1783; it has since been rebuilt according to a regular plan, but although it has been declared a free port, it is not so important as it once was: it contained before the last catastrophe, more than a hundred thousand inhabitants; the present population is about seventy thousand.^b It rises in the form of an amphitheatre at the base of the mountains, the branches of which extend throughout the island, forming in our opinion the continuation of the Appennines. The sides of these heights are intersected by ravines; they are covered with a thousand varied plants, that rise above the palaces of Messina. The agitated waters of the strait, where Scylla and Charybdis were the terror of ancient navigators, are seen under the walls of the city. Built on uneven ground, Messina is about six thousand yards in extent;^c a promontory of rocks and sand protrudes in the form of a semicircle on the right, and forms a safe and spacious anchorage for ships. A large citadel, together with several forts and batteries, defends the entrance into its harbour, which may be considered one of the finest in the Mediterranean. The streets are broad and regular, and paved with large pieces of lava. The well built quays are lined with low houses, probably that less danger may accrue in the event of earthquakes. Four or five large but irregular squares or *piazas* may be remarked rather for the profusion than the taste or selection of their ornaments; they are all decorated with marble fountains and bronze statues of ordinary workmanship. The royal palace, in point of architecture, the finest building in the town, is not yet finished. The churches may vie with others in Italy, in the number of their paintings and images, which are placed together without much judgment. The cathedral built by Count Roger, is decorated with twenty-six columns of Egyptian granite, and they have a very singular effect near Gothic ornaments of the twelfth century. The people are ill educated in Messina; few among the lower orders can read, and still fewer among the nobles are well informed. The different places of education are a royal college and six gratuitous schools, two of which are reserved for young nobles; there are besides a seminary for four hundred pupils, and forty-six convents for men or women. Among other institutions, may be mentioned a bank, several mounts of piety,^d a lazaretto and a large hospital.^e

Taormina stands on a hill near the shore, about twelve

leagues to the south-west of Messina. Although not peopled by more than three thousand inhabitants, it contains a great many churches and convents. The Roman way that leads to it, and the vast remains of a theatre, prove it to be the *Taurominium* of the Romans, formerly a considerable town, which Arabs and earthquakes have destroyed. The edifice already mentioned, the most remarkable of any in Taormina, is more than two hundred feet in diameter, and it serves to give the moderns a correct idea of ancient theatres; although of so great dimensions, the space allotted to the actors was only a few feet in depth, not more than the space in modern theatres between the curtain and the orchestra.^f The sculptures that adorned the theatre, now decorate the monasteries in Taormina; their profane origin was no protection against the pious zeal of the Norman princes.

The river Cantara, which still retains the name of *Alcantara*, given it by the Arabs, separates the plain below Taormina from the last declivities of Etna or *Gibello*,^g the latter a name also of Arabic origin, and one that signifies a mountain. A pyramidal rock forms the summit of the great volcano, of which the crater is more than a league in circumference, and seven hundred feet in depth. Many strangers visit the mountain, but few ever reach its frozen summit, so much do the difficulties and dangers increase after having passed the first region of snow.^h Not many years ago an English traveller, who reached the crater, was rash enough to descend it by means of ropes attached to his waist; he was drawn up suffocated, after having given the signal to his guides, but they were unable to restore him to life.ⁱ The lava and scoræ of Etna are as useful in fertilizing the ground as the same substances on Vesuvius; thus, the base of Etna, which some writers consider equal to a hundred leagues in circumference, affords the means of subsistence to a hundred and eighty thousand inhabitants. The plants in the same part of Sicily reach to an extraordinary size; near the volcanic promontory of Aci, a place connected with the fable of Acis and Galatæa, old chestnut trees, the silent witnesses of political revolutions and natural convulsions, extend to a great distance their wide spreading branches. One of them is twenty-four feet in diameter,^k another is fifteen, but the most remarkable of any, and one that many consider a sufficient inducement for strangers to go out of their way to examine, is the *Castagno dei cento cavalli*, not an inaccurate designation, for according to Simond, a hundred horses may find shelter under its shade;^l the circumference is not less than a hundred and twelve feet.^m

Catania, the ancient *Catana*, is situated at the foot of Etna, on the sea-shore; it was founded seven centuries before the vulgar era, but it has been often destroyed by lava

^a Strabo adopts the opinion of Thucydides: see book vi. chap. 3. § 5. Thus, it might be easy to prove the Greek origin of the Siculi, for the Greek word ζαγκλη, which is pronounced *zanclæ*, signifies also a scythe or pruning hook.

^b Between eighty and ninety thousand. Ed. Encyc. c "3000 toises."

^d "Three mounts of piety." ^e The public hospital.

^f "L'avant-scène." ^g It. *Monte Gibello, Mongibello*.

^h The silence of Homer concerning the fires of Etna, render it probable that it was in the same inactive state in his time, as Vesuvius was in the time of Strabo. The number of its eruptions from the earliest period of history to the present day amounts to eighty-one; namely,

^k "24 feet in one direction, and 12 in another."

^l "— and in its interior."(?) The trunk, near the ground, separates into five great divisions, forming a large cavity, and appearing as if five trees had grown into one.—P. ^m Simond's Travels in Italy.

and earthquakes, and it does not cover at present more than a fourth part of the surface which it occupied when Hiero, tyrant of Syracuse, changed its name into Etna, and peopled it with new inhabitants. The town is large and well built: its fine edifices, which render it not unlike Turin, are so many proofs, not of its prosperity, but rather of its misfortunes; for in Catania, houses never become old, they give way either to lava or volcanic shocks. It is to the earthquakes of 1693 and 1783, that it owes its magnificence; almost wholly destroyed, it was rebuilt with greater regularity. Most of its edifices have been since injured by the shocks in 1819. The cathedral is one of the finest; the walls of the sacristy are covered with fresco paintings, which represent the ravages of the eruption in 1669; during that period, a torrent of lava, a league in breadth, was accumulated behind the walls of the town, which were more than sixty feet high, but the burning stream flowed over them into Catania, traversed the city, and formed a lofty mole in the sea, which adds at present to the safety of the harbour. The people, however, are persuaded that the town owes its preservation to St. Agatha, the tutelar saint of Catania, who suffered martyrdom in the same place under the reign of Decius. It is true that they attribute to their own sins, the misfortunes which the protection of the saint cannot avert. The convent or rather palace of the Benedictines, forms a striking contrast, by its magnificent architecture, with the simplicity that is so well adapted to a house of devotion. The monastery may be considered a museum of the antiquities that have been discovered in the neighbourhood; it possesses, besides several valuable paintings, a collection of natural history, a large library, and gardens made at much expense on a bed of lava. A great many antiquities are contained in the Biscari museum, which was founded by an opulent nobleman of the same name, who employed his wealth in exploring or digging for antiquities in the territory of Catania. The ancient theatre and amphitheatre, the old walls, baths and temples were buried under several layers of lava and alluvial deposits, that were removed by the same individual; lastly, the town is indebted to him for several ancient statues, and a basaltic elephant carrying an Egyptian obelisk on its back. Although the religious houses in Catania are richly endowed, sufficient funds are not wanting for the university. The professors are distinguished by their attainments, and their classes are attended by five hundred students; those among the nobles, who are educated in the same institution, are in general well informed. A convent in the town, serves as a residence for the knights of Malta, whose predecessors were for a long time the terror of the Crescent.

The territory of Catania produces plenty of corn, wine, flax, olives and silk. Much amber, and some pieces of a bright red colour, are collected on the coast near the mouth of the Giaretta, formerly the Simæthus,—a river celebrated by the ancient poets. These products maintain the industry and commerce of the town; the inhabitants carry on a trade in olive oil; some manufacture linen and silk stuffs,

while others are employed in making amber crosses and chaplets.

The road from Catania to Syracuse is not nearly so pleasant as the one from Messina to Catania; indeed the former extends along the sands on the sea-shore. But the Phrygian bonnet, still worn by the inhabitants, recalls some associations not without interest, and the traveller passes through a country embellished by the brilliant fictions of the Greeks. The banks of the Simæthus are still covered with the fragrant flowers, which Proserpine was gathering, when she was carried away by Pluto,—the god of hell and of Etna, who shared with her his empire.

The fountain of Arethusa issues from a rock near the ancient Syracuse, which the Greeks called *Pentapolis* from its five quarters; the fountain serves to recal the story of the nymph Arethusa, flying from Alpheus, but her metamorphosis availed her little, for the ancients pretended that the Alpheus passed under the sea, and united his streams with the fountain—a notion sufficiently poetical, but contrary to physical geography, by which the impossibility of such a communication may be easily demonstrated.^a The fountain, which Cicero describes as of very great magnitude, and abounding in fish,^b can no longer be recognised; it is, at present, only a small and narrow stream, where the women of modern Syracuse are employed in washing clothes. The modern town scarcely occupies one of the suburbs of the ancient city; the latter did not long survive the decline of Athens. Modern Syracuse is built on the island that the ancients called *Nasos*; the circumference of the town, including the large and small harbour, is hardly equal to a league, while that of the ancient city amounted to nearly eight. Some idea may be formed of its great population in past times, from the extent of its catacombs; they are situated in the plain where the old church of St. John stands at present, and they are cut in a sort of sandy limestone. Long and regular galleries, extending in every direction, are interrupted at different distances by large circular halls, covered with stucco, and open at the roof so as to admit the light and air. Niches and tombs are hollowed in the sides, and in some of them twenty coffins, placed one above another, were found, and pieces of money, the fare for the ferryman of Acheron, have been observed near several skeletons.^c It was in the same place that Cicero discovered the tomb of Archimedes.^d One may still trace the enclosure or outer wall which Dionysius built round the town, and examine the remains of a large theatre and amphitheatre, cut in the rock. The celebrated prison, called *the Ear of Dionysius*, is not a building, but a cavern, perhaps the quarry out of which old Syracuse was built;^e its form is most favourable to the repercussion of sound, high, narrow, pointed above, and presenting a singular curve in its horizontal depth. It is so sonorous that Dionysius might have placed himself near the opening above it, and heard whatever the prisoners said in a whisper. The tearing of a piece of paper makes a noise not unlike that occasioned by knocking a heavy stick

^a Strabo refutes triumphantly the common opinion that existed in his time, concerning the junction of the Alpheus and Arethusa. Book VI. Chap. iii. sect. 5.

^b *Incredibili magnitudine et plenissimus piscium.*

^c "The piece of money, intended as the fare &c., was observed in the mouth of several skeletons." A small coin (*triens* vel *abalus*) was put in the mouth of the deceased, that he might give it to Charon for his freight. [Adam's Antiq. p. 515.]

— nec habet, quem porrigat, ore trien tem.—Juvenal, Sat. iii. v. 267.—P.

^d This is not in the original. The tomb of Archimedes was found by Cicero near one of the gates of Syracuse, (*est enim ad portas Agrogianas magna frequentia sepulchrorum.*) overgrown with thorns and brambles. It could not, therefore, have been in the catacombs.—P.

^e This is not in the original. The perpendicular height of the Ear of Dionysius is about 90 feet (58 feet M. B.) and its length 250 feet (Brydone)—scarcely large enough to supply materials for such a city as ancient Syracuse. The *Latomie*, an extensive quarry, now converted into a garden, is better entitled to that distinction.—P.

against a stone, some notion may thus be formed of the effect produced by the discharge of a pistol, an experiment with which the *ciceroni* are not unwilling to gratify strangers.

Modern Syracuse has been much injured by earthquakes; the one that happened in 1693, did not last more than four minutes, but it destroyed almost all the houses, and a fourth part of the inhabitants. Although now an insignificant town, it possesses a theatre and a very valuable museum, in which may be seen a statue of Venus Callipygia, supposed to be the one described by Athenæus, and given to the Syracusans by the emperor Heliogabalus. The cathedral is the ancient temple of Minerva; it was transformed into a church towards the end of the second century; its most precious ornament is a Madonna of solid silver, as large as life; the lady appears in a robe, covered with diamonds and other precious stones, on certain solemn occasions, such as the day of an annual visit which she makes, in procession and with much ceremony, to another Madonna in the neighbourhood.

Mount Laura, which rises to the west of Syracuse, is one of the highest points in the three chains that traverse Sicily. Calatagirone, an industrious and commercial town, is situated on the southern side of the mountains, at a considerable elevation; the inhabitants are engaged in commerce, agriculture and the useful arts. It contains many churches and priests, convents and monks, besides a royal college and several hospitals. Two or three fairs are held every year in the town; and according to different authors, the population amounts to nineteen thousand six hundred inhabitants, but it is not improbable that the number has been overrated. It stands on the site of *Hybla Minima* or *Heræa*, as it is called in the Itinerary of Antonine. A bad road passes through Calatagirone from Catania to Castro-Giovanni, a town of eleven thousand souls, which from its position on a hill, and from some remains of antiquity, was probably the ancient *Enna*, a place mentioned by Strabo; within its walls, about a hundred and fifty years before the Christian era, a number of revolted slaves maintained a long and obstinate siege against the Romans. The neighbouring country was and is still very fruitful in corn. Ceres had a magnificent temple in the town, which is said to have been the capital of her dominions; at no great distance from it may be seen the grotto, by which Pluto returned to the infernal regions, when he carried away Proserpine.

A road from Castro-Giovanni leads to Girgenti, but by following the course of the Salso, one may reach Alicata, a town of twelve thousand inhabitants, situated on the sea coast; it is protected by two forts, and well known in Sicily for its pastry and macaroni. The harbour, although small, is much frequented, and the ruins on Mount Serrato in the neighbourhood, are, according to some antiquaries, the remains of *Gela*, the birthplace of the poet Apollodorus, of the philosopher Timagoras and the tyrant Gelon. At a short distance from the same place stood the tomb of *Æschylus*.

Girgenti, of which the streets rise like steps one above another, on one of the highest mountains near the coast, is a dirty, ill-built and by no means commercial town.

It possesses an orphan hospital, a lyceum with a library and a collection of medals, an episcopal palace, and a seminary; it contains also forty-six churches and fifteen monasteries, although its population does not exceed fifteen thousand souls. It rises on the site of the citadel, that *Dædalus* built at the request of king *Cocalus*, to defend *Agrirentum*. The ruins of the ancient city are situated about a mile and a half to the south-east, at a place called *Girgenti Vecchio*. Several convents rise within its enclosure, which consisted of rocks cut in the form of walls. *Agrirentum*, which Strabo calls *Acragas*, from the name of the stream that watered it, was founded six hundred years before the vulgar era; *Amilcar* destroyed it two hundred years afterwards; having been rebuilt, it was taken by the Romans. The population amounted to two hundred thousand souls, and it was a considerable town, at comparatively so late a period as the year 941, when the Arabs or Saracens laid it in ruins. If the inhabitants were unable to resist their enemies, it was owing to their luxury and effeminacy. The long tyranny of *Phalaris*, and his cruel and dreadful tortures, compelled them at last to shake off the yoke. While Carthage was in its splendour, the people of *Agrirentum* were menaced with an attack from that naval power. The magistrates decreed that the citizens in rotation should watch the ramparts during the night, and in order that the service might not be attended with too much inconvenience, every man on duty was permitted to have a tent, a woollen coverlet and two pillows. But even this indulgence was not sufficient to satisfy the citizens, and the decree occasioned much discontent. The philosopher *Empedocles*, who perished in the crater of *Etna*, was born at *Agrirentum*; he said that his countrymen indulged in luxury as if they were to die the next day, and erected temples and edifices as if they were to live for ever. The public buildings were magnificent; strangers admire the temple of Concord, which, with the exception of the roof, is still entire; among the other ruins that exist at present, are the temples of *Castor* and *Pollux*, *Juno Lucina*, the Olympian *Jupiter*, *Ceres* and *Proserpine*, *Hercules*, *Apollo*, *Diana*, and *Æsculapius*.

It is unnecessary to mention the towns in the interior of Sicily; all the industry of the country is concentrated in the different places on the coast, and it is there too that the stranger finds subjects for meditation, in the historical recollections connected with them. *Timoleon*, at the head of six thousand Syracusans, defeated an army of seventy thousand Carthaginians, near the *Calatabellota*, a river twelve leagues in length, to which the ancients gave the name of *Crimisus*. An arid plain beyond it,^a extends to the sea-shore, where the town of *Sciaccia* rises; its wretched appearance is so much the more remarkable as it contains twelve thousand inhabitants, and because great quantities of grain are exported to foreign countries from its harbour. Few vestiges of the town called the Baths of *Selinus* (*Thermæ Selinuntia*,) now remain;^b a town celebrated in ancient times for its warm springs, for its fine earthen ware, incorrectly denominated Etruscan, and also as being the birth-place of *Agathocles*, who from a potter, rose by his talents to the throne of Syracuse. *Selinus*^c was situa-

^a In the original,—"beyond the Platani and the Calatabellota." The translator appears to have considered the two names as belonging to the same river, but they are in fact two distinct rivers entering the sea on the western coast between Girgenti and Sciaccia, the Platani on the south,

nearest Girgenti, and the Calatabellota on the north, near Sciaccia. The mistake of the translator is corrected in this edition.—P.

^b It occupied the site of Sciaccia.

^c *Selinuns*.

ted in the territory of Castel Vetrano on the right bank of the Beliefi, but the ruins of ancient temples and other edifices, that the inhabitants call the *Giants' Pillars* (*Pilieri dei Giganti*), are all that remain of the ancient town. The tempest, says a traveller,^a sometimes sweeps away the deposits that now cover the port of Selinus, and reveals for a few moments, quays, columns and rings, which the billows conceal anew under heaps of moveable sand. Innumerable lizards sport about the ruins, the aloe sends up its tapering shoot, and the wide spreading opuntia covers them with its shade. A deserted but fruitful plain extends beyond them to Mazzara, a town peopled by eight thousand inhabitants. Marsala is situated on the other side of a hill, near the sea-shore; the neighbouring country is famous for its wines;^b the plants were originally imported from Madeira. The town stands near the ruins of *Lilybæum*, a Carthaginian city that maintained a five years seige against the Romans, and in which the latter, according to Livy, kept a garrison of ten thousand men after the ruin of Carthage. Trapani, an agreeable town to the north of Marsala, stands on a peninsula at no great distance from the site of the ancient *Drepanum*. The islands of Favignana, Levanzo and Maretimo may be seen from its ramparts. It was near these islands that the consul Claudius Pulcher was defeated in a naval engagement by the Carthaginians; before the engagement, the consul ordered the sacred chickens to be thrown into the sea, exclaiming—let them drink, if they will not eat; on the same coast, Caius Lutatius gained a victory over the same people, which enabled the Romans to make themselves masters of Sicily.

The sterile country between Trapani and Alcamo may render the stranger better prepared to contemplate one of the finest monuments of antiquity—the only remains of *Ægesta* or *Segesta*. It stands on a height at the base of Mount Eryx, celebrated in ancient times for the temple of Venus Erycina, which was deserted and almost in ruins at so early a period as the time of Strabo.^c All the travellers who have examined the temple are unanimous in its commendation. The effect it produced at a distance, says Simond, increased as I approached. Such is the magic of its proportions, and the beauty of its form, that whatever side it may be viewed, it is equally admirable. It has braved the influence of time,—the edifice stands entire, columns, entablature, pediment, all except the cella and roof, which have disappeared. The columns of the Ionic order are about seven feet in diameter at the base, tapering towards the top, and only four diameters in height, but they form with the front^d a total height of fifty-eight feet. The dimensions of the interior are about a hundred and seventy-four feet by seventy-two;^e six pillars support the front, and fourteen each of the sides.^f

The country round Alcamo is fruitful and romantic; the name of the town indicates its Arabian origin; it was founded in the year 828, by Alkamah, a Saracen prince. When seen from the heights that rise above it,^g its towers and its walls give it the appearance of a Moorish town. The women have preserved the eastern costume; they never walk the streets without being covered with a large black mantle,

that conceals part of the face. The town contains thirteen thousand inhabitants, and most of them adore their Madonna, which has already performed unnumbered miracles; indeed the people maintain that there is not a better Madonna in all Sicily.

Montreale or *Morreale*, a town of eight thousand inhabitants, is also situated on a hill. The church and the convent of the Benedictines, which were founded in the twelfth century by the Norman prince William the Good, have served as a nucleus for the town; houses have at different periods been grouped around them. The abbot of the monastery has the title and the rank of an archbishop; the monks of Mount Cassino form his chapter. The church was much injured by a fire in 1811; its principal entrance is formed by a bronze portal covered with reliefs; the columns are of granite, the walls are incrustated with mosaics, and the pavement consists of porphyry and different coloured marbles; within the same building are contained the mausoleums of William the Good, and of his father William the Bad. The convent is adorned with an admirable painting by Pietro Novelli, the Sicilian Raphael.

An excellent road leads from Montreale to Palermo; country houses are scattered in the neighbourhood, and arid rocks, rising apparently from the sea, are heaped above each other in a fruitful valley, covered in some places with the spiry aloe and the cactus. Palm trees and tall bamboos wave their verdant tops in the air, and the light breeze that sweeps over the corn fields, agitates the undulating surface. The bright foliage of the orange and lemon trees, the smooth branches of the olive, the large-leaved vine and the graceful rose laurel, form a varied landscape of the richest verdure.

Palermo, the capital of Sicily, and the ancient *Panormus*, town founded by the Phœnicians, is encompassed with walls, and rises in the form of a circle on a gulf. It appears smaller than it really is; two streets which intersect each other transversely, divide it into four nearly equal parts.^h The breadth of these streets is about forty or forty-five feet, and the length from twelve hundred to fourteen hundred paces. One of these streets, the Cassaro, derives its name from the Arabic word *Cassar*, which signifies a palace; the other is called the Macqueda or Strada Nuova. The place where the two streets cross each other, forms an octagonal square; at no great distance from it, is situated the Pretorian square, which is much larger. A fountain loaded with ornaments, and of such dimensions that the eye cannot embrace the whole,ⁱ rises in the centre of the last mentioned square; it consists of several basins placed above each other, and separated by galleries covered with statues and animals, that throw out the water in different directions. The piazza of Bologni is adorned with an equestrian statue of Charles the Fifth, king of Sicily,—the best work of Volsi, a Sicilian sculptor. The gates of the town are shut at night; the two finest are the *Porta Felice*, a triumphal arch that forms the entrance from the harbour into Palermo, and the *Porta Nuova* at the extremity of the Cassaro, and contiguous to the royal palace. The architecture of the latter building is by no means creditable to

the good taste of the Palermitans ; constructed at different periods, the different parts are not in harmony with each other. The most remarkable part of the edifice is the chapel built by king Roger in 1129 ; and it too is only remarkable for its grotesque paintings,^a its coarse mosaics, and an architecture in which the Gothic and the Græcian style of the middle ages are united. The highest part of the palace, or the observatory, was finished in 1791 ; it was there that the celebrated Abbé Piazzzi discovered in 1801, the planet which he called Ceres. The oldest fresco painting in Europe may be seen on the walls of the great hospital ; it was painted in the fourth century ;^b the triumph of Death forms the subject, one that cannot be very consolatory to the patients who are confined in the hospital.

The Vicaria or palace of justice, is at once the tribunal and the prison ; the guilty and innocent, criminals and accused, are confined together, and remain sometimes ten or fifteen years before the court condemns or acquits them. "I shall give an example," says Simond, "of the manner in which the prisons are filled, as I am sure of the fact. A few months ago, two men were quarrelling in the street with knives in their hands, when a third person interfering, was stabbed, and the murderers fled. The *sbirri*, who happened to be at hand, seized three of the bystanders, and conducted them to prison, where they are now detained, without any evidence whatsoever against them ; and unless they have powerful friends or money, they may remain there half their lives. In the meantime, no measures have been taken to bring the real murderers to justice." An epidemy lately carried off eighty individuals in confinement. The original cause of detention, often trifling, is forgotten, witnesses are gone away, nobody thinks of prosecuting ; it is hopeless for a prisoner to expect a trial ; he may look forward to a gaol delivery, to which an arbitrary government has sometimes recourse, when the prisons are too full. The indifference as to the fate of prisoners, encourages the powerful to persecute and oppress the poor. The number of prisoners^c amounted to about seventeen hundred in the year 1818. The prisons in a district nine times more populous than the province of Palermo, namely, those under the jurisdiction of the royal court at Paris, did not contain at the same period more than thirteen or fourteen hundred persons.

Several articles of considerable value have lately been added to the museums of antiquities and medals ; and the paintings, which are now collecting in the galleries of the university, are likely to be of use to those who devote themselves to the fine arts. Two edifices of Moorish architecture are situated in the suburbs of Palermo ; the one is the palace of Ziza, the property of an individual, and the other, the palace of Cuba, which has been changed into barracks for cavalry ; they were built by an emir, who called them after the names of his two daughters. The town contains, besides the buildings already mentioned, twenty-seven principal churches and several others of a smaller size, sixty-seven, convents, five hospitals, eight charity schools, a seminary, three public libraries, four barracks, two theatres, and two mounts of piety. The *Duomo* or cathedral, one of the finest Gothic monuments in Sicily, was founded in the year 1166 ; it may bear a comparison with the most magnificent buildings in Cordova and Granada, but the interior, although profusely adorned, does not correspond with

the exterior ; marble, granite, jasper, porphyry, alabaster and lapis lazuli are lavished in the same way as in other Italian churches. Next to the cathedral, the church of Jesus is the most remarkable, not only for its architecture, but for its precious ornaments, its paintings and its basso relievos.

The catacombs cut in the rock below the church of the Capuchins, possess the singular property of converting into mummies the bodies that are deposited in them. The dead, placed upright in niches, are sumptuously attired ; their arms hang downwards, or are crossed on the breast. The nobles attach much importance, to this method of sepulture, and purchase very dearly the right of obtaining it ; indeed, the revenue that the Capuchins thus derive, forms the principal source of their wealth. On certain festivals, these bodies are clothed in gorgeous apparel ; relatives, friends, perhaps lovers, are then admitted to see those who were dear to them. But the magnificent dresses of the dead form surely a painful contrast with their shrivelled skin,—the contracted lip no longer concealing the teeth,—the disagreeable grimace on some countenances,—the smile on others, as if they looked in pity or contempt on the vain grandeur and fleeting pleasures of the world.

Palermo boasts of having been the birthplace of St. Agatha, who received the palm of martyrdom in the third century ; the same town claims the honour of having given birth to another personage in the legend, to another object of veneration to a credulous people. A Sicilian poet places St. Rosalia above all the saints in paradise, nay more, above the Virgin herself. According to tradition, she was the niece of William the Good ; at fifteen years of age, she renounced the world, and lived in complete solitude ; she withdrew to the mountains on the west of Palermo, where she died unknown. While the plague depopulated the town in 1624, a hermit declared that he had seen a vision, in which God revealed to him a cavern on Mount Pelegrino, where the bones of St. Rosalia were to be found ; these bones it was necessary to carry in procession round the walls of Palermo, in order that their sacred virtue might drive away the plague. No one, until that period, ever heard of St. Rosalia ; no one knew that such a person ever existed. It was rather too much to expect that her remains could be found five centuries after her death. The magistrates paid little attention to the story of the visionary, but the people believed it, and to satisfy them, a deputation of monks, with the hermit at their head, was sent to the cavern. The bones were found, and the plague in the course of time disappeared. The remains of St. Rosalia are now enclosed in a magnificent shrine on the very spot from which they were first removed, and to which pilgrims from Italy and every part of Sicily resort.

A festival that commences on the fifteenth of July, lasts several days, and those who have seen it, affirm that there is a greater display of pomp and pageantry on these occasions, than during the holy week at Rome. The shrine of St. Rosalia is then carried in procession through the streets of Palermo. Fifty-six mules richly caparisoned are attached to an immense vehicle seventy feet long, thirty broad, and eighty high, containing a numerous orchestra, and adorned with orange trees, shrubs and flowers. The holy chariot,^d if it may be so called, terminates in a dome, supported by six Corinthian pillars, and beneath it is placed the gigantic statue of St. Rosalia, which consists of massive

^a Arabesques."

silver. The saint with her numerous suite and her guard of cavalry, return home in the evening, when every house is illuminated, and when every priest or monk that accompanies her, holds a lighted torch in his hand. Fire works are then discharged from every part of the town, and the *corso*^a is crowded with carriages from midnight until two o'clock. Horse races commence on the morning of the second day; in the forenoon, the saint and her retinue pass through different parts of the town, and in the evening the same illuminations are renewed, and the fire works are more brilliant; the same amusements are continued during the third day. There are three races on the fourth, and the cathedral is lighted in the evening with thirty thousand wax tapers. Lastly, the saint is accompanied with a very numerous procession on the fifth day, for all the priests and monks in the town must attend; they pass round the Pretorian square, and the fountain is changed in an instant into a fountain of fire. The festival attracts to Palermo nearly a fourth part of the population of the island, and costs the municipality about sixty thousand ducats. The interest that the Palermians of all ranks and all ages take in the vain show, the luxury that prevails, and the importance attached to trifles, seem to indicate that the blood of the ancient Greeks, who were so devoted to ceremonies and religious festivals, flows still in the veins of the Sicilian people.^b

The Marina is the finest public walk in Palermo; it extends along the sea-shore, and leads to the Flora, a large garden tastefully planted, which communicates in its turn with a botanical garden, containing upwards of four thousand exotic plants. The fine edifice in the centre of the last garden, the work of a French architect,^c is now set apart for lectures on botany and natural history.

The Gulf of Palermo cannot be compared with the Gulf of Naples; mountains scorched by a burning sun, proclaim the vicinity of Africa. Mount Pelegrino, the *Eveta* of the Romans, is the highest of the different mountains that rise like an amphitheatre round the town; their sides are adorned with gardens and country houses, in the midst of which may be remarked the *Favorita*, a royal park, stocked with an innumerable quantity of hares and pheasants. The position assigned in the Itinerary of Antonine, to *Hyccara*, a small town mentioned by Thucydides and Plutarch, and the birth-place of Lais, the celebrated courtesan, is sufficient to prove that the present village of Carini stands on its site. The wretched town of Termini, well known in Sicily for a wealthy convent of Benedictines, built by pope St. Gregory, is situated on the coast near the site of *Himera*, a town founded six hundred and fifty years before the Christian era, by a colony sent from Messina or Zancle. Gelon defeated Amilcar under its walls, but his defeat was avenged by Hannibal, who razed the town, and put its inhabitants to the sword. The other towns and villages on the coast, are too insignificant to require notice. Melazzo,^d built on a promontory at eight leagues from Messina, is the ancient *Mylæ*, where the Romans gained the first naval victory over the Carthaginians.

The islands round Sicily may now be mentioned in order to complete the account of the Neapolitan states. Opidolo, the chief town in Pentellaria, an island on the south-

west, contains three thousand five hundred inhabitants. The town of Santa Maria; a place defended by a fortress, contains the greater part of the population in Ustica, which lies to the north of the Gulf of Palermo. Felicudi contains eight hundred individuals. Aliendi or Alicuri, an island somewhat smaller than the last, does not contain more than two hundred and fifty. Salina, which has been already mentioned, is peopled by four thousand inhabitants. The population of Lipari amounts to eighteen thousand; the town of the same name is fortified, and the island produces excellent malmsey wine. Two hundred inhabitants reside in Panaria, the ancient *Didyme*. Stromboli is the ancient *Strongyle*; its fruitful and volcanic soil did not contain more than two hundred inhabitants about twenty-five years ago, but at present, more than two thousand are collected in a single town. The other islands dependent on Sicily, are not inhabited.

The climate of Sicily exerts its influence, not only on the physical, but moral character of its inhabitants. The Sicilians are gay, lively and intellectual, of ardent imaginations and impetuous passions; the same people are generous, hospitable and faithful observers of their word. But neither are their good qualities improved, nor their bad passions subdued by education. A man commits murder, not from covetousness, but from vengeance. To avenge one's self is by all considered a right, by many a duty. The lower orders in Sicily do not submit to injuries so tamely as the people of Naples; the higher classes never venture to strike their inferiors; a blow, says Simond, might be repaid with a stab. Although they pass their time in indolence, their mental activity puts them in possession of many resources; indeed if they were well educated, they might perhaps be superior to the people of any other country. But they are kept in ignorance; influential men consider knowledge a fatal or dangerous present; it is supposed to make the people discontented; they have not yet learnt that the object of general education is not so much to teach the sciences, as to inculcate the moral truths, that are so closely connected with those of religion. Elementary education, by diffusing the use of writing, might introduce a love of order and economy among the lower ranks, enable them to profit by the perusal of the books within their reach, dispose them to consider their engagements to the state, and their other duties, more obligatory, and render the husbandman and the artisan better able to inform themselves in their respective departments of industry. What danger can result from such changes in the manners and habits of the people? The bulwarks that defend the palace against popular tumults, are not impregnable; a well informed person capable of respecting the laws, may be more easily kept within the limits of a reasonable obedience, than another who knows only the sovereignty of force, and the submission that results from fear.

We have attempted to describe the fondness of the people for religious festivals. The Sicilians require a worship that addresses itself to the senses; they must have flowers, perfumes, noisy music and images; incapable of receiving Christianity in its native purity, they introduced the machinery of polytheism into the religion of Jesus. The national vanity, which is common to the Sicilians with their

not in the forenoon as in the translation. No fire works are mentioned on the 2d day, but in the evening of the 3d. In these points the original agrees with Brydone.—P.

^c M. Dufourny.

^d Milazzo.

^a The *corso* is the procession of carriages in the Cassaro.
^b The description in the text differs in many particulars from the original, which corresponds very nearly with the description in Brydone's Tour. In the original it is stated that the great car enters the city in the evening of the 1st day, and that the procession is renewed in the evening of the 2d,

ancestors, makes them suppose themselves superior to other people, and the same sentiment produces some degree of jealousy between the different towns. Athens and Lacedæmon claimed political supremacy, and Messina does not yield to Palermo the title of capital.

The Sicilians are exemplary for their sobriety; in that virtue, at least, they are not inferior to the ancient Spartans. Some customs of the Greeks are still preserved among the peasantry; thus, the shepherds choose a judge to hear their songs, and to award the prize to him who deserves it. The country women retain a part of the Greek costume, such as the long veil and the wide cineture.

Conversazioni are as general in Sicily as in Italy; people meet in each others houses, or in public places to which they subscribe; in the latter, rooms are set apart for the purpose of conversation, and other apartments for those who consider gambling more attractive. But what appears very strange, a lady in confinement never fails to hold a *conversazione*, and, the day after delivery, all her friends repair to her chamber. The pains by which women purchase the pleasure of being mothers, are not felt in Sicily, an advantage that nature has bestowed on warm climates.

Sicily has given birth to several distinguished writers; and their works form frequently a subject for criticism or conversation to the present Sicilians. Poetry is the language of love and gallantry; there is not a tender swain that does not express the cruelty of his mistress in rhyme. Amorous intrigues are the pastimes of all the ladies; they never walk the streets; they are only seen in the theatre, at mass, or in their houses. They adopt, and often improve the French fashions, and they are perhaps as adroit as the Parisian ladies in heightening the effect of fine features and arch eyes. The women of Messina are pleasant and agreeable in their manners, at Palermo they are handsome, at Syracuse they are distinguished by the freshness of their complexion, and at Trapani, one may discover the regularity of the Greek profile. In Naples the men are handsomer than the women; in Sicily the women are better looking than the men.

The principal sources of public corruption are an inextricable labyrinth of laws, and a host of advocates and attorneys, encouraging, more than anywhere else, the mania for lawsuits. Justice is venal, and the judges do not blush to acknowledge it; the agents of government are the greatest smugglers; monks educate youth and govern families, while their own conduct is not more exemplary than that of their predecessors in the sixteenth century.

Sicily was formerly as much infested with robbers as the Neapolitan territory is at present, and some parts in the island were emphatically styled dens of thieves. Such, however, is no longer the case, for strangers may travel without danger, from one end of the country to the other, Resolute *Capitanos*, appointed in each district, are chosen from the most influential proprietors. Each *Capitano* has a guard of fourteen horsemen, well mounted, well armed, and well paid, and it is the duty of their chief to enforce the law in his district, preserve the peace, and ensure the safety of the inhabitants, for which he is made responsible. The horsemen were originally selected from the most intrepid banditti, and they have performed their duty so well that travelling is as safe in Sicily as in England.

Strangers have some difficulty in understanding the man-

ner of computing time in Sicily and in every part of Italy, except Turin, Parma and Florence. The first hour of the twenty-four, or the *Ave Maria*,^a begins half an hour after sunset; therefore, at the equinox, what is twelve o'clock at noon in the rest of Europe, is thirty minutes after seventeen in Italy, and it is one o'clock on the same day and in the same country at half past seven in the evening. One inconvenience attending the Italian method, is that the clocks must be regulated every day at noon, and advanced or retarded according as the days are becoming longer or shorter. The watches of the Italians are made in foreign countries, and the dials do not correspond with their mode of counting the hours, which they however maintain, has many advantages over the ordinary method.

Italy, once the country of flourishing colonies, the centre of the most formidable empire in ancient times, the theatre of the most powerful republics during the middle ages, has remained without influence and without glory, during the political changes to which Europe has in modern times been exposed. Divided into kingdoms and principalities of the second and third order, it is without any central point, every part is consequently vulnerable. During the last fourteen centuries, Italy has been an object of ambition to the princes beyond the Alps, and late events have too clearly proved that its different states may easily become the prey of an ambitious monarch. One or two victories enabled Napoleon to make himself master of the country. Had he secured its independence by giving it a chief, in place of dividing it into prefectures, governed under his influence by princes of his family, France and Italy might have resisted the coalition of Europe. Napoleon acknowledged his error, when it could not be repaired; what that emperor did not attempt, time and the interests of Europe may perhaps accomplish. The influence of manners, religion and language, tends to unite all the people in Italy; the intrigues of some princes, and the ambition of different powers, have hitherto prevented the union. The successive conquests of the greatest empire in Europe, may at no distant period occasion reasonable alarm for the safety of the western nations; in the event of any such calamity, it might be well to secure the independence of Italy. Additional resources might be obtained in the alliance of a country possessing on a surface of 97,200 square miles,^b a population of 16,560,000 individuals. But if commerce and industry were encouraged, Italy might easily contain twenty-four millions, so great are the fertility of the soil, and the advantages of its climate. The Italian nation is defended by the Alps on the north, by the Appennines in the centre, and in other directions by the sea; it might add to the natural strength of its position by fortresses, strongholds and arsenals; it might maintain an imposing army, enlarge its ports, create a navy, avail itself of its islands to acquire a maritime superiority, and thus be raised to an equality with the greatest nations in Europe. One of the present thrones in Italy may probably govern the whole country; but if the different states be excited to revolt by local interests or unforeseen causes, Italy may become a federative republic; Milan, Venice, Florence, Rome, Naples, Cagliari and Palermo might then be the six principal towns in the New United States,—participating perhaps at the extremity of the European continent, in the wealth and prosperity that distinguish the American federation.

^a The *Ave Maria* is twenty-four o'clock.

^b "16,200 sq. leagues." 117,090 Eng. sq. miles. (Morse.)

STATISTICAL TABLES

OF ITALY.

LOMBARDO-VENETIAN KINGDOM, divided into two governments and seventeen delegations, including forty-one Towns, a hundred and seventy-six Burghs, and five thousand four hundred and eighty-one Villages and Hamlets.*

^d Founded in 1765.

^e The Sardinian debt amounted in 1816 to £3,600,000 (86,400,000 francs.) M. Adrian Balbi (*Balance politique du Globe*) makes it equal in 1826, to £4,200,000 (100,000,000 francs.); he admits that his calculation may be inaccurate, but it is certain that the public debt in 1826, was considerably greater than in 1816.

^f M. Ad. Balbi—(considered doubtful.)

^g Twenty geographical leagues are equal to a degree, consequently a geographical square league is equal to nine geographical square miles. Tr. [This is a mistake on the part of the translator. Twenty five geographi-

BOOK CXXXVII.

EUROPE.

Europe continued—Physical Geography of the Spanish Peninsula—History of the ancient People that inhabited Spain and Portugal—Mussulman Conquest.

No part of Europe is more favoured by nature than the Spanish Peninsula; its mountains, by the facilities they afford to partisan warfare, contribute to defend it against hostile invasions, and so great is the variety of its climate, that the productions of the tropics are blended with those of the temperate zone. Lofty plains, fruitful in useful plants, hills covered with vineyards, rich vallies, watered by fertilizing streams, and rivers so situated as to afford easy communications by means of canals, are the elements of an agricultural wealth, which might be rendered, by industry, more valuable than the possession of the largest colonies. A vast extent of coast, furnished with spacious and safe harbours, open to the navigation of two seas, is not less favourable to commerce. By what causes have the sources of so great prosperity been rendered unavailing? The population of France exceeds that of Spain by more than fourteen millions, but the superficial extent of Spain is greater than that of France by two thousand and sixty-five square leagues.

This extensive region has been called a peninsula, perhaps incorrectly; for the space included between the gulfs of Lyons and Gascony can hardly be considered an isthmus, since it is not less than ninety leagues in breadth, while the Peninsula itself is hardly three times as broad. The Pyrenees separate it from France. One half of the country is watered by the ocean, and the other by the Mediterranean. The greatest length from east to west is equal to 220 leagues, and the greatest breadth from north to south, to 190. The surface of the Peninsula is equal to 28,804 square leagues: of these, 4,922 belong to Portugal, 23,867 to Spain, and 15 to the republic of Andorra.^a

It is only of late years that the physical geography of the country has been accurately described. The mountains by which it is divided, it was formerly supposed, extended from a common centre, and their ramifications were compared to the veins of a vine leaf. A writer of very varied acquirements has detected the errors of former geographers. If the Spaniards are now less ignorant of the mountains, rivers and basins in their peninsula, they are indebted to the labours of a foreigner.^b

^a These leagues are each equal to two English miles and a half; if then they be multiplied by 6 $\frac{1}{4}$, the result will be equal to the superficial extent of the Peninsula in English square miles.—Tr. [The French geographical league, or 25 to a degree, is equal to 2.77 Eng. miles; the French post league, to 2.42 Eng. miles.—P.]

^{*} The writer of the note should have said, these sq. leagues are equal to 6 $\frac{1}{4}$ Eng. sq. miles, (the linear leagues being equal to 2 $\frac{1}{2}$ Eng. miles.) But the French leagues here employed are undoubtedly the geographical of 2.77 Eng. miles (linear meas.) as will appear by comparison with the extent of the Peninsula in Eng. sq. miles, (217,502 Eng. sq. miles, Morse;) consequently the leagues in the text should be multiplied by 7.67, to give the Eng. sq. miles.—P.

The mountains in the Peninsula, according to M. Bory de St. Vincent, form seven different divisions.

The Pyrenæan range, which comprehends the whole chain of the Pyrenees, may be divided into five principal masses. First, the *Mediterranean* or eastern, in which the highest summit is the peak of Canigou, and from the declivities of which rise the Segre, a feeder of the Ebro, and the Ter and the Llobrega, that throw themselves into the Mediterranean; secondly, the *Aquitanian*, the glaciers of which are the sources of the Garonne and the Adour, but from which no large river flows into Spain; thirdly, the *Cantabrian* or central, separated from the Asturian by the sources of the Ebro; fourthly, the *Asturian*, almost as high as the Aquitanian, and rising abruptly on the south; fifthly, the *Portuguese* or western, of which the ramifications extend to the mouth of the Duero.

A geologist has observed that, although the Pyrenæan chain belongs to the granite formation, the same substance is not so ancient as in several other parts of Europe.^c Granite rocks are seen throughout the whole range, and they still bear the marks of a former revolution.^d Micaceous schistus rests on the sides of the granite mountains, and supports, in its turn, rocks containing organic remains of the most ancient date; the latter are overlaid with red sandstone; and lastly, calcareous rocks, similar to those on the Alps and Jura, extend to the lowest declivities. White marble or primitive limestone appears in different directions above the granite, and the Alpine limestone is, in many places, covered with rocks containing amphibole.^e

The Iberian range consists of different chains, which unite on the north-west with the Pyrenees, and terminate on the south-east, near the banks of the Guadalaviar. These different chains, united to each other, are called the *Sierra de Oca*, the *Sierra de Moncayo*, the *Sierra de Gudar*, and the *Sierra de Espadan*. The *Sierra de Molina*, which joins the *Sierra de Albaracin* and the mountains of Cuenca, belongs to the same range.

The chain, consisting of the latter mountains, forms a subdivision that has been called the Hesperian range. Calcareous rocks^f abound, and the low plains are covered with alluvial deposits, mixed with so many fossil bones, that the localities where they are found are known to the inhabitants

^b M. Bory de St. Vincent, *Guide du Voyageur en Espagne*, 1 vol. 8vo. 1823. *Diccionario de España y Portugal*, por el Doctor Sebastian de Miñano, 10 vol. 4to. 1826. The arrangement of the mountains, in the article Spain, in the Dictionary, is almost literally a translation from M. Bory de St. Vincent's work.

^d "Soulèvement"—elevation from beneath.

^e Trap rocks

^f Sp. *Sierra*, Port *Serra*, a chain of mountains.—P.

^g "Calcaire ancien."

ny the name of Las Calaveras.^a Many of the remains belong to animals now extinct. The vallies from the sources of the Guadalaviar to its mouth, are watered by rapid streams, and surrounded by steep heights. The Sierra de Espadan has been compared to a long wall; lofty peaks are seen from sombre vallies, and tortuous ravines, intersected by many rivulets, form an inextricable and gigantic labyrinth. Calcareous rocks,^b abounding in different metals, rise towards the east, but on the west, the country assumes a different aspect; the mountains are less precipitous, and their black and porous rocks indicate a volcanic origin.

The Carpetano-Vettonic range, so called, because, in ancient times, its sides were inhabited by the *Carpetani* and the *Vettones*, joins the Iberian mountains on the east, and terminates on the west at Mount Junto, which commands the Tagus at no great distance from its mouth. The principal chain is steep and narrow; it forms the boundary between Old and New Castile, and separates the province of Salamanca from Estremadura. From the same chain, during the winter season, proceed the storms and tempests that are not uncommon at Madrid, and in summer, it increases the heat of the atmosphere, by reflecting the burning winds, which blow from Africa, and traverse the arid plains of La Mancha. Some summits are so lofty, that the snow has been known to remain on them throughout the year. The range may be divided into three groups; the eastern, formed by the *Somo-Sierra* and the *Guadarrama*; the central, or the *Sierra de Gredos*, the most elevated of them all, in which there is a *sua!* *g. acie!*, near the place called *Palacio del Moro Almanzor*, and several lakes, the outlets of which unite with the Tormes, a feeder of the Duero; lastly, the western, which comprehends the *Peña de Francia*, the *Sierra de Gata*, the *Sierra de Estrella*, and the heights that reach to the neighbourhood of Lisbon. In no part of the Peninsula are the woods and forests so extensive as in the last group. Granite appears to be the most common rock; it is of a coarse texture and a grayish colour, and it may be concluded to be of a comparatively recent formation, both from its liability to decomposition, and from the masses of a harder granite contained in it. Calcareous rocks abound in the neighbourhood of Madrid, where chalk, containing dark-coloured flints, serves as a support for recent deposits.^d

The Lusitanian range is lower than any that have been already mentioned, and the snow never remains on any part of it during the summer. It occupies the country between the Tagus and Guadiana, and is formed by the mountains of Toledo on the east, the *Sierra de Guadalupe* in the centre, and the *Sierra de San Mames* on the west; from the latter the *Sierra de Estremos* projects to the south.

The Marianic range, or the chain formed by the ancient *Marianus*, is higher than the last; the greatest elevation may be about 4600 feet,^e and the snow remains in some places during nine months in the year. The greatest part of the chain separates the course of the Guadiana from that of the Guadalquivir. The eastern extremity consists of two branches, the *Sierra Alcaraz* and the *Sierra de Segura*; the centre has been called the *Sierra Morena*, which signifies the black mountains, and recalls the ancient name of

Mons Marianus; the *Sierra Albaleya*, which terminates near the Guadiana, forms the western extremity. The heights that surround Alcaraz are composed of argillaceous sandstone; and a chain consisting of volcanoes, now extinguished, but still easily discernible, stretches along the base of the summits situated near the sources of the river.^f

The Cuneic range consists of the small chain which the ancients called *Mons Cuneus*. It extends from the mouth of the Guadiana to Cape St. Vincent, and separates the kingdom of Algarva from the province of Alentejo, which forms the southern part of Portugal. It consists of two chains, the eastern or the *Sierra Calderona*, and the western or the *Sierra de Monchique*. The heights are not lofty, and the range differs from the others in its constituent parts: sandstone is very common, but lava and other substances of the same kind appear in the eastern part; the name of *Sierra Calderona*, or the *Caldron Mountains*, is not inapplicable to that part of the range, since it consists of a series of volcanic cones, the craters of which still retain their forms and the characters that mark their origin.

The Bætic range, of which the northern sides formed the Roman province of *Bætica*, extends from the Rio Almanzor to the heights that terminate near the mouth of the Guadalquivir. The central part is made up of the *Sierra Nevada* and the *Sierra de Loja*. Although not the largest, it is certainly the loftiest range in the Peninsula. Many summits, higher than the Pyrenees, are covered with eternal snow. The steep sides of the mountains of Ubrique, Algodonales and Gator, are commanded by the peak of San Cristoval. The snow always appears on the top of the *Serrania de Ronda*, where a small hermitage has been erected, and dedicated to *Nuestra Señora de las Nieves*.^h In the eastern part of the same range are different groups, that rival each other in height; the most remarkable are the *Sierra Prieta*, the *Sierra de Alhama* and the *Sierra Tejada*, but in point of picturesque scenery, they cannot be compared with the *Sierra de Torqual*, in which rocks of various forms and dimensions are so singularly arranged, that they might be compared to the ruins of a town built by the Titans. But these mountains are neither so imposing nor so lofty as the summits of the Sierra Nevada, which, commanding the horizon on every side, bear the marks of perpetual winter. The snow line commences at the height of about 9500 feetⁱ above the level of the Mediterranean, which bathes the southern base. From these summits, says M. Bory de St. Vincent, may be seen at the same time the Sierra Morena, more than thirty leagues distant towards the north, and the coasts of Africa, which are at least forty-five leagues distant to the south. The Mulahacen is the most elevated point in that range of snow-covered peaks; it reaches nearly to the same height as the famous peak of Teneriffe, or, in other words, to more than 12,700 feet.^k The vallies in the Bætic range are deep, and cross each other in every direction; most of them are watered and rendered fruitful by limpid streams.

The whole chain is of primitive formation. The Sierra Nevada is schistous; primitive limestone and marble of different colours^l rest upon the gneiss, together with calcareous breccias, which are employed as ornaments in building.

^l "Veined marble."

The fine kind of onyx, called *nicolo* by the lapidaries, is not uncommon in the neighbourhood of Cape Gata. The rock of Gibraltar, at the other extremity of the chain, rises to the height of 1470 feet^a above the Mediterranean. It has excited for a long time the attention of geologists. It consists of gray limestone, divided by perpendicular fissures, and these are filled with calcareous concretions, containing an immense quantity of bones and shells; many of the former belong to different sorts of deer, none of which are at present found in Europe.^b Such phenomena may be considered the proofs of a partial cataclysm, fatal to the animals which formerly inhabited our continent.^c

As connected with the heights in the Peninsula, it may be worth while to mention the *Parameras*, or interior table-lands, all of which are very lofty, and many of a great size. They either extend between different parts of the ranges that have been already mentioned, or are situated near their summits, so that they appear less elevated than they really are. The most remarkable of these bare and solitary table-lands are situated in the provinces of Avila and Soria. In the Pyrenees, in the mountains of Molina, Albaracin and Cuenca, and also in those of Toledo and Gredos, may be seen other *parameras*, which, independently of their extent, might be compared with the arid summits in Tartary.

Considered physically, the Peninsula may be divided into five large basins, and into as many others of a smaller size. To the first class belong the basins of the Ebro, the Duero, the Tagus, the Guadiana, and the Guadalquivir; to the second, the basins of the Guadalaviar, the Jucar,^d the Segura, the Mondego, and the Minho. The basin of the Ebro, although the smallest in the first class, is larger than any other that communicates with the Mediterranean. Three of the second class are also inclined in the same direction; while, from four large basins and two of a smaller size, the waters of the Peninsula are borne to the ocean. Thus, before the straits of Gibraltar were formed, all the eastern and southern declivities in the country must have been submerged, while the others, on the side of the ocean, were no longer inundated.

The Tagus flows through the longest basin in the Peninsula; it was famed in ancient times; its name has not been changed.^e Poets have celebrated the happy banks and flowery meads of the Tagus; but whoever surveys its numerous windings, discovers little that can justify the praises of Silius Italicus and other ancient writers. The arid banks are, in most places, very steep; for more than three fourths of its course, it flows with the rapidity of a torrent. The ancients styled it *Auratus*, but no particles of gold are now found in the red ooze carried down by the waters. The river has its source in the Albaracin mountains, and the length of its course is not less than a hundred and seventy leagues. The principal feeders on the right bank are the *Jarama*,^f which is enlarged by the *Tajuna*, the *Guadarrama*, that descends from the mountains of the same name, the *Alberche*, that rises between the mountains of Gredos and Avila, the *Tietar*, that has its source in one of the branches of the Sierra de Gredos, and lastly, the *Alagon* and the *Zezeze*, the former rising from the Sierra de Francia, and

the latter at the base of the Sierra de Estrella. The largest streams that enter the Tagus on the left bank, are the *Rio del Monte* and the *Salor*, of which the one descends from the Sierra de Guadalupe, and the other from the Sierra de Montanches.

The ancient name of the Anas is still retained in the Guadiana, an Arabic periphrase which signifies the water of the Ana. The length of the river is about 150 leagues; it descends from the mountains of Cuenca, where it is called the Rio Gijuela; but as it is formed by several streams that unite with each other, its real source has not yet been determined. It is supposed that it issues from the marshes of Riduera, whence indeed a rivulet escapes and disappears after a course of twenty-five miles,^g but it is seen anew near a place called the *Ojos de Guadiana*.^h The *Ojos* or Eyes are several large fountains which issue from the earth, and form by their junction a stream that the inhabitants of the country call the Guadiana. Several rivers are known which appear and disappear, but if the marshes of Riduera be really the sources of the Guadiana, it disappears twice before it has traversed its extensive basin. The size of the river, still insignificant below the Gijuela, is not much increased until it receives the *Jabalón* on the left bank, and the *Bullague* on the right, the latter of which descends from the mountains of Toledo. It receives, at a greater distance from its source, the *Guadalema* and the *Zaya*, which rise in the mountains connected with the Sierra Morena; the other feeders are the *Matachel*, which issues from the Sierra Constantina, and the *Ardila* and the *Chanza*, that descend from the Sierra de Aracena. All these enlarge the Guadiana, and give it such a degree of velocity below Martola, as to form a cataract, called the Wolf's Leap, or *Salto del Lobo*.

The Duero, or the Douro,ⁱ the ancient *Durius*, flows through a broader basin than the Tagus or the Guadiana; it has its source in the peak of Urbion, and separates it from the Sierra de Oca. The length of its course is about a hundred and forty leagues, and, as its basin is very broad, most of its feeders are important. The *Pisuerga*, one of the largest on the right bank, is formed by the junction of several rivers that rise in the Pyrenees^k and the Sierra de Oca; the *Esla*, which descends from the Pyrenees,^l and receives itself several large feeders, falls into the Duero, below its junction with the *Pisuerga*; the *Tanega* enters the same river at the distance of fifteen leagues from the ocean. The feeders on the left bank are the *Eresma*, from the *parameras* of Avila, the *Tornes*, from the lofty summits of Gredos, and the *Rio Coa*, from the Sierra de Gata. The soil in different parts of the basin is not unfruitful, but, in some places, the land is so heavy, that the rain changes it into a thick and tenacious clay, while, in others, it consists of moving sand, on which the only plants are resinous trees. The river, after it leaves the mountains, waters dismal and extensive *parameras*, of which the elevation above the sea is not less than 2400 feet.^m A wretched vegetation heightens the monotonous appearance of these immense plains.

When the Arabs made themselves masters of the Peninsula, they were struck with the great size of the Bætis, and

gave it the name of *Guad-al-Keber*,^a or great river, which has been changed by the Spaniards into *Guadalquivir*. According to the common opinion, it rises on the western declivity of the Sierra Sagra; but since, according to the rule generally adopted by geographers, the source of a river must be sought in the stream most distant from its mouth, the Guadermena, which descends from the Sierra Alcaraz, has been incorrectly denominated, and should have been called the Guadalquivir; thus the river rises in the basin of the Guadiana, and traverses the Bætie range. Two other large rivers, issuing from the same basin, enter the Guadalquivir on the right side, one of which, or the Ajandula, flows across the Sierra Morena, and the other, or the Biar, opens a passage for itself in the middle of the Sierra Constantina. The Genil,^b or the ancient *Singilis*, the largest feeder that flows from the Sierra Nevada, enters the same river on the left bank. The lands near the Genil are in many places deeply impregnated with salt; efflorescences hurtful to vegetation are formed in the summer season. The Guadalquivir, after its junction with the Genil, waters a low and fruitful country, but beyond the neighbourhood of Seville, a belt of land, about two leagues in breadth, which the inhabitants call the *Marisma*, as insalubrious as the Italian Maremmas, extends from the Tablado to the salt marshes of San Lúcar. That small uninhabited region is intersected by several brackish streams, which, descending from the declivities of Moron and Montelliano, change the country into a sort of marsh; a few slender plants, useful only in furnishing soda, are all the vegetation on the light ooze thus formed. But the river, divided into several branches, encloses different islands, such as the *Menor* and the *Major*,^c as well as others of great fertility, and numerous herds of cattle are reared on their rich meadows. The same river is not navigable above Cordova.

It is at Font-Ibre, (Lat. *Fons Ibera*^d) in the valley of Reynosa, that the Ebro takes its source. It was called the *Iberus* by the Romans. During the greater part of its course, it is confined by mountains, and the vallies they enclose afford passages to its numerous feeders. On the left side, the *Agra*^e and the *Arragon* unite, and, at no great distance beyond their junction, enter the river; farther down, it receives the *Gallego*, near Saragossa, and the *Cinca* and the *Segre*,^f below Mequinenza; all of these rivers flow from the Pyrenees. Other feeders descend from the Sierra de Oca, the Sierra de Moncayo, and the Peña de Goloca. The principal are the Xalon, which has been compared to the Marne, and the Guadalupe, which the Arabs rendered useful by their canals in the basin of the Ebro. The length of the Ebro, including its windings, amounts to about 120 leagues; although less sinuous and more rapid than the Seine, it may be compared to it from the extent of its course and the body of its water. Its navigation is often impeded by rocks that have fallen from the mountains; consequently the Spanish government has been at considerable expense in constructing a canal parallel to the river, from Tudela to Sastaga. It might be equally useful to complete a canal, which was begun many years ago, between the Ebro and the Duero. The country between the two rivers is not of such a nature as to oppose any great obstacles, but the funds are wanting for the completion of such a work. A canal stretches along the Segre, between Mequinenza and Lerida. These canals

in the basin of the Ebro have diffused abundance in that part of Spain; still their number is not sufficient. The deposits which the river carries to the Mediterranean have formed a considerable delta at its mouth, and it has been necessary to cut a canal, in order that vessels may ascend to the small town of Amposta below Tortosa.

The other basins in the Peninsula, although of less consequence, may be briefly mentioned. On the south of the Ebro extends the basin of the Guadalaviar, a small river rising between the Sierra Molina and the Sierra de Albaracin, and fed by several streams, of which the Alhambra is the most considerable. The length of its course is more than fifty leagues: the basin which it waters is bounded on the north by the Peña Goloca, and other heights that extend towards the Ebro, and on the west by the chain that stretches to the Sierra de Albaracin. On the south of the last is situated the basin of the Júcar, another small river, fed by the Gabriel and the Lambay, and forming many windings between mountains and hills. The Júcar rises on the western declivities of the Sierra de Albaracin, and runs to the distance of more than eighty leagues. The basin of the Segura is broader than the two last; on the north and on the east it is bounded by hills, and a group of mountains, called the Peñas de San Pedro, extends on the north-west; on the west are situated the Sierra Alcaraz and the Sierra Sagra. The Segura, including its windings, is equal in length to fifty-five leagues; it receives the waters of the Río Mundo, the Quipar and the Sangonera. In the first part of its course, the country which it waters is wild and desert, but from the valley of Ricote to the Mediterranean, the soil is covered with the richest vegetation.

Two small rivers discharge their waters into the ocean; the largest of these, or the Minho,^g descends from the Sierra de Mondonedo: although of considerable breadth, the length of its course does not exceed sixty leagues. It flows southwards until it joins the Sil, then turns to the west, where it is bounded on one side by the Sierra de Penagache and the Sierra de Estrica, and on the other by the Sierra de Barcia. The mountains adjoining the same basin, exclusively of those connected with the Pyrenees, belong to the Sierra de Segondina, from which the Bibey, a feeder of the Sil, takes its course. The Mondego, a river to the south of the Duero, flows in the direction of east to west; the basin through which it passes is enclosed by the Sierra de Aleoba and the Sierra de Estrella; the distance from its source to its mouth is not less than fifty leagues; it is fed by the Alva, the Seire and the Soire.

The division of any country according to the basins that may be contained in it, cannot satisfy the geographer, who seeks other limits than those which are obvious to the eye, other boundaries than the courses of rivers. A writer,^h who has thrown additional light on many subjects, has divided the Peninsula into four parts, according to the inclination of the surface. The first or the Cantabrian division is formed by the northern declivities of the Pyrenees, from the sources of the Adour to Cape Ortegá. The second or the Lusitanian division consists of the southern declivities of the Pyrenees and of those which are watered by the Duero, the Tagus and the Guadiana; it forms a vast semicircle, of which the two extremities are Cape Ortegá and the mouths of the last mentioned river. The southern declivities of the Sierra

Morena, and all the mountains connected with the same chain, that terminate at Cape Gata, including the Sierra Nevada, make up the third or Bætic division, which embraces within its circuit the Guadalquivir and its branches. The last or the Iberian division comprehends the eastern declivities of all the mountains, which, extending from Cape Gata to the Pyrenees, form the Sierra de Algamilla, the Sierra de Segura, the Sierra de Albaracin, the Sierra de Molina, the Sierra de Moncayo, and the Sierra de Oca. The southern declivities of the Pyrenees, from their connexion with these Sierras, form part of the same division. This arrangement, intended to explain the passage taken by the sea, when it left the Peninsula, does not appear to correspond strictly with the phenomena which the vegetation of the country presents. To elucidate that subject, another plan must be adopted; this fair portion of Europe may therefore be divided into six regions, by which it will not be difficult to classify the principal facts relative to the temperature.

The central or Celtiberian region comprehends the two great table-lands of Old and New Castile, or, in other words, the Sierra de Gata, the Sierra de Gredos, the Sierra de Avila, and the mountains of *Somo-Sierra*, on the north of the Tagus, and on the south of the same river, the Sierra de Manes and the mountains of Toledo to the defiles of the Sierra de Molina, and also all the western declivities of the Sierra Morena and the Sierra de Albaracin, as far as the Sierra Martes. Although forests and isolated summits occasionally appear in this part of the Peninsula, it consists chiefly of sterile and immense plains; it is formed by an assemblage of table-lands, not unlike the central one in Asia Minor. The apple-tree is nowhere seen; the olive begins to show itself in the south, and the vine succeeds almost throughout the whole extent. The oak that yields the sweet acorn flourishes in the same part of the country; its fruit,^a in taste not unlike the almond, may be conceived to have been food for the earliest inhabitants of Spain.

The southern or Bætic region extends from east to west, from Cape Palos to Cape St. Vincent, and from north to south, from the southern declivities of the Sierra Morena, including the mountains of Algarva, to the Mediterranean and the ocean. The climate is hotter than in Sicily. The country in the neighbourhood of the sea might almost be considered an African zone; it is marked by the presence of the banana, the dwarf-palm and the cactus.^b The stony places are covered with the caper-bush; its numerous and long stems, and its large flowers with purple stamens, adorn with their elegant tufts the rocks and uncultivated lands. A second zone, always verdant, and covered with the plants of Sicily and Italy, rises above the last. The myrtle, the orange and lemon tree, the rose laurel, the agnus castus, the tamarisk and the oleander are most common in this part of the Peninsula. Another and a higher zone is adapted for the vine and different kinds of grain: forests of pine extend above it, and to these succeed Alpine plants and heights covered with eternal snow.

The eastern or Iberian region comprehends, from north to south, all the space between Cape Palos and Cape Creux, and from east to west the basin of the Ebro, and the lands situated between the Sierra de Molina, the Sierra de Albaracin, the Sierra Martes, the mountains of Palomera and Orihuela, and the Mediterranean. This magnificent portion of the Peninsula, which may be compared to the shores of Ionia and

Doris, possesses all the plants of Sicily, the Archipelago and the Levant. The olive flourishes every where, the carob tree grows near the lentisk, while the myrtle, the laurel, the fig and the mulberry display their varied foliage; the grape yields a strong wine, but within the same division, as in the last, are situated several zones, which exhibit different kinds of vegetation, from the low vallies to the summits of the Pyrenees.

The Lusitanian region, or that of the lower Tagus, extends from south to north, from Cape St. Vincent to Cape Roca; its breadth is determined by the southern branch of the Sierra de Estremos, and farther north by the Sierra de Manes. It is sheltered against cold winds by the mountains on the north of the Tagus. The lower parts are covered with sandy heaths, but one zone may be distinguished by its groves of orange and olive trees. M. Bory de St. Vincent observed on the coasts, particularly to the south, a vegetation similar in some respects to that of the Atlantic islands. "From the mountains of Cintra and the Semas de Ourem to Cape St. Vincent," says the same writer, "botanists may discover a great many plants, which, it was supposed, were confined to the Azores, Madeira and the Canaries. American plants thrive and multiply easily; some of them might even be considered indigenous; at all events, they have banished such as are so in many large districts, where they flourish as well as in their native land."

The Galician region, or that of the Duero, which occupies, from north to south, the space between Cape Roca and Cape Finisterre, is different from the preceding; the oak and the chestnut abound, and the vine prospers, but the olive and the orange appear only in the low vallies to the south of the Duero.

The northern or Cantabrian region comprehends all the country from the sources of the Adour to Cape Finisterre; it is intersected by vallies, which incline either from east to west, or from south to north. The plains are not extensive, and all of them are situated near the coasts. The constant and uniform character of the region consists in the absence of the cistus and rose laurel. The orange and the olive are reared with difficulty, and the same remark is applicable to the vine; but the hills and vallies in this fruitful region are covered with lofty forests, rich crops and verdant meadows. The constant verdure may be attributed to a fertile soil and a humid atmosphere. The apple flourishes in every district; cider is substituted for light wine, so that the country may be considered the Normandy of the Peninsula.

If, as every appearance leads us to believe, Africa and Spain were once united, the Balearic islands must have been part of the Peninsula. They seem to be a continuation of the chain which terminates at Cape St. Martin; their general direction is from south-west to north-east; they consist of four principal islands, Ivica and Fromentera, Majorca and Minorca, but several others of a smaller size are situated near their coasts. Thus, around Ivica, may be seen *Conejera Grande* or Great Rabbits' island, as well as Esparto, Bebra, Espalmador,^c Espardella^d and Tagam. Near the coasts of Majorca, are situated *Dragonera* or Dragons' island, *Conejera* or Rabbits' island, and *Cabrera* or Goats' island. The island of Ayre lies near the southern shores of Minorca: the others may be passed over in silence; they are of little or no importance.

The island of Fromentera^e is equal to four leagues at its

^a Span. *Bellota*.

^b Schow's Botanical Geography. Copenhagen, 1822.

^c Espalmadora.

^e Formentera.

^d "Espardell"—Espartil?

greatest breadth, while its utmost length does not exceed five. It is believed that it has been so called in modern times, from the great quantity of grain which it produces in proportion to its surface. It was the lesser Pityusa or *Pityusa Minor* of the ancients.^a Ivica or Iviza,^b to the north of the last, is about twenty-two leagues in circumference; the Romans called it *Ebusus*. It might be inferred from their ancient names,^c that these islands were once covered with forests.

Majorca or Mallorca^d is the *Balearis Major* of the ancients: it is about fifty leagues in circumference. Strabo informs us that the rabbits, which the early inhabitants brought to it, multiplied so rapidly, that the people were at last obliged to implore the assistance of the Romans to destroy these animals.^e

Minorca or Menorca,^f the ancient *Balearis Minor*, is not less than thirty-eight leagues in circumference; it lies to the east of the last.

The land in these islands is mountainous; their geological formation is everywhere the same. Calcareous rocks are the most common, a fact that may serve to corroborate the opinion concerning their submarine junction with Cape St. Martin. The heights of the mountains, the rocks and the vegetables of the Baleares, have been accurately known since 1825, the year that a French naturalist^g visited these islands. The island of Majorca is, in these respects, the most interesting; its two principal mountains are the *Puig de Torcella* and the *Puig Major*.^h The two groups of mountains, which divide the island, are formed by calcareous rocks, belonging to the rock called *lias* by the English, and to the oolitic limestones.ⁱ Dolomite, porphyry, and other rocks, which appear to be of igneous origin, are also to be met with. Medicinal springs and different specimens of copper ore indicate the mineral wealth of the island, from which the inhabitants have hitherto derived no advantage. Majorca, like the other Baleares, may be distinguished by its arid summits and verdant vallies. The carob and the olive tree appear in all their vigour. The first occupies the lowest level, and ascends to the height of 1500 feet.^k The second thrives on the mountains; it unites with the box and the Aleppo pine, in covering the declivities, but the last, extending to the height of six hundred feet^l above the olive, mingles with the evergreen oak, which reaches 300 feet^m above it. The highest summits are covered with the *Sesleria cœrulea*.ⁿ The dwarf palms, on the stony heights near the coast, protect with their broad foliage different species of *Cyclamen*, *Ononis* and *Anthyllis*. The peasants often set fire to the forests of oaks and pines on the mountains, in order to promote the vegetation of a plant which they call *carregt* (*Donax tenax*.) It diffuses itself over all the vacant space thus produced, and affords, in the following year, an abundant nourishment for mules and cattle. In vain do the

pinces and oaks push forth their shoots; the carregts keep their ground, and it is not until after many years that they yield to the efforts of their gigantic neighbours. The myrtle, the pistachio,^o the thorny caper bush, the cistus, and the rosemary, on the stony heights near the mountains of Majorca, indicate the Mediterranean region. The ligneous *sali cornia* and the tamarisk grow in the salt marshes near the shore, the vine flourishes on the hills, and the cotton plant is cultivated in low and humid places.^p It is unnecessary to give an account of the vegetable productions in the neighbouring islands, as they differ but little from those that are found in Majorca.

The *Baleares*, or *Balearides*, were so called by the Greeks, from the great skill with which the inhabitants used the sling.^q According to Pliny, these islands were also called *Gymnasie*,^r because the inhabitants went naked to battle.^s Their arms were a small buckler, a javelin, and three slings of different sizes, one or other of which was used according to the distance of the enemy. Their children were early accustomed to handle the same instrument; it is said that their parents refused to give them food, until they hit a mark at a certain distance. It has been inferred from the surname of *Gymnasii*, or *naked*, that the Greeks and Romans had not often friendly intercourse with these islanders, for it is certain that in private life, they wore dresses long before the inhabitants of Italy. The Romans conquered the Baleares, not so much to put a stop to the piracies of the islanders, as to deprive the Carthaginians of important stations for the commerce of the Mediterranean. The same people founded *Palma* and *Pollentia* in Majorca, two places which shall be afterwards mentioned; these islands formed part of the Tarragonian province (*Provincia Tarraconensis*.)

Many conjectures have been formed concerning the origin of the words *Hispania* and *Hesperia*, the ancient names of the Peninsula. It is probable that *Hispania* comes from the Phœnician word *span*, which signifies *concealed*—not an inapplicable name, for at an early period, the country was little known to the Phœnicians. It has been also said that they called it *Spania*, from the number of rabbits they observed in it.^t The Greeks called it *Hesperia*, from its western situation, relatively to their own country.^u The name of *Iberia*, which it also bore, seems to have been derived from the name of its early inhabitants. M. Bory de St. Vincent supposes them a colony from the island or continent of Atlantis. Such an assumption, however, is liable to many objections, but it appears to be as probable as the opinion supported by several Spanish authors, who affirm that the first inhabitants of their country were descended from Tubal, a son of Noah,^x who landed in Spain twenty-two centuries before the Christian era.

The Iberians, according to Herodotus, were divided into

six tribes; the *Cyneta*, *Gletæ*, *Tartesi* or *Turdetani*, *Eleusini*, *Martini*, and *Celeiani*. Strabo informs us that the Turdetani had made great advances in civilization, that they applied themselves to literature, and that they possessed books of poetry and history of a very ancient date, and laws which, they affirmed, were written six thousand years before his time.^a

Diodorus Siculus mentions the passage of the Celts into Spain. The Iberi made war against them for a long time, but, after an obstinate resistance on the part of the natives, the two people entered into an agreement, according to which, they were to possess the country in common, bear the same name, and remain for ever united; such, says the same historian, was the origin of the Celtiberi in Spain. These warlike people, continues Diodorus, were equally formidable as cavalry and infantry, for when the horse had broken the enemy's ranks, the men dismounted and fought on foot. Their dress consisted of a *sagum* or coarse woollen mantle; they wore greaves made of hair, an iron helmet adorned with a red plume, a round buckler and a broad two-edged sword of so fine a temper as to pierce through the enemy's armour. Although they boasted of cleanliness both in their food and in their dress, it was not unusual for them to wash their teeth and bodies with urine, a custom which they considered favourable to health. Their habitual drink was a sort of hydromel; wine was brought into the country by foreign merchants. The land was equally distributed, and the harvests were divided among all the citizens; the law punished with death the person who appropriated more than his just share. They carried so far the duty of hospitality, that they considered it a special favour to entertain a stranger, being convinced that the presence of a foreigner called down the protection of the gods on the family that received him. They sacrificed human victims to their divinities, and the priests pretended to read future events in the palpitating entrails.^b At every full moon, says Strabo, they celebrated the festival of a god without a name; from this circumstance, their religion has been considered a corrupt deism.

The Phœnicians were the first people who established colonies on the coasts of Spain; *Tartessus* was one of the most ancient; at a later period, they founded *Gades*, now Cadiz, on an island of the same name. They carried on there a very lucrative trade, inasmuch as it was unknown to other nations; but in time, the Rhodians, the Samians, the Phocæans and other Greeks established factories on different parts of the coast.

Carthage had been founded by the Phœnicians; but the inhabitants, regardless of their connexion with that people, took possession of the Phœnician stations, and conquered the whole of maritime Spain. The government of these republicans was less supportable than that of their predecessors; the Carthaginians were unable to form any friendly intercourse with the Spaniards^c in the interior; their rapine and cruelty excited the indignation of the natives.

The ruin of Carthage paved the way to new invaders, and Spain was considered a Roman province two centuries before the Christian era. Those who had been the allies, became the masters of the Spaniards, and the manners, customs and even language of the conquerors were introduced

into the Peninsula. But Rome paid dear for her conquest; the north, or the present Old Castile, Arragon and Catalonia, was constantly in a state of revolt; the mountaineers shook off the yoke, and it was not before the reign of Augustus that the country was wholly subdued. The Peninsula was then divided into three provinces, *Lusitania*, *Bætica* and *Tarraconensis*.

The Lusitanian province or the western region was separated on the north from *Tarraconensis* by the Duero, as far as its confluence with the Tormes; the two most eastern points within its limits were *Libora* on the Tagus,^d and *Augustobriga*. The course of the Guadiana served as a boundary from the mountains of Toledo to the Atlantic. Thus, it comprehended the greater part of Portugal, and all Estremadura. *Emerita Augusta*, the present Merida, was the capital of the province.

Bætica was separated from Lusitania by the Guadiana, and from *Tarraconensis* by a line extending from the neighbourhood of Ciudad-Real to the Rio-Almanzor; it formed the most southern portion of the Peninsula; *Corduba* was its capital.

All the rest of Spain was included in the province of *Tarraconensis*; *Gallacia*^e on the north-west, now Galicia, *Carthaginensis*, now the kingdom of Murcia, and the Balearic islands were contained in it.

The same province was also called *Hispania Citerior*, while the two others formed *Hispania Ulterior*.

The southern part of the province of Lusitania was peopled by the *Cyneta* or *Cynesii*, the earliest inhabitants of Algarva, and by the *Celtici* or *Celta-Gletæ* between the Guadiana and the Tagus. The country round the mountains of Gredos belonged to the *Vettones*, a people that passed alternately from a state of inactivity and repose to the vicissitudes and hardships of war. The *Lusitani*, a nation of freebooters, were settled in the middle of Estremadura; they were distinguished by their activity and patience of fatigue; their food was flour and sweet acorns;^f beer was their common beverage. They were swift in the race; they had a martial dance, which the men danced, while they advanced to battle.^g

The part of Bætica near the Mediterranean, was peopled by the *Bastuli* or, as they were also called, the *Pani*. The *Turduli* inhabited the shores of the ocean, near the mouth of the Bætis. The *Bæturi* dwelt on the Marianic mountains,^h and the *Turdetani* inhabited the southern declivities of the Sierra de Aracena. The last people, more enlightened than any other in Bætica, were skilled in different kinds of industry long before their neighbours. When the Phœnicians arrived on their coast, silver was so common amongst them, that their ordinary utensils were made of it. What was afterwards done by the Spaniards in America, was then done by the Phœnicians in Spain; they exchanged iron and other articles of little value for silver; nay, if ancient authors can be credited, they not only loaded their ships with the same metal, but if their anchors at any time gave way, others of silver were used in their place.

The people in *Gallacia*, a subdivision of *Tarraconensis*, were the *Artabri*, who derived their name from Cape *Artabrum*, now Cape Finisterre; the *Bracari*, whose chief town was *Bracara*, the present Braga; and lastly the *Lucenses*,

of which *Lucus Augusti*, now Lugo, was the capital. These tribes and some others formed the nation of the *Cal-aici* or *Gallaci*,^a who, according to the ancients, had no religious notions. The *Asturi*,^b now the Asturians, inhabited the banks of the *Asturis* or the country on the east of the Gallæcian mountains; *Asturica Augusta*^c was their capital. The *Vaccæi*, the least barbarous of the Celtiberians, possessed the country on the east of the *Asturi*. The fierce *Cantabri* occupied the coasts of Old Castile; it was customary for two to mount on the same horse, when they went to battle. The *Carites*^d or *Caristi* inhabited part of Biscay on the same declivities of the Pyrenees; on the southern side of those mountains, the *Turmodiges*^e and the *Murbogi*^f were settled in the province of Burgos. Their neighbours on the east, were the *Autrigones* in Alava, the *Berones* in Rioja, and the *Varduli* in Guipuscoa. The *Vascones* or the Navarrese, the ancestors of the present Gascons, were settled on the north of the Ebro. The *Jacetani* were scattered on the Pyrenæan declivities of Arragon. The brave *Ilergetes* resided in the country round Lerida, and the *Ves-citani*, between the *Vascones* and the *Ilergetes*. As to the country on the east of these tribes, the whole of Catalonia was peopled by the *Cerretani*, the *Indigetes*, the *Castellani*, the *Ausetani*, the *Saletani*^g and the *Cosetani*.^h As to the country on the south of the Ebro, the *Arevaci*, who were so called from the river *Areva*, were settled in the neighbourhood of Arevalo, and in the province of Segovia; the *Pelendones* possessed the high plains of Soria and Moneayo. The space comprehended between the mountains of Albaracin and the river, was peopled by the *Edetani*, one of the most powerful tribes in Spain. The *Ilercavones*,ⁱ who were not less formidable, inhabited an extensive district between the Upper Jucar and the Lower Ebro. The territory of the *Suesetani*, between the Ebro and the Guadalaviar, extended to the shores of the Mediterranean. The country of the *Carpetani*, including the space from the Guadiana to the Somo-Sierra, forms at present the archiepiscopal see of Toledo. The people on the south of the last, were the *Oretani*, between the Guadiana and the Marianic mountains, and the *Olcades*, a small tribe, near the confluence of the Gabriel and the Jucar. *Carthaginensis*, a subdivision of Tarracoenensis, was inhabited by two tribes;—the *Bastitani* in the centre of Murcia, who often made incursions into Bætica, and the *Contestani*, who possessed the two banks of the Segura, near the shores of the Mediterranean, from Cape Palos to the Jucar.

In time of peace, says Diodorus Siculus, the *Iberi* and *Lusitani* amused themselves with a lively and light dance, which requires much activity. That ancient writer alludes perhaps to the *fandango*, a dance of which the origin is unknown. An assembly, composed of old men, among the Celtiberians, was held every year; it was part of their duty to examine what the women had made with their own hands within the twelve-month, and to her, whose work the assembly thought the best, a reward was given. An ancient author,^k who mentions that singular custom, adds that copulency was considered a reproach by the same people; for in

order to preserve their bodies light and active, the men were measured every year by a girdle of a certain length, and some sort of punishment was inflicted on those who had become too large. The age of marriage was fixed by law; the girls chose their husbands among the young warriors, and the best means of obtaining the preference, was to present the fair one with the hand of an enemy slain in battle.

Strabo enters into some details concerning the dress of the ancient Spaniards. The Lusitani covered themselves with black mantles, because their sheep were mostly of that colour. The Celtiberian women wore iron collars with rods^l of the same metal rising behind, and bent in front; to these rods was attached the veil, their usual ornament. Others wore a sort of broad turban, and some twisted their hair round a small rod^m rising about a foot above the head, and from the rod was appended a black veil. Lastly, a shining forehead was considered a great beauty; on that account, they pulled out their hair, and rubbed their brows with oil.ⁿ

The different tribes were confounded while the Romans oppressed the country, but in the beginning of the fifth century, the Suevi, the Vandals and the Visigoths invaded the Peninsula, and mixing with the Celts and Iberians, produced the different races, which the physiologist still observes in Spain. The first people or the Suevi descended the Duero under the conduct of Ermeric, and chose Braga for the capital of their kingdom. Genseric led his Vandals to the centre of the Peninsula, and fixed his residence at Toledo; but fifteen years had not elapsed after the settlement of that barbarous horde, when Theodoric, conquered by Clovis, abandoned Toulouse, penetrated into Spain, and having taken Toledo, compelled the Vandals to fly into Africa. During the short period that the Vandals remained in the country, the ancient province of Bætica was called Vandalusia, and it bears the name of Andalusia to this day. But the Visigoths soon extended their conquests, and all the country from the Ebro to the Straits of Gibraltar, submitted to them. The ancient Celtiberians, who had so long resisted the Romans, made then no struggle for liberty or independence; they yielded without resistance to their new masters. Powers and privileges were the portion of the Gothic race, and the title of *hijo del Godo*, or the son of the Goth, which the Spaniards changed into *hidalgo*,^p became the distinctive appellation of a noble or a free and powerful man among a people of slaves. A number of petty and almost independent states were formed by the chiefs of the conquering tribes; but these barons or free men acknowledged a liege lord. Spain and Portugal were thus divided, and the feudal system was thus established. Among the Visigoths, however, the crown was not hereditary, or at least the law of regular succession was often set at defiance by usurpers. The sovereign authority was limited by the assemblies of the great vassals, some of whom were very powerful; indeed the Count Julian to avenge himself on King Roderic for an outrage committed on his daughter, delivered Spain to the Mahometan yoke.

After the country had submitted for three centuries to the

Visigoths, it was subdued by the Arabs in the year 712. A single battle, fought at Xeres on the left bank of the Guadalete, was sufficient to secure the conquest. The settlement of the Moors in the Peninsula may be considered one of the events which illustrate the superiority of a well informed and polished people over a nation divided by factions, and degraded by the feudal system. Cordova was chosen as the capital of their empire; rendered confident by success, they devoted themselves to the sciences, cultivated letters and the fine arts, embellished Cordova, Granada and other towns with their elegant mosques, governed the vanquished with mildness and justice, and nowhere violated the laws of a wise toleration. By such means, they thought to strengthen their empire, while a poor but intrepid people in the mountains of Asturia, were silently preparing a way for the independence of their country. Pelagius or *Pelayo*, a simple shepherd, whom some writers call a prince or a king, because he showed himself worthy of being one, founded the kingdom of Oviedo, which was extended by conquest to the Duero, and even to the chain of Guadarrama; the same kingdom was afterwards divided into two, those of Leon and the Asturias.^a The Christians were encouraged by his example; whilst they, to preserve themselves, concentrated their forces, the lieutenants of the caliphs were divided by ambition, and weakened by civil discord. They were styled kings of Cordova, Seville, Valencia and Granada, but they were not united, and separately they were unable to resist the torrent that threatened to destroy them. From the year 1085, the Moors began to lose their provinces in Spain, and on the second of January, 1492,^b Ferdinand of Arragon and Isabella of Castile made their triumphant entry into Granada, the last bulwark of the Mussulmans.

The kingdom of Granada lost with its ancient masters, its wealth and power. It was the finest conquest of the Spaniards, but fanaticism transformed it into a desolate and wretched province. The Mahometan population, the most enlightened, industrious and wealthy in the Peninsula, were reduced to slavery. It was forgotten that the Moors had

respected in the time of their prosperity, the laws and the religion of the vanquished. The fires of the Inquisition were kindled by the same men who preached union and brotherly love. According to the terms of the capitulation, concluded with the last king of Granada, no one was to be punished for his religious belief; but the violation of treaties made with infidels, was considered an act of piety by the Holy Office. The conquered, almost reduced to despair, were easily excited to revolt. Unable to resist, great numbers received baptism, and the wealthiest on paying a stipulated sum, obtained permission to pass into Africa. By this measure, considerable sums flowed into the royal treasury, but immense capitals were for ever taken away from Spain. Not satisfied with its triumph, the Inquisition pretended that the conversion of the Mussulmans was not real, and the latter could only escape from death by a new and successful revolt. Having fled for shelter to the mountains, they called to their assistance their brethren in Africa, but before any aid could be had from that quarter, a Moorish sovereign was proclaimed, conquered and beheaded. The Spanish government, emboldened by the weakness of the rebels, refused their submission, and they were banished from the kingdom, conformably to a decree of Philip the Third.

Their expulsion was an act of state policy, of which the consequences were long fatal to the arts, agriculture and commerce of Spain. A Spanish writer thus describes the kingdom of Granada about the beginning of the sixteenth century. "A short time after the conquest of Ferdinand, that rich province contained seventy fortified towns, and Granada alone was peopled by two hundred thousand inhabitants."^c The imposts and produce of the mines in the same part of the Peninsula, were enormous comparatively with what they are at present. The single tax on silk produced a revenue of 181,500 gold ducats.^d It is humiliating to the Spaniards, says an English writer, that the noblest monuments in their country, are those which a hateful race of conquerors left behind them.^e

^a The kingdom was at first called the kingdom of Asturias, and afterwards the kingdom of Leon and Asturias. It continued united as one kingdom till its union with Castile, A. D. 1037.—P.

^b The standard of the cross and the royal standard were hoisted on the walls of Granada, Jan. 2, 1492. The triumphal entry took place Jan. 6.—P.

BOOK CXXXVIII.

EUROPE.

Europe continued.—Spanish Peninsula. Kingdom of Portugal and Algarva.

It may not perhaps be deemed according to rule, to commence the political account of the Peninsula, with that of a kingdom so insignificant as Portugal; but it should be recollected that the same method has been already followed,^a and in a historical point of view, the kingdom of Portugal merits the priority, for it was freed from the Saracens, and in possession of its present limits, long before Spain had shaken off the Mahometan yoke. Henry of Burgundy was created count of *Portocale*, because he assisted the king of Castile in his expeditions against the Moors. About the commencement of the twelfth century, Alphonso Henriquez, the son of the same Henry, received from his soldiers the title of king, after having killed with his own hand five Musulman princes, whose heads occupy a prominent place in the armorial bearings of Portugal.^b It was about the middle of the following century, that Alphonso the Third took Algarva from the Saracens. Free in a land which their courage had delivered from foreign oppression, it was during the same heroic age that the Portuguese emerged from the darkness of barbarism, and betook themselves to the sciences, to navigation, agriculture and trade; they led the way in the career of those memorable discoveries that extended the circle of European communication with Asia and Africa, and afterwards with a vast continent, of which the genius of Columbus had conjectured the existence. In the annals of the middle ages, no nation holds a greater rank than the one that during two centuries, conquered many islands, gave laws on the banks of the Ganges, founded numerous towns and factories in India, covered every sea with its ships, and shared with Spain vast territories, bounded according to the decrees or caprice of a Roman pontiff. If Portugal was invaded by Philip the Second, when the dynasty of Avis became extinct, if it remained sixty years subject to Spain, the colonies it lost during the same period, roused the spirit of the nation, and gave rise in 1640 to a conspiracy, by which the independence of the country was secured, and the crown conferred on a duke of Braganza, the founder of the reigning family. Although comparatively insignificant in point of population, it has shown more than once how

much the strength of a country may be increased by the public spirit of the inhabitants. Recollecting its past glory, it may be expected that, under an enlightened government and a wise policy, it may again occupy no mean station among the kingdoms of Europe.

The kingdom of Portugal extends from north to south, between the forty-second and thirty-seventh parallels, and from east to west, between the ninth and eleventh degrees of longitude. Its political limits on the north are Galicia and part of the province of Zamora; the boundaries on the east are the provinces of Salamanca and Estremadura and the kingdom of Seville.

The natural limits of the same country are a part of the course of the Minho, and the mountains of Penagache and Segondera, on the north; on the east, a part of the Douro, the Turon, the Herjas, a part of the Tagus, the Sever, a portion of the Guadiana, the Chandza, and the lower Guadiana from its junction with the Chandza to its mouth; the ocean forms the southern and western confines of the kingdom. Its greatest length from north to south is equal to a hundred and twenty-five leagues,^c and its greatest breadth from east to west is about fifty. The superficies amounts to four thousand nine hundred and twenty-two square leagues,^d and the population to three million, three hundred and forty thousand inhabitants.

As Portugal is very narrow from north to south, it might be thought that the climate throughout the kingdom was almost uniform; but the inequalities in the soil, the direction of the vallies, and the greater or less proximity of the ocean, have a considerable influence on the temperature. It is sufficient to travel a few leagues to transport oneself from the excessive heat of Lisbon to the cold of Germany. Although the temperature diminishes gradually from the coast to the highest summits, still the laws of increase or diminution are modified by several local causes. Thus, in the high country, in the province of *Tras-os-Montes*, the heat is excessive during summer, and more particularly so in the neighbourhood of Lanego, for the hills of slate near the town, incline to the south, and the Marao forms a barrier against the north wind. Besides, the distance from the sea is so great that the wind from that direction passes with difficulty into the

Tras-os-Montes, and afterwards to the whole kingdom. The most ancient document in which the name of Portugal occurs, bears the date of the year 1069; it is carefully preserved in the monastery of Aroun. See Gaetano de Lima, *Géographie Historique*, tom. i. p. 86.

^c The league mentioned in this work, is equal to the twenty-fifth part of a degree.

^d Geographers differ as to the extent of surface; M. Bory de St. Vincent makes it equal to 3,437½ square leagues—Cheling to 1,642.37 German square miles, or 4,566 square leagues—Franzini to 28,350 miles of sixty to the degree.

The last measurement, which has been adopted by Balbi, seems to be the most correct.

^a M. Bory de St. Vincent, *Guide du Voyageur en Espagne*.

^b Some authors have derived the name of Portugal from *Porto-Gallo* (the French port,) a town in which Henry of Burgundy and his companions resided, and which is now called Oporto or Porto. Other writers affirm that there was an ancient town named *Cale*,* now *Gaya*, at the mouth of the Douro; in course of time, a harbour was constructed opposite to Cale, which received the name of *Portucalet* (the port of Cale,) and became the town of Porto, of which *Cale* or *Gaya* now forms the suburb. It is from the word *Portucale* that the name of *Portucale* was first applied to the present provinces of Minho and

* *Calle*, D'Anv.

† *Portus Callis* or *Porto Calle*. (Ed. Encyc)

country, whilst the confined situation of the valley, and the arid slate-hills exposed to the sun's rays, render it one of the warmest parts of Portugal in the summer season.^a

The lower districts in the same kingdom, possessing the advantages of a very short winter, may be said to have a double spring. The first begins in February; the succeeding months are sometimes cold and rainy, at other times warm and dry. The crops are reaped in June, and by the end of July the plains are scorched, the grass becomes yellow, the trees wither, and it requires much labour and care to preserve esculent vegetables. While the heat along the coast is often more excessive than in the torrid zone, the temperature of the higher regions is cool and mild.^b The low country is adorned with a second vegetation about the end of September or beginning of October. The plants of spring succeed suddenly those of autumn, the meadows are covered with new grass, the trees seem to have resumed their foliage, and the orange groves, then in flower, give to the month of October, all the charms of the finest spring. Winter commences at the end of November, and continues until the month of February; it is the season of much rain and violent hurricanes; the torrents then make a passage for themselves to the rivers, while the latter overflow their banks, and the ordinary communications between different parts of the kingdom are interrupted. But the cold is never rigorous, and it rarely freezes, in the low country. Still the frost is sufficiently keen in the mountains of *Tras-os-Montes* beyond the *Douro*, and also on the summits of the *Serra de Estrella*, the *Serra de Manes* and the *Serra de Estreiros*; although the snow accumulates, the rivers are seldom frozen. The Portuguese affirm that snow lies during the greatest heat of summer on the summit of the *Gaviarra* in the province of *Minho*, in some cavities of the *Marao*, and on the tops of the *Estrella*. But snow does not remain more than a month on the other mountains, and it is altogether unknown in the kingdom of *Algarva*. The north wind prevails in winter in the provinces of *Tras-os-Montes* and *Entre Douro e Minho*, and the south-west wind in those of *Beira*, *Estremadura* and *Alentejo* during the same season. The greatest cold is generally accompanied with the east wind, which passes over the snowy summits of *Castile*. In the other seasons, and particularly in summer, the north-west wind blows in the morning, and the south-west in the afternoon.

According to a well informed observer,^c the winter at *Lisbon* and in the basin near the mouth of the *Tagus*, continues during *December*, *January*, *February* and *March*; *April* and *May* are the two months of spring; the summer lasts from the beginning of *June* to the end of *September*, and the autumn from the first of *October* to the end of *November*. The basin of the *Mondego* in the neighbourhood of *Coimbra*, is more temperate than *Lisbon*, but it is also more humid and less salubrious. The climate of *Oporto* and *Penafiel* is equally humid, but the winters are colder and more cloudy, while the summers on the contrary are very warm. The winters are very mild in the kingdom of *Algarva*; the meadows are always enamelled with flowers. Rain is unfrequent during the months of *July*, *August* and *September*. If *October* be a rainy month, it is not uncommon to see the fruit trees blossom anew in *November*. *December* and *January* are the wettest months, and abundant rains in *April* are the signs

of a plentiful harvest. A remarkable fact in the history of atmospheric phenomena may be mentioned; in the month of *May* the wind follows generally the direction of the sun, or in other words, it blows from the east at sunrise, from the south at mid-day, from the north-west in the evening, and from the north during the night.^d

Although Portugal be a mountainous country, it is seldom exposed to violent storms; thunder is only heard during the autumn and winter.

Having entered into sufficient details concerning the temperature, a few remarks may be offered on the salubrity of the climate. Portugal is justly celebrated on this account in England, and many examples of longevity prove that the opinion, unlike many of the same nature, is not founded on prejudice. Among the places noted for their salubrity are *Braga*, *Ponte de Lima*, and almost all the others in the province of *Minho*. *Mirandella*, *Villa Pouca*, *Montalegre*, and several other towns in *Tras-os-Montes* are equally healthy. The same remark is applicable to the upper valley of the *Mondego* in the centre of the kingdom, or to the country between *Guarda* and *Ponte de Marcella*. *Ourem*, *Loures* and *Lisbon* in *Estremadura*, *Beja*, *Evora* and *Ourique* in *Alentejo*, and *Monchique*, *Faro* and *Tavira* in *Algarva*, have been commended for the same reason by the Portuguese. But many parts of the country, particularly such as are humid and marshy, are considered unwholesome. The inhabitants of *Quarteira*, *Lagos*, *Silves* and *San Marcos de Asserra* in *Algarva*, as well as those of *Silveiras* and *Monte-Mor-o-Novo* in *Alentejo*, are subject to different maladies, attributable to local causes. *Pezo de Regoa*, *Chaves*, *Braganza* and *Miranda* in *Tras-os-Montes* possess a sad celebrity. The same may be said of *Almeirim* in *Estremadura*, and almost all the southern bank of the *Tagus* between the *Rio-Almanzor* and the country near *Lisbon*, and of the southern declivities of the *Estrella*, and the lands watered by the *Mondego* from *Coimbra* to *Figueira* in the province of *Beira*.

Some diseases are most prevalent in particular situations; thus at *Lisbon*, apoplexy, paralysis, and complaints of the liver and breast, are more common than in other parts of the country, and the variations of temperature occasion different sorts of fevers, and other diseases produced by suppressed perspiration. The people in the northern provinces are subject to rheumatism and pleurisy, and the salt marshes on the coast produce obstructions and dropsy. A sort of leprosy attacks the working classes in *Beira*, and intermittent fevers, dropsy and anthrax^e are not unfrequent in *Alentejo*; lastly, the inhabitants of *Algarva* are exposed to gastric fevers, and to a certain inflammation known by the name of *mal de Bariga*, which medical men attribute to the great quantity of unripe figs that constitute the principal food of the lower orders during three or four months in the year.^f

The frequency of earthquakes may be considered the greatest calamity to which the southern part of Portugal is exposed; a year seldom passes away without the recurrence of several shocks, and since the eleventh century *Lisbon* has been fifteen times more or less injured. It has been observed that they happen between the months of *October* and *April*, and particularly after the first rains that succeed the heat and droughts. These facts are important, inasmuch as they

^a Ad. Balbi, *Essai Statistique sur le Royaume de Portugal et d'Algarve*, tom. i.

^b The difference of temperature between the coasts and the high country is about ten degrees of Fahrenheit, or four and a half of Reaumur.

^c Colonel *Franzini*, cited by *Balbi*.

^d This wind is called *Vento Rodeiro* (turning wind) by the natives.

^e Carbuncle.

^f Ad. Balbi, *Essai Statistique*.

prove an invisible relation between the atmospheric phenomena and those taking place in the depths of the earth. The data hitherto collected concerning volcanoes and the shocks which they produce, are extremely vague; but enough is known to prove that the subterranean communications in which they are developed, extend to a great distance, since the famous earthquake that overturned Lisbon in 1755, was felt almost at the same instant in Africa, Ireland and America.

It would be incorrect to estimate the mineral wealth of Portugal from the inconsiderable profits gained by the inhabitants; a more accurate notion of its value and importance may be inferred from the facts recently published by M. Balbi. Few countries in Europe have a greater number of mineral springs: there are ten in the province of Minho, six in Tras-os-Montes, seventeen in Beira, twelve in Estremadura, nine in Alentejo, and two in Algarva. These are either gaseous, saline, sulphureous, ferruginous or merely warm; all of them are of a temperature more or less elevated. The Carthaginians obtained their metals from the same country; it still possesses mines of gold, silver, iron, lead and tin; but it is now dependent on foreigners for these substances, which, if well worked, might form a lucrative branch of exportation. The coal mines are for the most part neglected; the salt marshes are alone worked with profit; the number of workmen employed in them, thirty years ago, was equal to five thousand four hundred, and the annual quantity of salt to 384,000 casks; but much less of the same article is now exported; the annual produce does not exceed 140,000 casks, of which the value in English money may be estimated at L.100,000.^a

Agriculture is in a less advanced state than in most of the corn countries in Europe; a quantity sufficient for the consumption of the inhabitants is not produced in the kingdom; on an average, 150,000 measures^b of grain are imported every year, and it costs more than L.1,500,000.^c It may be added too, that only a sixth part of the imported grain is brought from the Portuguese colonies. M. Balbi, however, believes that enough is produced in ordinary years to maintain the inhabitants; he attributes the necessity of importation to the consumption at Lisbon, into which place, from the want of roads, supplies cannot be brought from the interior. The same cause is not without its influence on the agriculture of the country; the freedom of the port at Lisbon serves only to aggravate the evil, inasmuch as foreign corn is thus attracted into the kingdom. Other causes retard the development of agricultural industry; it may be sufficient to mention the heavy imposts to which the peasantry are subject, the great number of privileged estates belonging to the crown, the nobility, the church and different towns, the want of hands occasioned by the military service, which falls principally on the inhabitants of the country, and also a common custom among the nobility, that of not living on their estates, but of letting them on long leases to farmers, who subset them to labourers; lastly, the want of communications, occasioned by the bad state of the roads. Government has endeavoured to put an end to all these abuses;

^a "The number of workmen, thirty years ago, amounted to more than 5400, and the annual produce to 384,000 *muids*, [a measure equivalent to 68.725 Eng. bushels nearly.—*Encyc. Method. Commerce, art. Mesures.*] The exportation of salt has since undergone a sensible diminution; it amounts at present only to 140,000 *muids* annually, of which the value in French money is estimated at 3,200,000 francs."—P.

^b "Muids."

^c "36,000,000 francs."

^d "280,000 quintals of codfish (*morue*.)"

but civil dissensions and an impoverished treasury have hitherto prevented the proposed improvements.

The wretched state of agriculture must have necessarily some effect both on the number and quality of the cattle, and the same effect operates in its turn on the culture of the soil. The days on which the people abstain from butcher's meat, make up nearly a third part of the year; hence they are obliged to receive annually from foreigners 280,000 hundred weights of dried or salted fish,^d an article which costs them every year about L.415,000.^e The bad quality of the pasturage, which the husbandman is not anxious to improve, and the little profit he derives from his milk, being unable to convert it into butter or cheese, account sufficiently for the dependence of Portugal on its neighbours.^f The oil obtained from its neglected olives is so ill made that it cannot be a source of profit; indeed, if the quantity of the same article which is imported, be compared with the quantity exported, it may be found that the former exceeds the latter in value by L.5000. Under better management, Portugal could not only supply her colonies but several foreign countries with oil.

The provinces of Minho, Tras-os-Montes and Beira are fruitful, but chiefly in grain. The greater part of Estremadura and Algarva remains uncultivated; the principal products of the last province consist in figs and almonds. Pears and apples are cultivated in the other parts of the country; chestnuts abound everywhere, and those of Colares and Portalegre are as much extolled as the figs of Almada. Estremadura is enriched by the sale of oranges and lemons, which are prized in every country. The wines of Portugal are not less celebrated; that of the upper Douro is well known in England by the name of port; the others are the muscadine wines of Carcavelos and Setubal, and the white wines of Algarva. Portugal exports annually almonds and dried figs, of which the ordinary value may be about L.21,000, oranges to the amount of L.84,000, and 47,000 pipes of wine, worth more than L.1,830,000.^g

It has excited surprise that the country people understand so little about rearing silk worms and bees; if these branches of rural economy were better known, the inhabitants might add considerably to their wealth. The other products of the animal kingdom are equally neglected. The sheep might be much improved; the flocks are numerous, particularly in the province of Beira, from which they are driven in the winter season into Alentejo. The wool, indeed, is less valuable than that of Spain; still it is purchased by strangers, but the quantity exported does not yield more than L.17,000.^h The horses are inferior to those of Castile and Andalusia; although small, they are light and well made; it requires only a moderate degree of care to improve the breed, and to increase the number, which at present is very inconsiderable. The mules are not numerous, but of a good kind, large, strong and docile.

Wolves haunt the forests and the mountains, and the wild cat frequents the desert lands. Wild goats, although less common than formerly, are not unfrequently seen in the Serra de Gerez. The stag, the roeⁱ and the wild boar

ⁱ "Daim" (*Cervus Dama*), the fallow deer.

appear sometimes in the woods; hares are rare, and rabbits less numerous than in Spain. According to an author, on whose accuracy we rely,^a the insects of northern Africa are found on the heaths, the butterflies, common to the south of France, on the sides of the Estrella, and the beetles of the north on the heights of Tras-os-Montes. Vipers and other venomous reptiles are concealed in the mountains; it is not uncommon to observe in the fields, and even in the houses, the Mauritanian cordylus,^b an animal which the Portuguese abhor, attributing to it qualities that it does not possess, and not appreciating the services it renders by destroying many hurtful insects.

The rivers and coasts abound in fish of every sort; shad, eels, sardel, soles and flounders are taken in great plenty; some of the other kinds are the *Muræna ophis*, the *Scomber pelamis*^c and the *Xiphias gladius*.^d From such abundance Portugal might derive its principal wealth, but government has neglected these important fishings. Three centuries ago Portuguese fishermen competed with the Dutch on the shores of Newfoundland, but at present they can hardly explore their own coasts. Although their trade requires a considerable outlay, although the taxes on the produce of their industry are excessive, and in short, although poor and wretched, their number amounted some years ago to more than 18,000: but many, it is said, unable to live in their own land, seek the means of subsistence in the American or English navy.

Different writers have affirmed that the Portuguese are degraded by ignorance and superstition. A few remarks on the religion, manners and literature of the people, may serve perhaps to dissipate errors which have been often repeated. Of late years greater toleration has been shown in Portugal, as well as in most states under the influence of European civilization. The Catholic is the established religion, but others are tolerated. The principles published by the Cortes in 1821, have effected this happy change; the tribunal of the inquisition was then abolished, which indeed had long derived no support from public opinion. The number of ecclesiastics was greatly exaggerated by the geographers of the last century, and writers of the first merit have believed and repeated their blunders.^e It might be proved, however, by correct data, published many years ago, and since confirmed by more recent details, that the total number of those in holy orders, including the members of the secular clergy, as well as the persons of both sexes in the monasteries, cannot be more than 29,000 individuals.^f The higher

^c Bonito.

^d Sword fish.

^e In the article Portugal, in the *Dictionnaire d'Economie Politique de l'Encyclopédie Méthodique*, the number of ecclesiastics is said to exceed 300,000 individuals.

Bourgoing, in his *Nouveau Voyage en Espagne*, (Paris, 1797, 3 vols. 8vo.) and Dumouriez, in his *Etat présent du Portugal*, (1 vol. 4to. 1797,) estimate the number in holy orders at 200,000.

M. de Laborde made the number amount in 1808, to 280,000.

M. Bory de St. Vincent, in his *Guide du Voyageur en Espagne*, (1823,) supposes them equal to more than 200,000.

^f The above number, the result of M. Balbi's calculation in his *Statistique du Portugal*, is not below the truth, and we believe indeed that its tendency is to diminish rather than to remain stationary. It is remarkable, that the same mistake has been so often committed, more

particularly as from the number of convents, the number of their inmates might have been easily calculated. In the year 1790, according to Stein's Geography, there were 418 convents for men, and 108 for women. It is known that the mean number of persons for each convent is sixteen; therefore it may be easily shown that in the same year the total number of individuals in all the convents did not exceed 8416. But the convents have been since reduced to 363; thus there are now in Portugal only 5808 monks and nuns. If the number of those employed in the hospitals be estimated at 100, and it is not more, the result will be 5908. Portugal contains about 4054 parishes; supposing five priests for each parish, the number throughout the kingdom will amount to 20,270, and together with the inhabitants of the convents, to 26,178. Thus it appears we have rather exceeded than underrated the total number in assuming it equal to 29,000.

^g "The archbishop of Braga bears the title of patriarch-primate, a dignity created in 1716." The other archbishops are those of Lisbon (styled patriarch) and Evora.—P.

The portrait of the Portuguese drawn by Du Chatelet,¹ and copied by modern geographers, is any thing but flattering. The people, says that writer, are of a swarthy com-

¹ Travels in Portugal, by J. Murphy, London, 1798. Link, *Bemerkungen auf einer Reise durch Frankreich, Spanien und vorzüglich Portugal*, 1800.

² The work entitled *Voyage du duc Du Chatelet en Portugal*, with notes by Bourgoing, (1798, 2 vols. 8vo.) was written by M. Cormartin, a zealous royalist of La Vendée.

plexion, while their noses are short, and their lips thick; now certainly they are not of a swarthy complexion, neither are short noses nor thick lips characteristic features. They have the complexion of the people in southern Europe; although not of a tall stature, they are in general well made; deformed persons are rarely seen amongst them. The finest and strongest men in the kingdom are those in the provinces of Minho and Tras-os-Montes, and on the mountains of Estrella; they have generally fair complexions and light or chestnut hair; in the other provinces black is the prevailing colour of the hair. Long black hair, a fine complexion, large black eyes, and white and regular teeth, might render the Portuguese women the most attractive in Europe, if with the gayety of the French, they united the dignity of the Spaniards.

The vivacity and warm imagination which distinguish the Portuguese, are probably the causes of their eagerness after pleasure. The theatre, music, dancing, processions, bull fights, in short, whatever can gratify the senses, have to them irresistible charms. Their lively music is not unpleasing to strangers; the popular songs, accompanied with the guitar, are light and graceful, but in most of them the words are too licentious. The national dance or the *Foffa* is so lascivious that every stranger who sees it, must deplore the corruption of the people, and regret to find such exhibitions permitted not only in the country, but in the heart of towns, and even on the stage.

The Portuguese language, formed from that of the ancient Turdetani and the Latin,^a was once, like the other Italic tongues, a barbarous dialect; Arabic words were introduced into it under the domination of the Moors, and afterwards French vocables, when Count Henry of Burgundy settled in Portugal with his comrades. It acquired greater regularity during the thirteenth and fourteenth centuries, and in the sixteenth, that softness and energy were united, which have been so justly admired in the verses of Camoens. Since the same period the Portuguese language has degenerated; the usurpation of the throne by Philip the Second hastened its decline. Despotism checked the flight of genius, and repressed the utterance of generous thoughts; servility substituted the language of flattery for that of truth, and thus the sentiments as well as the language of the people were degraded. The Portuguese has not the guttural sounds of the Spanish; it is rich and sonorous, but the frequency of nasal terminations, and the facility with which the words of other languages may be adopted, weaken its harmony; had not several modern writers proved the contrary, it might be supposed from the last defect, that it was not rich in vocables.^{b c}

It is a common error to condemn Portuguese literature, because it happens to be little known in Europe. The country has produced distinguished men in many departments of knowledge. Some of the poets who have flourished since the time of Camoens, have acquired no ordinary celebrity among their countrymen; if those who have devoted themselves to the dramatic muse, have been unable to raise the Portuguese theatre from the obscurity in which it languishes, it must be admitted on the other hand, that sev-

eral lyric poets are not unworthy of the fame which has been conferred on them. Citizens became legislators during the last political struggles, and although the mass of the people were incapable of enjoying the wise institutions of Don Pedro, still the knowledge diffused among the higher classes must have one day a salutary influence on the destinies of the kingdom. From data, which we believe correct, it appears that more than a hundred works in the various departments of literature and science are published every year in Portugal.^d The number is certainly greater than might have been inferred from the intellectual state of the people. There was a time when the liberty of the press, and the interest excited by political questions, increased the number of newspapers and journals to more than thirty.

The low state of the fine arts may be attributed to the little encouragement afforded either by the wealthy or by government. Music is almost the only one in which any of the Portuguese have hitherto become eminent. Many facts are not wanting to prove the low state of education among the lower orders; in Spain, indeed, the system of education is much worse; with that exception, however, there is perhaps no other country in Europe where the number of scholars relatively to the population is so inconsiderable. But the places of education for the children of the rich or privileged classes may bear a comparison with any other in Europe. Scientific instruction is committed to able professors, and the labour of the students is facilitated by good elementary works, written in the Portuguese language.

Since the year 1821, the time in which the form of government was changed, Portugal has more than once excited the attention of Europe. The constitution by which the legislative power was committed to the king and the cortes, must form for a long time an epoch in the history of the country. But a real national representation was no innovation in the state, for the establishment of the cortes dates from the eighth century, or from the foundation of the kingdoms of Leon and Castile, and they are repeatedly mentioned in the earliest times of the Portuguese monarchy. These assemblies, which German or Gothic princes formed round their elective thrones, were composed of the great proprietors or barons, to whom the right of conquest gave that of alone constituting themselves into a national body, and who assumed the prerogative of restraining the power of their kings, and confining it within due limits by the refusal of subsidies. With the military nobility, the clergy afterwards united, an order by so much the more powerful, as during the wars against the Moors, the standard of the cross became the banner of independence. The invasion of the Suevi and Visigoths did not destroy in the Spanish Peninsula the duties of those agents whom the Romans appointed in the great towns, and who still exist under the name of *procuradores*; they formed the third class of members that composed the Spanish and Portuguese cortes. These assemblies deliberated on the laws, and regulated the imposts. It was not unusual for them to encroach on the prerogatives of the crown; while the cortes sat at Coimbra in 1387, during the reign of John the First, the deputies of the towns being averse to war with Castile, the king informed

^a The Portuguese and the Galician (*Gallego*) were originally the same language, and are supposed by Sismondi, to have been formed by the mixture of the vulgar Latin or *Romana Rustica* with the languages of the Vandals and Suevi who conquered that part of the Peninsula, while the Spanish or Castilian was formed by the mixture of the Latin with the language of the Visigoths.—P.

^b —“but the frequency of hiatuses and nasal terminations, the pro-

pensity to neologism, and the facility with which the words of other languages are adopted, weaken its harmony, and if many modern writers had not proved the contrary, would lead one to suppose, that it was poor in its vocabulary.”

^c Ad. Balbi, Atlas ethnographique du Globe.

^d Essai Statistique du Portugal.

them that he would conclude a peace, or continue the war, according to the advice of the people. Lastly, they exercised an authority which at the present day might be considered revolutionary in some countries, for in a period of 525 years, the Portuguese cortes elected five kings; namely, Alphonso the First, count of Portugal, Alphonso the Third after the deposition of his brother Sancho the Second by the pope, John the First after the extinction of the legitimate branch of the Burgundian dynasty, John the Fourth of Braganza after the expulsion of the Spaniards, and Peter the Second, in 1667, after Alphonso the Sixth was declared incapable of reigning. Had every class of the community been represented in the cortes, and had it been made imperative on the sovereign to convoke such assemblies, the people need not have envied the English constitution; but the kings of Portugal have dispensed with them since the year 1697. Such was the state of the kingdom in 1821, when a new constitution, the work of a new cortes, nominated by electors chosen by all the citizens, established a representative government, equal and even superior in some respects to any of the same kind in Europe.^a The constitution was abolished in 1823; three years afterwards, Don Pedro, the emperor of Brazil, ascended the throne of Portugal, and granted his subjects a representative government, more monarchical in its tendency than the former, but of such a nature as to satisfy the enlightened part of the nation.^b

Having endeavoured to describe the moral and political state of the Portuguese people, it remains for us to mention the principal towns and others which, although inferior in the number of their inhabitants, merit the notice of the traveller or historian. The statistical tables at the end of the present book, may enable the reader to estimate the force and resources of the kingdom.

The port of Lisbon,^c from the magnificent spectacle which it affords, may be compared to any in Europe; mariners consider it one of the best anchoring places in the world. It is defended by fort Bugio, situated on an island at the mouth of the Tagus, and by fort San Juliao on the right bank of the same river. The town rises like an amphitheatre on the right bank, and occupies a space about three leagues in length, and more than one in breadth. The large bay formed by the Tagus, affords only a narrow and dangerous passage for ships; indeed, vessels seldom approach it without being provided with experienced pilots, a precaution rendered necessary by the bar which its waters form against the ocean.

It might be supposed from the sight of this large capital, that it contained many more inhabitants than it really does, but it is well known that the population does not exceed 260,000 souls. It is divided into two towns: the old town is formed by many tortuous, narrow and dirty streets, which were not destroyed during the great calamity in the year 1755; the streets in the new town are broad and straight, and their number is daily increasing. The number of streets in both the towns amounts to 566; there are besides 60 squares, only twelve of which merit the name. The two

most remarkable are the *Praça do Commercio*,^d and the *Praça do Rocio*; the first is bounded on one side by the Tagus, and adorned with fine edifices, such as the exchange, the custom-house, the India-house, the admiralty, the royal library and other buildings, some of which are not yet finished. The second or the *Praça do Rocio*, is smaller than the preceding; it is adjoining the great palace of the Inquisition, in which are now contained the offices of the different ministers, and the prisons of the holy office. If the royal palace in the suburb of Ajuda was completed according to its original plan, it might be doubtful if there would be another in Europe of so large a size. The king of Portugal possesses two other residences in Lisbon, the palace of *Bemposta*, in which he gives audience, and that of *Necessidades*, now set apart for foreign princes. Among the other buildings are the naval arsenal, the college of nobles, the palace of *Calhariz*, now the place in which the academy of sciences hold their meetings, and the theatre of San Carlos, which in point of size at least, may be compared with the secondary theatres in the Italian towns. The principal churches are the cathedral or *Basilica de Santa Maria*, an old edifice that was repaired after the last earthquake, the church belonging to the convent of Jesus, remarkable for the boldness of its dome, and perhaps the finest modern building in Lisbon, and lastly, the church of the martyrs, a monument to the glory of the Portuguese, erected at the place where Alphonso the First defeated the Moors.

Lisbon possesses several useful institutions, but the first in point of importance is the naval observatory, an establishment which has contributed to the advancement of astronomical science. Some of the others are the royal naval academy,^e the royal school of naval architecture, the royal academy of fortification, artillery and drawing, the royal school of surgery, and that of sculpture. We may also mention the commercial school, the royal military college, the college of nobles, and the royal schools in the monastery of St. Vincent de Fora, where the ancient and modern languages, geometry, physics and philosophy are taught. There are, besides these, a royal school of drawing and civil architecture, in which the course of instruction lasts five years, and a musical seminary (*Seminario Musical*), for the purpose of promoting composition and also vocal and instrumental music. The seminaries connected with religion are the royal college of St. Patrick, established in 1590 for the education of Irish missionaries, the royal college of catechumens, founded in 1579 for the instruction of converted infidels in the principles and doctrines of Christianity, the college of St. Anthony and St. Peter for orphans and poor children, and other institutions of the same nature under the direction of the clergy or the different monasteries.^f

The royal academy of sciences at Lisbon, holds the first rank among the scientific institutions in the kingdom. A society for the encouragement of national industry has lately been established in the city. It possesses also public libraries, a botanical garden, a museum of natural history, and different scientific collections, which are much inferior to

^a The cortes alone had the power of originating laws.

^b On the death of John VI., March 1826, the crown devolved by hereditary descent, on Don Pedro, his eldest son, emperor of Brazil, although it has since been contended by the Apostolical party, that by the constitution of Lamego, he had forfeited his right to the crown, as a foreign sovereign. On the 29th April 1826, he granted to Portugal a constitutional charter, and on the 2d May, abdicated the crown in favour of his daughter Donna Maria. Although the charter was supported during the year 1827, by the British troops sent by Mr. Caning, and although it was solemnly sworn to by Don Miguel on his

return in 1828, it was almost immediately after abolished, and the old government restored with an accumulated despotism. Such is the present state of Portugal.—P.

^c Port. *Lisboa*.

^e *Academia real da Marinha*.

^f The royal schools of the congregation of the Oratory, principally for instruction in Latin, and the schools of grammar, rhetoric and philosophy at the royal hospital of *Nossa Senhora de Necessidades*. To these different public institutions, may be added several private establishments.

others of the same kind in the principal capitals of Europe.

It is not more than twenty or thirty years that persons were not safe in the streets of Lisbon; murders were committed in open day, and murderers found protection by flying to the sanctuary; at night passengers were stopped by soldiers who demanded charity, and took by force the money which any ventured to refuse. There were then no patrols nor police to check these disorders; now that the best means are employed to ensure the public safety, murders and even thefts have become very rare.

No edifice in Lisbon can be compared with the aqueduct of Bemfica (*agoas livres*), by which the water that the inhabitants consume, is principally conveyed into the city. It has been considered one of the most magnificent works that has been executed in modern times, and it is certainly not inferior to any ancient work of the same kind. The length of the aqueduct is not less than 56,380 feet; the largest arch is equal to 206 feet in height, and the opening or breadth to 100.^a The country around Lisbon is not only agreeable from the fine sites in different directions, but interesting historical recollections are connected with it. Oeiras, the country seat given by King Joseph to the Marquis of Pombal, was inhabited by the same monarch in 1775, and the minister availed himself of his temporary residence to change a village fair into one of a different kind, where the products of Portuguese industry were exhibited,—an ingenious idea, that has been imitated elsewhere, and has excited a salutary emulation in other countries, particularly in France. Cintra is celebrated for the capitulation, in virtue of which the French army left Portugal in 1808. Mafra on the western side of the chain connected with Monte Junto, is remarkable for the convent, church and palace, built by John the Fifth, in order to fulfil the vow which he had taken before the birth of his son. These three buildings, the work of a foreign architect, and embellished by painters and sculptors of different nations, form, perhaps, the finest edifice in the kingdom. Loires at three leagues from Lisbon, is well known for its plantations of orange trees, which yield the best oranges in Portugal. Campo Grande is a place of resort for the Portuguese nobility; it stands in a plain surrounded with trees and gardens, where in the summer season, the court and the nobles display their equipages. The different places that have just been mentioned, are not privileged towns (*ciudades*), but burghs or small towns without municipalities (*villas*).

Few other towns of any importance are situated in the rest of Estremadura. Leiria, however, may be mentioned; it is not far from the palace of King Denis,^b on whom the Portuguese conferred the title of Great. The convent built by John the First, a noble monument of Norman-Gothic architecture, serves to adorn the burgh of Batalha; within the same building may be seen the mausoleum of its founder, and several dirty chapels destined for the sepulchres of the kings. The large burgh of Santarem built on a hill, and defended by an old fortress, was long the residence of the Portuguese sovereigns. Lastly, Setubal, although it does not possess the rank of a city, may be considered an important town. Some antiquaries suppose that Troja, a headland at a short distance from the mouth of the Sado, where

several remains of antiquity have been discovered, was the site of a Phœnician colony.

Coimbra is situated in the province of Beira, on the declivity of a hill which commands the Mondego. The interior of the town may be said to be as dismal as the neighbouring country is agreeable. It was a place of considerable importance under the Romans, the Alans and the Moors; it is the capital of the province, and its public buildings, the number of its useful institutions, together with the celebrity of its university, render it not unworthy of its title. The small town of Aveiro at the mouth of the Vouga, is beginning to recover the maritime importance which it seemed to have for ever lost. The ancient city of Viseu,^c situated in the mountains from which the Mondego takes its source, is the residence of a bishop, and carries on a considerable trade in cloth and jewellery. Lamego lies at the northern extremity of the province, in a fruitful district between Mount Penude and the river Douro. It was there that the cortes met in 1144, and the same assembly established a constitution by which the royal authority was confined within due limits,—a constitution that Alphonso the First swore to maintain in the name of his successors.

The province of Entre Douro e Minho is smaller than either of the two last; Braga, the metropolis, stands on a height between the Cavado and the Destc. The principal buildings are the archbishop's palace, the seminary and the cathedral; there are besides several imposing remains of Roman grandeur. Porto or Oporto,^d the second town in the kingdom, rises on a magnificent site at the mouth of the Douro, on two hills called the *Se* and the *Victoria*.^e It consists of the low and the high town; it is divided into five quarters, two of which are encompassed with a wall thirty feet in height, while the three others are open. Twelve large squares, several fine churches, and different public buildings, such as the court of appeal, the town-house, the diocesan palace, the royal hospital and extensive store-houses for its wines, are among the ornaments of this commercial city. Guimaraens, an industrious town, was in ancient times the capital of the kingdom.

Miranda, formerly *Cambetum Lubicanarum*,^f a small episcopal city, is the chief town in Tras-os-Montes. Moncorvo, the ancient *Forum Narbasorum*, is ill built, but contains twice as many inhabitants as the last town. Braganza or Bragança, the ancient *Brigantium*, rises in the midst of a fruitful plain. It was within its walls that Don Pedro, the Justiciary, married secretly the unfortunate Inez de Castro.^g Chaves is built on a height near the Tamega, which flows under a bridge of eighteen arches, built by Trajan; the place was celebrated in the time of the Romans for its mineral waters, which they called *Aquæ Flaviæ Turodorum*.

Alentejo^h is not less mountainous than Beira; although more extensive, it is three times less populous, and being the poorest province in the kingdom, it may be readily supposed that it does not contain many important towns. Evora, the capital and the chief town in the diocese of an archbishop, is styled the second city in Portugal. The population, it is true, does not exceed ten thousand souls, but the vain title has been conferred on it, because several kings made it the place of their residence. It is situated on a height in the chain which forms the continuation of the Serra de Estre-

^a These are the measures of the original. The length differs very greatly from that given by other authorities, (2400 feet, Ed. Encyc. Rees' Cyc.—less than half a mile, Morse.)—P.

mos. The ancient name of *Ebora*, and that of *Cercalis*, as Pliny calls it, announced its prosperity. Flattery induced the municipal magistrates to give it the name of *Liberaltas Julia*. The imperial liberality consisted in building monuments with part of the gold that was exacted from the conquered countries; the remains of some are still to be seen at Evora. The aqueduct attributed to Quintus Sertorius is remarkable for its fine state of preservation. A circular monument at its extremity resembles in the elegance of its proportions, the Lantern of Demosthenes at Athens. The remains of the temple of Diana, distinguished by its fine Corinthian columns, have been converted into the public shambles. Most of the antiquities discovered at Beja, have been collected in a museum. Estremos^a carries on a trade in pottery and earthen vases of a particular kind, so porous that they are used for lowering the temperature of water by promoting evaporation. The ancient town of Elvas, the strongest place in Portugal, rises on a steep hill at two leagues from the right bank of the Guadiana. Some remains of antiquity are still to be observed in Beja, the ancient *Pax Julia*, a town built by the Romans.

Algarva,^b a small province which the Portuguese sovereigns have denominated a kingdom, contains only four towns worthy of notice. Faro, the capital, a well built town, with a harbour at the mouth of the *Valformoso*, exports a great quantity of oranges and other fruits. Tavira is situated on the coast at eight leagues eastwards from Faro; it is almost wholly peopled by fishermen. Villa Nova de Portimao is a small but well-frequented sea-port at the distance of ten leagues to the west of Faro. Lagos^c in the middle of a fruitful district, possesses a harbour which according to tradition was dug by the Carthaginians. Sagres owes its name to the *Sacrum Promontorium*, now Cape St. Vincent. Lastly, we may mention the small town of Monchique on the Serra of the same name; its romantic situation and medicinal springs have of late years rendered it a place of resort.

The Portuguese foreign possessions are the Archipelago

of the Azores; the province of Madeira, including Madeira, Porto Santo and other neighbouring islands; the province of Cape Verd, comprehending the islands of Sant-Iago,^d Fogo,^e Brava, San Nicolaõ, Santo Antaõ, Boavista,^f Mayo, San Vicente,^g Sal^h and Santa Luziaⁱ; the Portuguese colony of Senegambia, in which the principal places are Cacheu,^k Bissaõ, Geba, Farim and Zeguichor; the kingdom of Angola and Congo, comprehending Angola and several other stations; a small province consisting of Prince's island and the island of St. Thomas; the province of Mosambique, containing several important factories; and in Asia, the viceroyalty of India, of which Goa is the capital, including the provinces of Salsete and Bardez,^l the governments of Damaõ^m and Diu, the factories of Surat and Macao, and the islands of Timor, Adomera and Oende Menorⁿ in Oceanica.

These insignificant remains of the Portuguese power, and the rising empire of Brazil, of which the independence was rather an advantage than a calamity to the mother country, serve to maintain the commerce of Portugal. The exports which it sends to the same countries, amount in value to L.3,625,000,^o and the articles it derives from them exceed L.3,000,000.^p The imports from other countries may be estimated at L.3,875,000,^q and the exports to them at L.3,000,000.^r As it possesses comparatively few commercial resources in its agriculture, it may be inferred that the products of its manufacturing industry form a considerable item in the sums now specified. It is in reality not so poor in such products as some political economists have supposed. No comparison can be made between its manufactures and those of more industrious states; but if, notwithstanding the privileges England enjoys, the Portuguese have been able to compete with the English in different manufactures, it may be concluded that industry cannot be at a very low ebb; on the contrary, judicious encouragement and a better system of policy are only wanting to bring it to a high degree of perfection. The reader may form a tolerably correct opinion of the sources of Portuguese wealth from the following tables.

^a Estremoz, Extremos.

^b Algarve, Algarves.

BOOK CXXXIX.

EUROPE.

Europe continued.—Spanish Peninsula.—Kingdom of Spain.

PELAGIUS raised the standard of the cross, and passed the mountains in Asturia to rescue some portion of Spain from the Moorish yoke. That example of patriotic devotedness was imitated by other chiefs, and the districts restored to Christianity and independence, were erected into several petty kingdoms. Although all of them were united under Ferdinand and Isabella, the different crowns retained their titles and geographical limits, as well as certain privileges which serve to recal the glorious epoch of their origin, and to account for the ancient division of Spain into fourteen principal provinces, which are still denominated kingdoms and principalities, and nearly all of which are subdivided into smaller provinces.

The superficial extent of Spain, and the limits by which it is separated from Portugal have been already mentioned; we shall now proceed to give an account of its population and government, of the manners and customs of the inhabitants, of their resources and commerce, and in short, of whatever constitutes the strength or weakness of the nation.

According to the latest work published in Spain, on the geography of that country,^a its population, together with that of the Balears, amounted in 1826 to 13,902,234 individuals, including the clergy, the naval and military forces, mendicants, prisoners and the people in the work-houses or hospitals. But it is a hopeless task to ascertain the number of inhabitants in Spain; the elements on which the calculation depends, are wanting, for the registers, it is well known, are very inaccurately kept by the curates. The number of ecclesiastics, although many convents were destroyed when the country was in the hands of the French, from the year 1808 to 1814, is nearly equal to 150,000 individuals.

The Catholic religion is the only one acknowledged in the country; the dignitaries are the archbishop of Toledo, also entitled primate of Spain, eight archbishops and fifty-one bishops. There are besides sixty-one cathedral and a hundred and fourteen collegiate churches, of which the canons and abbots are vested with almost episcopal authority.

To judge correctly of the physical and moral character of the Spaniards, it is necessary to examine the different provinces. If it may be so said, the shades are better defined in each Spanish province than in other European kingdoms, because the low state of industry, the want of roads, and the natural barriers that separate the different districts are so many obstacles to that frequent intercourse and com-

munication which diffuse a uniform character over a whole population. Thus he who traverses Spain in different directions, cannot fail to observe the light and graceful forms of the Biscayans, the lofty stature of the Galicians and Catalonians, the strength of the Castilians, the dark complexions of the Estremadurans, and the paleness of the Murcians. The women are, in general, graceful and well made; if their beauty has been much commended, it may perhaps be attributed to their animated and expressive features. Differences not less obvious are observable in the moral character of the people in the different provinces. The Biscayans are haughty, irascible and passionate;^b the Galicians are melancholy and unsocial, but laborious and brave; the Catalonians are impetuous and indocile, but indefatigable; the inhabitants of Arragon are devoted to their country, and attached to its ancient customs; the Castilians are grave and proud, the Estremadurans indolent and vain; the Andalusians may be remarked for their arrogance, they have been called the Gascons of Spain; the Murcians are slow and dull, and the most ignorant and at the same time the most suspicious people in the Peninsula; the Valencians, on the other hand, are gay and inconstant, affable and industrious. As to the people generally,^c the most marked traits in the Spanish character are circumspection, pride, honesty, great patience and resolution in their undertakings, and an aversion to every improvement unless its utility be very apparent.

It may be inferred from the penetration and perseverance of the Spaniards that they would have excelled in the culture of the exact sciences, but the impulse given to natural philosophy was checked by the inquisition. Thus, the road was shut to the most attractive departments of knowledge, and the brilliant imagination of the people exhausted itself in the culture of letters. The most ancient romances form a part of Spanish literature; at an early period it consisted principally of such works and the national songs recording the great achievements of the Cid. The Spanish language is expressive and harmonious, although several guttural sounds have been introduced from the Arabic. It may be divided into five dialects, of which the most ancient is still spoken in the kingdom of Leon and the Asturias, but the dialect of Toledo^d is the purest and the one most generally used since the time of Charles the Fifth. The same dialect has been immortalized by the inimitable Cervantes, by Quevedo, who to the graces of art unites the sublimity of genius, by Guevara, from whom Le Sage has borrowed one of his tales,^e by Lope de Vega, the author of 1800 plays and nu-

^a Don Sebastian de Miñano, Diccionario Geografico-estadístico de España y Portugal.

merous fugitive poems, and by the celebrated Calderon, whose comedies have formed the groundwork of a thousand others.

Little attention has been paid to science in Spain; indeed it is only possible to mention a few learned lawyers, well informed physicians, laborious botanists and uselessly profound theologians. Spain has however made greater advances in the fine arts; it has produced engravers little inferior to any of Italy or the Netherlands. In painting, Murillo almost rivals Van-Dyck; Coello has been compared to Paul Veronese, and the graceful Coreno enjoys the title of the Spanish Titian.^a Herrera, Arnal and Juan Bautista de Toledo hold the first rank among Spanish architects; Mena, Alvares and Toledo among sculptors.

Before Charles the Fifth succeeded to the throne of Spain, the government was a limited monarchy; the powers of the crown were restrained by the cortes, those provincial assemblies of which the origin has been already explained,^b and in which the privileged classes were only represented. The privileges of these assemblies were gradually destroyed by the princes of the houses of Austria and Bourbon. Their power and influence had been wholly abolished long before 1808, when Napoleon compelled Charles the Fourth and his son Ferdinand the Seventh to renounce all the claims which they or their successors might have to the crown, and proclaimed his brother Joseph, king of Spain and the Indies. The obstinate and brave resistance of the Spanish people against a foreign usurper, gave additional courage to the members of the provincial juntas, to whom the direction of the war was committed. The most important of these assemblies was held at Cadiz, where the members established a council of regency, to which they resigned their authority; an extraordinary cortes was soon afterwards convoked, and that constitution framed, which although very defective was acknowledged in 1812 by the powers leagued against France. To reward the heroic efforts of the Spaniards in the cause of independence, Ferdinand swore to maintain the constitution; being at liberty to modify or improve it, he disregarded his oath, and the constitution was abolished. The inquisition had been suppressed, that odious tribunal was called anew into existence; the members of the cortes had been declared inviolable, the king sent them into exile. Discontent succeeded the enthusiasm that had accompanied the return of the sovereign; insurrections extended through the country, and on the first of January 1820, the constitution of the cortes was proclaimed by the army in the island of Leon. Such were the conditions offered to Ferdinand, and he was obliged to accept them; he requested the right of modifying the constitution, but the eagerness with which he had formerly abolished it, occasioned distrust, and the constitution was declared unalterable. At the same time, the partisans of absolute power busied themselves in exciting the people, and in creating disturbances in which ecclesiastics and monks were not ashamed to take a part inconsistent with their duty, and disgraceful to their sacred character. The French cabinet, on the supposition that the Spaniards were not sufficiently enlightened to

enjoy the blessings of a representative government, thought fit to interfere and to restore the ancient system. The Duke of Angouleme having entered Spain at the head of an army which was nowhere opposed by the intrepid bands, so formidable in the time of Napoleon, dissolved the cortes, and liberated the king. The memorable ordinance of Andujar was passed by the same general; thus giving an example of great moderation, in wishing no other recompense for the treasures that France had spent, than the safety and protection of those who had supported the constitutional government. It is almost unnecessary to add that his intentions were never carried into effect.

The king possesses at present an unlimited authority; different councils have been created, but the most important is the council of state, formed in the year 1825. Justice is administered throughout the kingdom by supreme courts that are held in the metropolis of each province. The courts of Valladolid and Granada are entitled *chanceries*, that of Navarre is called a *council*, and the rest tribunals (*audiencias*.) The captain-generals of the provinces are *ex officio* the presidents of the courts. Whatever may tend to recal the time of the cortes has been abolished; that the people may believe all authority to be centred in the king, the towns are no longer suffered to elect their mayors or magistrates; this privilege, the last of all those which served to remind the Spaniards of a better system, was taken away in 1823.

Industry and agriculture, long neglected in Spain, cannot be supposed to have made much progress during the last twenty years of wars and revolutions to which that unhappy country has been exposed. The swarms of locusts that ravage the fields, are a minor evil, if compared with the obstinacy and prejudices of the husbandmen. Foreigners attribute incorrectly the low state of agriculture to the indolence of the people; such an opinion, says Miñano, has never been entertained by those who have seen the Spaniards toiling and labouring in the almost inaccessible mountains of the Asturias, Galicia and Catalonia, or in the arid ravines of Guipuscoa, Biscay and Navarre, in the marshes of Valencia, or in the burning plains of Andalusia and Estremadura. The men, who endure so much fatigue for so small wages, cannot be thought either indolent or indifferent.

Spain, one of the most fruitful countries in Europe, might also from the variety of its products be considered one of the most wealthy; wheat, rye, barley, maize and hemp are cultivated in almost all the provinces, but although the abstinence and frugality of the people are proverbial, the crops are hardly sufficient for the consumption.^c Wheat is most common in Leon, Estremadura, the two Castiles, Arragon, Andalusia and Murcia. Rye is more generally cultivated in Biscay, Navarre and Catalonia. Oats are neglected or despised; instead of that grain, the Spaniards, particularly in the kingdoms of Granada and Seville, give barley to their cattle. The inhabitants of Galicia cultivate flax, a plant that does not appear to be very common in the other provinces. Oil and soda^d are the principal products of the southern provinces, particularly along the shores of the Mediterranean;

also exported from Spain, especially from Leon and Old Castile, by the ports of Galicia and Biscay. This export might be greatly increased, were it not for the imperfect state of the roads leading to the seaports, which are hardly passable for carriages, so that the grain is chiefly conveyed on the backs of mules. Large quantities of Spanish wheat are sent to the Havanna, its importation being favoured there by discriminating duties.—P.

^d Barilla.

^a "Morales, who painted only religious subjects, has been called the divine"—*El Divino*.

^b See the preceding book.

^c Spain produces a great quantity of wheat, of an excellent quality, much superior to that in the more northern countries of Europe. The principal wheat districts are Andalusia, Old Castile, Arragon and Murcia, which produce a sufficient surplus to supply the demands of the other parts of the kingdom. Considerable quantities of wheat are

the other products are broom, sumach and different esculent plants of an admirable quality. In the same part of the country are seen whole fields of saffron, the rice plantations appear like so many waving plains, and the cotton shrub thrives as well as on its aboriginal soil. The mulberry trees are very luxuriant, and their leaves afford rich nourishment to the bombyx; it is thus easy to explain why the silk it secretes is so valuable. Rice is most abundant in Catalonia and in the kingdom of Valencia. The latter province and Andalusia are the finest in Spain; trees of different sorts are covered with delicious fruit, the sugar-cane grows beside the cotton plant, and numerous olive-trees furnish the oil that forms at present an important branch of commerce. Honey and different vegetables useful in dyeing also add to the resources of that part of Spain. The honey in the province of Cuenca was celebrated in the time of the Romans for its whiteness and agreeable flavour, on account of which it was called *mel rosamarinum*. Anise, maize, salt and the esparto grass^a from which mats and cordage are manufactured, form the principal riches of Murcia; barilla,^b the plant from which the inhabitants extract soda, is almost confined to Valencia, a province that has been styled from its culture, the garden of Spain. The lands in Arragon near the Ebro abound in grain, saffron, hemp, olives and different fruits; the forests too are well kept; but at a distance from the river, the soil is arid, and the greater part of it uncultivated. Navarre may be distinguished by its extensive vallies covered with rich pastures. The Vasconian provinces^c and particularly Biscay are remarkable for their fertility and the industry of their inhabitants. The food of the peasantry in Galicia consists principally of maize, chestnuts and potatoes; the last plant was first imported into the same province, from which it has been diffused throughout Europe. Naval timber is obtained from the forests in the Asturias, and numerous herds are fattened in the pastures. As to the two Castiles, the old province is arid and sterile, the new is warmer and not so unfruitful.

The lands in almost every part of Spain are favourable to the culture of the vine. The excess of the vintage above the quantity consumed in the country, forms a considerable branch of the export trade, and it might be still much more important, if in making the wine and cultivating the grape, the people availed themselves of the improvements that have been known to chemists and agriculturists during more than twenty years.^d The best wines are those of *Peralta* in Navarre, *Ribadavia* and *Betanzos* in Galicia, *Manzanares* and *Val de Peñas* in La Mancha, *Xeres*, *San Lucar* and *Rota* in the kingdom of Seville, *Cabra*, *Lucena* and almost all the district of *Campine* in Cordova, *Malaga* in Granada, *Carthagena* in Murcia, and lastly *Alicante* in Valencia. Although some of these wines are held in great estimation, the quantity exported bears no proportion to the brandy that is sent from the same parts of the country to the different ports in Spain.

^d See Miñano's Geographical and Statistical Dictionary, article SPAIN.

^e The Mesta is a society that meets every year, the president of which is a counsellor of state, and the members are the owners of the numerous flocks that are conducted for the sake of pasturage into different provinces. ["The Mesta is an incorporated company of proprietors of migratory sheep, who are endowed with particular privileges highly prejudicial to the interests of agriculture. This as-

The little profit that Spain now receives from its wool, affords a sad contrast to the treasures it derived from the same article at a very early period. It would not be easy to enumerate the fatal effects of the war which France maintained against the Spaniards during the imperial government, and if it were at all necessary to account for the decay in the wool trade, other causes that have contributed in a greater or less degree, might also be mentioned. Now that Spanish sheep are imported into France and other countries where the breed is perpetuated, it is difficult to conceive that Spain can ever again arrive at the same pre-eminence in the same trade. But as it has been proved that the merinos are fraudulently exported, it cannot be doubted that such an evil might be checked by a wise administration; if it were prevented and greater encouragement afforded to the woollen manufactures, Spain might at least afford to produce articles equally good and at as moderate prices as any of her rivals. The breed of sheep, it is not less certain, might be still more improved in the same country, and the privileges of the *Mesta*^e need not interfere with the interests of the landed proprietor. The merinos are divided into two classes, those that are stationary, and those that migrate; the former amount in all to at least 8,000,000; the number of the latter, including the flocks that belong to the clergy as well as to the laymen, is still greater.^f Two shepherds drive a flock of a thousand or twelve hundred merinos; they leave the heights of Old Castile in the month of October, and lay waste the plains of Estremadura and Andalusia until the month of May, when the sheep are driven back to the mountains. There are not less than sixteen thousand shepherd herds,^g almost as ignorant as their flocks; they exercise a despotic authority, and commit many abuses in the districts through which they pass. The length of their stay in any part of the country depends on the quantity of food they find for their sheep. During their progress, a space equal to 240 feet in breadth is allotted to each flock by the ordinances of the Mesta;^h once arrived at the end of their journey, the sheep are put into the pastures, and the Mesta regulates in a very arbitrary manner the rate of rent payable to the proprietors. The depopulation of certain provinces, and the decay of agriculture have been attributed not without reason to these annual migrations; indeed Biscay, the Asturias, Galicia and Burgos, not being exposed to the same calamity, are better peopled and better cultivated than the provinces to which the shepherds and their flocks resort.

The sheep are shorn after the shepherds have returned to their summer quarters. It is a very busy time, and the greater part of the inhabitants are employed. The work is done in large sheds that may hold a flock of forty or sixty thousand sheep. One may judge of the number of hands employed, since it requires a hundred and twenty-five persons to shear a thousand sheep; some are occupied in cutting the wool, and others in dividing it into four sorts according to the different degrees of fineness. The sheep-

sociation is formed chiefly of the nobles, persons in power, members of rich monasteries, and ecclesiastical chapters." Ed. Encyc.—P.]

^f See the statistical tables at the end of the book.

^g M. Al. de Laborde (Itinér. d'Espagne) estimates their number at forty thousand, but he includes those that remain at home as well as the others who travel.

^h "The sheep pass unmolested over the pastures, belonging to the villages, and the commons which lie in their road, and have a right to feed upon them. They are not, however, allowed to pass over cultivated land, but the proprietors of such lands are obliged to leave for them a path of ninety *varas*, or about eighty-four yards in breadth." Ed. Encyc.—P.

shearing season is not less joyous than the vintage in the most fruitful districts of Spain.

Several parts of the country are ill provided with horned cattle, particularly Catalonia, Arragon, Navarre and Biscay, which depend principally for their supplies on France. Many oxen are fattened in the rich pastures in the central districts of Galicia. Fine cattle are reared in the Asturias, and the cow is there a most useful animal to the peasantry; the milk is converted into butter and cheese; indeed a sufficient quantity of the former might be produced for the consumption of Spain, if the inhabitants knew how to salt or preserve it. The symmetry of the oxen in Andalusia was admired by the ancients; innumerable herds of the same kind may still be seen in its fertile pastures. Pigs are very common on the mountains of Aracena and Constantina, as well as others in the same province, and the bacon of Leon as well as Galicia is much prized throughout Spain; its delicate taste has been attributed to the sweet acorns on which the pigs are fed. Although the mules and horses of the same country are not in so great repute as they once were, the Asturias may still boast of their light and spirited ponies, while the horses of Andalusia retain the strength that distinguishes the Arab breed. The mules in these provinces are hardy and robust, qualities which they derive from the ass, which has degenerated less in Spain than in France.

Almost all the wild animals in southern France are common to Spain. The mountains and plains abound in game; the wild boar, the bear and different kinds of deer are found in the Galician mountains and Asturian forests. Hares, rabbits, red partridges and bustards are common in Andalusia; the wolf still frequents nearly all the wooded and mountainous districts in the country. The chamois and the lynx find shelter in the Pyrenees and the mountains of Cuenca. The musmon^a is found in the kingdom of Murcia, and among the animals in the more southern parts of Spain, the genet, the porcupine, the scorpion, the *truxalis nasutus*^b and the chameleon may be enumerated. A naturalist^c having observed the striking similarity between the zoology of southern Spain and northern Africa, has been led by the analogy to conclude that the continents now separated by the Straits at Gibraltar were once united.

^a "Le Moufflon," the wild sheep—found also in the mountains of Sardinia and Corsica, where it is called *muffoli*—(the *musimon* of Pliny.)—P.

^b *Gryllus nasutus*, Linn.—a species of locust or grasshopper.—P.

^c M. Bory de St. Vincent, Guide du Voyageur en Espagne.

^d According to Bowles, these provinces were exposed to their ravages from 1754 to 1757. See Introduction à l'histoire naturelle et à la géographie physique de l'Espagne. (Traduction de Flavigny, Paris, 1776.)

^e The following are the general divisions:

In the north.

- 1st. The kingdom of Navarre, a province.
- 2d. The three Vasconian or Biscayan provinces.
- 3d. The principality of the Asturias, a province.
- 4th. The kingdom of Galicia, divided into seven provinces.
- 5th. The kingdom of Arragon, a province.
- 6th. The principality of Catalonia, a province.

In the centre.

- 7th. The kingdom of Leon, divided into six provinces.
- 8th. Old Castile, divided into five.
- 9th. Estremadura, a province.
- 10th. New Castile, divided into five provinces.
- 11th. The kingdom of Valencia, a province.

In the south.

- 12th. Andalusia, including the kingdoms of Cordova, Jaen, Seville, Granada, and the *New Populations*,* forming seven provinces.
- 13th. The kingdom of Murcia, a province.

In the Mediterranean

- 14th. The Balearic islands.
- In all forty-one provinces.

* See page 357.

Estremadura and Andalusia are sometimes desolated by swarms of locusts; but it would not be difficult to destroy them, for they are never seen in great numbers until some time after their first appearance; still the opportunity has been usually neglected, and these insects from the plains of Arabia lay waste the country when it is impossible to check the devastation.^d

The rivers as well as the coasts of Spain abound in fish, and it is from this source that Galicia derives the principal part of its wealth. The sardel fisheries are perhaps as valuable as any others in that province. The sardel are salted so as to render them fit for exportation, and very many of them are consumed in Spain, France and the Levant. The tunny fisheries in the same province are also very profitable; indeed the importance of the fisheries on the southern and eastern coasts of Spain, depends on the high prices given for tunnies and anchovies.

Spain admits less of a vague or general description than any other country in Europe. The people in France, England and Italy are distinguished by national characters, of which the colours are too well defined to be ever confounded; but shades more or less obscure mark the Spaniards of the different provinces, and contrasts more or less striking separate them from each other. To mark these shades and contrasts, and to ascertain their influence on the moral and intellectual character of the Spanish people, has hitherto proved a stumbling-block to many who have attempted to describe Spain, or to compare the Spaniards with the inhabitants of other countries in Europe. To give an accurate description therefore, or at least one free from incorrect generalities, it is necessary that each division or province in Spain should be separately examined.

The kingdom is divided into fourteen principal parts, each of which has its authorities or separate administration, and several are subdivided into smaller provinces.^e The disadvantages of what has been termed *centralization*^f are not felt in Spain, an evil that exists in France, and which most Frenchmen would wish to see abolished.

The kingdom of Navarre is separated from France by the Pyrenees; it is bounded on the east by Arragon, on the south by Old Castile, and on the west by the Biscayan

Spain was divided in 1822, conformably to a decree of the Cortes, into fifty-one provinces.

Navarre was at the same time called the province of *Pampeluna*.

The three provinces of *Vittoria*, *San Sebastian* and *Bilboa*, were included in the Biscays.

One province, or that of *Oriedo*, in the Asturias.

Those of *Corunna*, *Lugo*, *Vigo* and *Orense*, in Galicia.

Those of *Villafranca*, *Leon*, *Zamora*, *Salamanca* and *Palencia*, in the kingdom of Leon.

Those of *Santander*, *Burgos*, *Logrono*, *Soria*, *Valladolid*, *Segovia* and *Avila*, in Old Castile.

Those of *Huesca*, *Teruel*, *Calatayud* and *Saragossa*, in Arragon.

Those of *Gerona*, *Barcelona*, *Tarragona* and *Lerida*, in Catalonia.

Those of *Caceres* and *Badajos*, in Estremadura.

Those of *Madrid*, *Guadalaxara*, *Cuenca* and *Toledo*, in New Castile.

That of *Ciudad-Real*, in La Mancha.

Those of *Alicante*, *Sin Felipe*, *Valencia* and *Castellon de la Plana*, in the kingdom of Valencia.

Those of *Huelva*, *Seville*, *Cadiz*, *Jaen*, *Cordova*, *Granada*, *Malaga* and *Almeria*, in Andalusia.

Those of *Murcia* and *Chinchilla*, in the kingdom of Murcia.

That of *Palma*, in the Balears.

These divisions were abolished when the king obtained despotic power.

^f The concentration of authority and influence in the capital. It is well known, from repeated experience, that a revolution in Paris is decisive as to the whole kingdom.—P.

provinces. The country is mountainous, but intersected with rich and fruitful vallies, and crossed in different directions with excellent roads, an advantage which few Spanish provinces possess. The climate although cold and variable, is by no means unwholesome; the inhabitants are laborious and poor. That petty kingdom, of which an ancestor of Henry the Fourth^a had been deprived by pope Julius the Second, was united to the crown of Arragon and Castile in the year 1518.^b The traveller who enters the country from France, observes as soon as he has crossed the Pyrenees, the small plain of Roncesvallos,^c and in the convent of the same town, are still seen several relics, that may remind him of the brave Roland and archbishop Turpin.

Pampeluna (*Pamplona*) rises on Mount St. Christopher, above the banks of the Arga, at no great distance from the last mentioned place. It has been affirmed that the town was built by Pompey, who gave it the name of *Pompeiopolis*; at all events, it is the capital of the province, and the seat of a bishopric. The walls, bastions and ancient castle are imposing, but the interior of the town is by no means cheerful; the streets are straight, spacious and deserted, the houses are lofty and built of stone; the trade of the inhabitants^d consists chiefly in coarse cloths and different sorts of earthen ware. Tudela, a handsome episcopal town, possessing manufactories of cloth, soap and pottery, and carrying on a considerable trade in cattle, stands at the confluence of the Queila and the Ebro.

The three Vasconian provinces,^e which derive their name from their ancient Basque population,^f form a triangle of which the northern side is watered by the gulf of Gascony,^g and the two others bounded by Navarre and Old Castile. Distinguished by that great activity and love of independence common to the people in other mountainous countries, these industrious Basques have found in an unfruitful soil, the palladium of their freedom. Although subject to the Spanish domination in virtue of ancient treaties, the kings of Spain may rather be considered their protectors than their sovereigns. The three provinces have a separate government and general assemblies in which their mutual interests are not only discussed, but the orders of the king examined, for they cannot be executed without that formality. They tax themselves to defray the expenses of the local administration; the contributions, which they pay to the crown, are considered gifts that are rarely sought, and never granted, unless they be very moderate.

The Bidassoa, a small river, which discharges itself into the bay of Biscay, separates France from the province of Guipuscoa.^h Fontarabia or Fuentarabia, according to its Latin name, *Fons rapidus*, is a strong place at the mouth of the Bidassoa. Tolosa, the ancient *Iturissa*, is a small but pleasant town on the banks of the Orio. Saint Sebastian is the capital of the province; situated on a peninsula watered by the bay of Biscay, with a small harbour at the mouth of the Urumea, the town itself cannot be considered very large,

^a Jean d'Albret (John III. of Navarre,) great grandfather of Henry IV. by the mother's side.—P.

^b In 1510, Pope Julius II. excommunicated Jean d'Albret, and authorized Ferdinand to take possession of his territories. The latter invaded Navarre in 1511, and July 25th 1512, that petty kingdom was united to the crown of Castile. (Abrégé Chronol. de l'Hist. d'Espagne et de Portugal, T. II. p. 60—65.)—P.

^c Fr. *Roncesvaux*.—Roncesvalles.

^d Its manufactures. ^e Guipuscoa, Biscay and Alava.

^f M. William Von Humboldt has proved by his learned researches, that the Basque bears more characters of a primitive language than any other known tongue in Europe. The name of the people who speak it, appears to be derived from the Basque word *vaso*, which sig-

nifies a mountain. If the same word be used adjectively, the termination *co* must be added; thus the people have been denominated *Vasoco*, and by contraction *Vasco*, a term analogous to mountaineers. The Romans called the Basques, *Vascones*, and their country *Vasconia*, of which the etymology is still preserved in the Spanish word *Vascongadas*.

But the inhabitants are industrious; they carry on a considerable trade, and have manufactories of leather, arms and iron. A large bay apparently closed on all sides by mountains runs into the land between Fontarabia and Saint Sebastian; it forms the harbour of Los Passages,ⁱ one of the finest and safest in Europe. The town is built on a narrow piece of ground between the mountains and the bay. Bergara^k possesses a patriotic school, in which the physical sciences are taught, and where the young nobles of the country are educated at the expense of the state. All the coasts are peopled by fishermen or mariners, and the rural districts by laborious and peaceful husbandmen.

No country can be more agreeable than the hills in Biscay, none more fruitful than the cultivated vallies. Bilbao,^l the capital, has long been the mart for all the wool that Spain exports, and for all the merchandise sent from different countries into the northern provinces of the kingdom. Crowds frequent the harbour, and many ships repair to it, although the town is about two leagues from the sea; it is situated on the right bank of the Ausa, a small river sufficiently deep to receive large merchant vessels; the same river abounds in *angulas*,^m a very delicate fish, highly valued in Spain. The road that leads from Biscay into the province of Alava, traverses the great defile and the mountain of Salinas. Beyond the town of the same name, the heights become gradually lower until they terminate in the fruitful plain of Vittoria, in which many hamlets and villages vary the romantic scenery. Vittoria, the capital, according to its Latin name, *Victoria*, serves still to mark the place where the Cantabri were defeated in the reign of Augustus. It was rebuilt by Sancho the Great, who gained under its walls a decisive victory over the Saracens. The old town consists of irregular and clumsy houses, but the new has been built with much elegance; it contains a spacious square at present set apart for bull fights. Several festivals are held in Vittoria, some in honour of the young, others of married persons; these ceremonies tend to preserve the purity of the people.

The principality of the Asturias is bounded on the north by the ocean, on the east by Biscay, on the south by the ridge of the Asturian Pyrenees, and on the west by Galicia. It is intersected by many narrow and sinuous vallies, which are watered by torrents and rivers well supplied with fish. The people in the province boast that they have never mixed with foreigners; they are brave, patient and laborious. Oviedo, the capital, the ancient *Ovetum*, is situated in about the centre of the province, on a hill that rises in the midst of an undulating plain between the Nora and the Nalon. The cathedral, a Gothic edifice and the finest in the town, was built in the eleventh century;ⁿ some ancient relics have been deposited in it, and the people hold them in great veneration. Cangas de Onis, a small town on the banks of the Cella, stands at a short distance from the abbey of Our Lady of Cavadonga, which, it is said, occupies the site where Pe-

nifies a mountain. If the same word be used adjectively, the termination *co* must be added; thus the people have been denominated *Vasoco*, and by contraction *Vasco*, a term analogous to mountaineers. The Romans called the Basques, *Vascones*, and their country *Vasconia*, of which the etymology is still preserved in the Spanish word *Vascongadas*.

ragius first planted the standard of independence. The same distinguished person resided long at Gijon, a well-built town at the base of a mountain that terminates in Cape Peñas; its port was formerly much frequented. Aviles stands at the bottom of a gulf, on the other side of the cape; it carries on a trade in coal, and in copper utensils manufactured in the neighbourhood.

The kingdom of Galicia, contiguous to the Asturias and to Leon, is bounded on the north and the west by the ocean, and on the south by Portugal. The large vallies in the province are formed by different high chains connected with the Pyrenean range. Some important towns and more than forty harbours^a are situated in Galicia. Santiago or St. Jago de Compostella, although it may not perhaps be the ancient *Gallacia*,^b is considered the capital of the kingdom. The streets are crooked and ill paved; the principal ornament of the town is the large Gothic cathedral, which was built more than a thousand years ago. It is a double edifice, the lower part of which forms a subterranean church consecrated to *San Jago Menor* or St. James the Less, while in the upper church the pious catholics adore the body of *San Jago Mayor* or St. James the Elder, which was discovered at the time the workmen were building the cathedral. The riches of the same church or the treasures supplied by credulous piety have been greatly exaggerated, probably because they were never generally known until an equal division was made between the chapter and Marshal Ney in 1809; the sum allotted to him for the pay of his troops amounted only to a hundred thousand crowns.^c The gold statue of St. James turned out to be only gilt, and his diamond eyes, it was discovered, were *imitation diamonds*. The magnificence of the church consists principally in the extravagance of the sculpture, and in the beauty of the painted windows. The trade in images, chaplets and other objects of superstition is not without importance at Santiago, but the real industry of the place is centred in the cloth and silk^d manufactories. Orense, situated in a fine country near the southern extremity of the province, and watered by the Minho, was formerly more flourishing; a fine bridge of ten arches so lofty that a ship of war with all its masts may sail under them, has been built over the river; one edifice, the Gothic cathedral, may be also remarked for the elegance and regularity of its proportions. Many still resort to the three warm springs, on account of which the town was called *Aque Calide* by the ancients. Lugo, founded by the Romans seventy-six years before the vulgar era, was named *Lucus Augusti* in honor of Augustus. The Tamboga waters the town; the thermal springs and a sacred wood induced the Romans to build it on its present site, where several ruins not uninteresting to antiquaries are still to be seen within the walls and in the neighbourhood. The townhouse and its majestic front were built by the ancients. The circular walls that encompass Lugo, might contain ten times the number of inhabitants; they are nearly a league^e in circumference. Mondonedo,^f situated at the foot of the Sierra de Iufestia of which the declivities descend to the ocean, is the ancient *Britonia*; it was long well known for its cattle-fairs, but at present they are not much frequented.

^a "On the coast are forty sea-ports, but the greater part are very small."—Ed. Encyc.

^b "Perhaps the ancient *Gallacia*" (*Callacia*.) The *Brigantium* of the ancients (Ed. Encyc.) Betanzos, near the bay of Corunna, is the *Brigantium* (*Flavium Brigantium*, Encyc. Method.) of the ancients.—P.

^c Bory de St. Vincent, Guide du Voyageur en Espagne.

The principal ports in Galicia may now be mentioned. Ferrol, the chief town of one of the three maritime departments in Spain, possesses a naval academy and school; its spacious harbour forms a bay, on which formidable batteries have been erected to guard the narrow entrance. The inhabitants are industrious and consequently wealthy. Betanzos, the ancient *Brigantium*, situated at some distance to the south of Ferrol, unites a trade in light wines with the commerce of its port. Corunna,^g the *Caronium* of the Gallæci, situated about five leagues from Betanzos, is divided into two towns; the old town stands at the extremity of a small peninsula, and is surrounded with fortifications; the new town, or the Pescadaria, as it has been called from its fish market, is only fortified on the side of the land. The bay of Corunna is about a league in breadth; the harbour, which is large and commodious, is in the form of a crescent; it is defended by the fort St. Anthony, and is one of the most frequented of any in Galicia. The town is enriched by its commerce and its sardel fisheries, by its cloth, hats and cordage, and lastly by its cigar manufactories in which more than five hundred women are employed. It is not improbable that the word Corunna has been derived from *Columna*; such at least was the name that the ancients gave to a tower that was used as a pharos, in height and appearance not unlike a column. The same tower still remains; according to tradition it was built and consecrated to Hercules by the Phœnicians, and at a later period repaired by the Romans who dedicated it to Mars. A Latin inscription serves to confirm the tradition, but a learned Spaniard^h considers it the work of Trajan.

The kingdom of Leon, an important Spanish province, still retains its ancient title; contiguous to Portugal and Galicia on the west, it is bounded by Estremadura on the south, by Old Castile on the east, and by the mountains which separate it from the Asturias on the north. The Duero crosses it from east to west.

The province derives its name from the town of Leon, the capital, which was founded by the emperor Galba, on the place where a Roman legion (*legio septima gemina*) was stationed. The cathedral church, the principal ornament of the place, was commenced about the end of the twelfth century, and completed in the fourteenth; remarkable for its elegance and lightness, it has been considered the finest in Spain. The streets are crooked and for the most part very dirty; they are chiefly composed of Gothic and irregular houses: the market-place,ⁱ however, may be considered an exception; it forms a perfect square, and strangers admire it for the regularity of the buildings. The antiquary may still discover inscriptions and other Roman monuments in Astorga, the ancient *Asturica Augusta*; the thick walls of the town, flanked with turrets and bastions, were repaired and extended by the French. Ponferrada is supposed to have been the *Pons Ferratus* of the Romans; it possesses an ancient castle now in ruins, which belonged to the Templars. It stands at the confluence of the Sil and the Baeza, in the middle of a large and fruitful valley enclosed by steep mountains. Zamora was destroyed by the Moors in the eleventh century, and rebuilt by Ferdinand the

Second and Alphonso the Eighth. It rises on the right bank of the Duero; the bridge across the river may be said to be the greatest ornament to the town; the military school has not wholly lost its ancient reputation.^a The pleasant town of Toro, although very insignificant in point of size, contains not less than eighteen parishes and an infirmary.^b The cortes met within its walls in the year 1505, and to that assembly the Spaniards were indebted for the wise and equitable laws that are still called the laws of Toro. Tordesillas, the ancient *Turris Syllæ*, is still commanded by the old castle, where the mother of Charles the Fifth died in the year 1555, but long before that period, she was afflicted with the loss of reason. Carrión de los Condes is celebrated in the Spanish chronicles for the exploits of the Cid, and also for a memorable victory over the Moors. An annual tribute of a hundred virgins, which the Moorish princes exacted from the Spaniards, was abolished after the battle, and a festival still held in the town, serves to commemorate the event. The town contains eight parishes;^c it must be a place of considerable industry, for there are not fewer than six linen manufactories,^d eight leather works, five oil, and as many flour mills. Palencia may be considered an agreeable town, although the houses are of Gothic architecture. In one large and well built square, two of the sides are adorned with piazzas, and the cathedral erected by King Sancho, is not inferior in size to any in Spain. Valladolid possesses an university and an academy of painting;^e the royal castle was the birth-place of Philip the Second and of several other kings; the cathedral and fifteen parish churches are richly endowed; many broad and straight streets, adorned with porticos supported by granite pillars, terminate in a spacious square; but with all these advantages, it has the appearance of a deserted town. The population was formerly equal to a hundred thousand persons; it does not amount at present to twenty-five thousand. The inquisition was long held within the walls of Valladolid, and the proceedings were marked with the cruelty and ferocity, which distinguish it from every other tribunal. The same town stands on the site of the ancient *Pintia*, a place mentioned by Ptolemy, at the confluence of the Esqueva and the Pisuerga. The trade of Valladolid is not great; it consists in ribbons, pottery, perfumery and liqueurs. Salamanca, formerly *Salmantica*, celebrated for an university founded in the year 1239, possesses also twenty-five churches, a cathedral, (a fine monument of the sixteenth century,) and many edifices of every period and every style, on account of which it has been styled the Rome of Spain.^f The principal court,^g as the inhabitants call it, forms a regular square; it is encompassed with a portico consisting of ninety arcades; the houses are constructed on a uniform plan, and surmounted with stone balustrades. The one half of the bridge across the Torines was built by the Romans, the other in the time of Philip the Fourth. Ciudad Rodrigo, an important fortress in the twelfth century, was more than once besieged in the last war. It appears from inscriptions and different remains of antiquity, that it was the *Lancia Transcudana* of the Romans, so called from its position on

the right bank of the Agueda or, according to its ancient name, the *Cuda*

Old Castile is divided into five provinces; it is bounded on the north by the Gulf of Gascony, on the west by the Asturias and the kingdom of Leon, on the south by New Castile, on the east by Arragon, and on the north-east by Navarre and the Biscayan provinces. The Duero waters the country, and flows in the direction from east to west Castile, it has been affirmed, was so called from the great number of castles (*castillos*), formerly its means of defence against the Moors, and the residences of petty princes whom ambition armed against each other.

Santander, supposed to be the *Menosca* of the *Varduli*, is the largest town in the north of Old Castile; many vessels frequent the harbour, and it carries on a considerable trade in wine. Burgos, the *Bravum* of Ptolemy, and an ancient capital, abounds with convents and churches.^h The cathedral, a highly finished Gothic edifice, remarkable for its elegance and the numerous small spires that rise above each other on every side, the remains of the house inhabited by the Cid, the arch of Fernando Gonzalez, the episcopal palace, and St. Mary's arch, which might be more correctly denominated the triumphal gate that leads to the Rio Arlanzon,ⁱ are the principal ornaments or curiosities in Burgos. Beyond the walls are the tomb of the Cid, and the ruins of the palace formerly belonging to King Alphonso the Wise, a legislator and an astronomer, and the author of the *Alphon sine Tables*. Soria, a small town watered by the Duero, stands on the site of the ancient *Numantia*; it possesses a considerable trade in wool.

Segovia requires a more minute description; it is the ancient *Segovia*, a Celtiberian city embellished by Trajan; its name has not been changed. It stands on a hill of which the Eresma waters the base. The Arabic gate and the Alcazar, an old castle flanked with turrets, and built on a precipitous rock, may still give the stranger some notion of the flourishing state of Segovia under the Moorish domination. But these sink into insignificance when compared or rather contrasted with the work of Trajan, the aqueduct with a double row of arches, by which water has been conveyed into the town for seventeen hundred years. It consists of a hundred and nine arches,^k the largest of which are nearly ninety feet in height from the ground to the conduit, and the length of the space which they cover, exceeds 2530 feet. If Trajan raised a structure so costly, solid and gigantic, it may be readily admitted that Segovia, in ancient times, was a much more important place than it is at present. Other works of past days still serve to recal the ancient splendour of the town; but sumptuous temples have given way to time or the more destructive efforts of ignorance and barbarism. The cathedral is the finest modern edifice in the city; it was built in the sixteenth century, and its demi-gothic style announces the period of the regeneration of art. The styles of different periods are united in the Alcazar, and the interior is not the least curious part of the building. The principal stair-case is constructed in the best taste, most of the apartments are adorned with carved and

^h It is situated on the declivity of a hill, on the right bank of the Rio Arlanzon.

ⁱ "The principal approach to the city is by the gate of Santa Maria, which opens on one of the bridges over the Arlanzon."—Ed. Encyc.

^k It contains 159 arches. (Townsend.)—P.

^l A double row of arches, one above another, crosses the valley and the plain of Azoquejo. The greatest height of this part of the aqueduct is eighty feet ten inches. (Ed. Encyc.)—P.

gilt wood-work, and in the largest hall is contained a collection of wooden statues representing the kings of Oviedo, Leon and Castile, from Favila the First who reigned in the eighth century, to queen Joan, surnamed the Foolish,^a the mother of Charles the Fifth. The Cid and his famous horse Babicio are also represented; one may see too the real or supposed saddle of the same courser, which contributed more than once to the victories of its master. The pupils in the royal school of artillery founded by Charles the Third, now met in this ancient edifice. Segovia was formerly well known for its cloth; it possesses still a great many looms, four fulling mills, and three large washing places for wool.

St. Ildefonso lies at two leagues from Segovia. Once a manor belonging to a society of monks, it was purchased by Philip the Fifth, who built a palace on the grounds, to which the king and his successors repaired in summer. The houses near it form a small town of four thousand inhabitants. The palace is of simple architecture, and within it are contained the best paintings which Christina of Sweden collected at Rome. It may be said of the gardens, as it has been said of those at Versailles, that art has conquered nature; the water which descends from the neighbouring heights has been collected at a great expense; a thousand channels supply lakes, cascades, fountains and jets that rise above the trees, and surpass every thing of the kind in Europe; in short, Philip the Fifth imitating the prodigality of his ancestor,^b expended 45,000,000 piastres on his country seat, an enormous sum, by which the treasury was almost exhausted.

Avila is the most southern province in Old Castile; the name of the chief town is the same as that of the province, and is derived from an Arabic word. Avila has a fine cathedral and a college, but on the whole it may be considered a dismal and gloomy city encompassed with thick walls. It was the native town of St. Theresa and of the historian Gilles Gonzalez Davila.

The ancient kingdom of Arragon forms a single province, bounded on the north by France, on the east by Catalonia and the kingdom of Valencia, and on the west by Old Castile. Tarazona, supposed to be the ancient *Augustobriga*, stands at the foot of the Sierra de Moncayo, and is divided into the high and low town. It may be doubted if the convent belonging to the Fathers of Mercy is entitled to the encomiums that have been lavished on its architecture, but the faithful repair to it that they may adore the bodies of St. Boniface and St. Eusebius. Borja, a small place at no great distance from Tarazona, carries on a trade in flints, which abound in its neighbourhood. Calatayud, on the banks of the Xalon, was built on the ruins of *Bibilis*, the birth-place of the poet Martial. Daroca appears to be the ancient *Agiria*, a city of the Celtiberi; a vast cavern in the vicinity, at the foot of the chain of Moncayo, receives the torrents that descend in rainy seasons, and thus secures the town against inundation. Albaracin,^c of which the name is evidently Arabic, is watered by the Guadalaviar; it rises in a fruitful and romantic valley enclosed by the mountains of Ibbeda and the Sierra de Albaracin. Teruel near the confluence of the Guadalaviar and the Rio Alhambra, an

ancient town without any remarkable buildings, is distinguished by the industry of its inhabitants. Alcaniz^d was built by the Moors; its name signifies a *treasury* in the Arabic language; it is commanded by an old fortress near the Guadalupe, and adorned with a very fine square, that leads to the principal church. Barbastro,^e an old town encompassed with walls, stands on the banks of the Vero, a small river that divides it into two parts, which communicate with each other by a stone bridge. The Madragora flows near the little town of Benavarre;^f the same stream issues with a loud noise at irregular intervals from the depths of the earth, and rushing suddenly into the neighbouring vallies, destroys the harvest and the labours of the husbandman. Jaca,^g a strong hold at the base of the Pyrenees, is not more than six leagues from the frontiers of France; it lies in a beautiful valley that communicates with several others of a smaller size. Sos is only remarkable for an old castle in which Ferdinand the Catholic was born. Huesca, the ancient *Osca*, which was raised to the rank of an episcopal town in the sixth century, is pleasantly situated in the midst of a plain, that extends on the north to the Sierra Guara. The streets are well built; the longest or the *Calle del Corso* consists of uniform houses and different public buildings, such as the cathedral, the consistorial chamber, the university founded in the year 1354, the palace of Count Huaza, and the convents of St. Francis and St. Domingo.

Saragossa, the ancient *Salduba*, was erected into a military colony by Augustus under the name of *Cesar Augusta*. The Spaniards call it Zaragoza; situated almost in the centre of Arragon, near the junction of the Ebro with the Huerva, it is the capital of the province, and likely to be for ever memorable in the annals of Spain from the resistance it made against the French troops,^h who took it by assault, and when masters of the walls, were obliged to besiege the houses. The bridge of Saragossa consists of seven arches, one of which is 180 feet wide. The *Holy street*ⁱ is not only longer but broader than any other in the town. The church of Our Lady^k is superior in architectural beauty to the cathedral, and also more celebrated on account of its miracles. The adjoining country has a monotonous appearance in spite of the most varied culture. An edifice in the neighbourhood, the convent of the Hieronymites, erected in the middle ages, exhibits a fine mixture of the Moorish and Italian styles.

Catalonia, contiguous to France, Arragon and the kingdom of Valencia, is bathed on the east by the Mediterranean. A mountainous country and a great extent of coast appear to have had some influence on the character of the inhabitants, or in other words to have rendered them more industrious, more attached to their native land, and consequently more watchful of its independence. The people of *Marca Hispanica*, as the province was then called, shook off the Moorish yoke in the tenth century. *Gotholaunia*, from which the word Catalonia has been derived, was at the same time substituted for its ancient name.^l The counts of Catalonia, originally vassals of France, at length made themselves independent, and the people excited by their warlike spirit, carried their arms or their commerce into most countries then known. Lastly, the house of Catalonia having become

^l "In the tenth century, the province of Catalonia, which had been already freed from the Moors, changed its name of *Marca Hispanica* for that of *Gotholaunia*, from which the present name is derived." Catalonia was conquered by the Saracens in 712, but before the conclusion of the same century (the eighth,) they were completely expelled from the province by Lewis the Debonnaire.—Ed. Encyc.—P

powerful from alliances, was able to unite on a single head all the crowns of Spain. The activity which distinguishes the Catalonian, his patience of labour, his pride that makes him submit to many privations rather than become a servant, or engage in servile employments in his native country, and his language, a Provençal dialect unintelligible to other Spaniards,^a render Catalonia different in many respects from every other province in the kingdom. Agriculture has made greater progress; trees are not proscribed as in some other provinces; the woods and groves near the towns heighten the effect of the scenery, and afford a grateful shade against the heat of the sun, an advantage of which Arragon has been deprived.

Junquera at the base of the Pyrenees, the last Spanish town towards the eastern extremity of those mountains, was called *Juncaria* by the Romans from the great number of rushes^b (*stipa tenacissima*), that grow in the neighbourhood. The industry of the inhabitants is mostly confined to their cork manufactories, from which they derive a considerable profit. Figueras, supposed to possess the strongest citadel in Europe, is regularly built and situated in a fruitful country at the extremity of a range of hills which separates the course of the Muga from that of the Marol. Two roads meet in Figueras, one of which leads to Rosas, a strong place on the coast with a large but not very safe anchorage, and the other to Gerona, which the poet Prudentius, a writer of the fourth century, calls the small and wealthy town of *Gerunda*. Little of its wealth now remains; it stands at the foot of a hill, and is commanded by the small fort of Montjoui; all the other fortifications were destroyed by the French in 1808. The only remarkable monuments are the Arabic baths within the convent of the Capuchins, and the cathedral of which the front cannot be too much commended. There are soap works and one or two cotton manufactories in the town.

Urgel, or as it is called in Spain, *Sco de Urgel*, an episcopal city, well known during the last Spanish revolution as the place where the apostolic junta assembled, rises in a valley near the Pyrenees, on the banks of the Segre. Balaguer and its strong castle are situated below it on the same river; it is the ancient town of *Bergusia*, to which place, according to Livy, the Romans sent ambassadors two centuries before the vulgar era, to persuade the inhabitants to break off their alliance with the Carthaginians. The Segre also waters Lerida, or as Lucan calls it "*Ilerda* on the peaceful streams of the *Sicoris*." Livy calls it by the ancient Greek name of *Athanagia*, which signifies immortal. Lerida rises on the declivity of a hill, and is surrounded by a very fruitful country; the banks of the river are shaded by poplars and other trees. The town still possesses some remains of ancient splendour, among others the gate of *Los Botes*, a Roman building. Cervera, although the largest of the four towns of the same name, is a small place surrounded with walls and defended by an ancient castle. The university may be considered the finest edifice; it was founded in the year 1717. Igualada on the banks of the

Rio Noya, is well built; the inhabitants are frugal and industrious.^c

Montserrat rises at the distance of five leagues from the last mentioned place; its numerous peaks tower into the air, and from their appearance its name has been derived, which signifies the *serrated mountain*. The caverns in its schistous and calcareous mass are remarkable for the yellow alabaster deposited within them in the form of stalactites. The mountain is about eight leagues in circumference, and its summit is almost always concealed by clouds. Fourteen hermitages are situated between the base and the top; the magnificent convent of the Benedictines is about half way from the summit. It was there that Ignatius Loyala, anticipating the great events to which he believed himself called, consecrated his sword to the virgin. The Cardenet^d which throws itself into the Llobregat, flows at no great distance from Montserrat; a canal serves as a communication between the two rivers, and runs through the town of Manresa, the inhabitants of which carry on a trade in silks and gun-powder. A very magnificent church may be seen on the left bank of the Cardenet; it was built by the Jesuits above a grotto, to which the founder of their order retired, when he composed his *Spiritual Exercises*.

The small town of Cardona, at some leagues to the north of Manresa, is supposed to have been the ancient *Udura*; at present it is only remarkable for the rock-salt mines in the vicinity, but it is difficult to conceive a more splendid spectacle than these large open quarries exhibiting saline deposits nearly four hundred feet in height,^e and which when illumined with the sun's rays, display the brilliant colours of the rainbow. The strata of rock salt are in some places as transparent as crystal; in others they are blue or bright red or mixed with greyish clay. The variety of vivid colours gives to the abrupt sides, the prominences and the summits of this imposing mass, the only one of the kind in Europe, the appearance of a mountain of precious stones, surpassing in magnificence whatever has been imagined by the natives of the east concerning the abodes of fairies and genii. The geological position of these salt mines was long unknown to naturalists; but it has now been ascertained that the vast prominence which they form, in the midst of a space nearly twelve thousand feet in length, and four thousand in breadth,^f contains deposits of gypsum and clay arranged in vertical strata, and separating in some places the layers of salt. These substances, together with the sandstone, the quartz and the limestone of the surrounding mountains, may be considered as belonging to the intermediate formation.^{g h}

A road from Cardona passes between frightful precipices and through a thick wood at the end of which may be seen the romantic town of Solsona,ⁱ the *Setelsis* of Ptolemy. It rises near the extremity of a group of mountains, on the banks of the Rio Negro. The neighbouring districts are well cultivated, and the inhabitants of the town manufacture cutlery and hardware. A chain of mountains connected with the Pyrenean range, and separating the course of the Llo-

^g "—to the formation of middle sediment (*sedimens moyens*)"—secondary formation. M. Cordier considers the salt and gypsum as tran-

sition, and the rocks in the surrounding mountains as secondary. The salt hill occupies the centre of a circus having the shape of a horse shoe, and surrounded by mountains on every side, except towards the east, where it opens on the valley of the Cardonero. See an abstract of M. Cordier's memoir in De la Beche's *Selections of Geological Memoirs*, p. 52.—P.

^h See the memoir on the rock salt of Cardona, by M. Cordier. (*Journal de Physique*, tome 82.)

ⁱ Salsona.

bregat from that of the Ter, extends between Solsona and Vich,^a the latter an ancient town built on the ruins of *Ausa*, the inhabitants of which resisted the Romans a hundred and eighty-five years before the vulgar era. The streets are broad, some however are not paved, and most of them are very steep. The principal square is surrounded with arcades, and the shops, coffee-houses, and other places of amusement render it a place of resort for the town's people. The fertility of its environs, the copper and coal mines in the neighbouring mountains, and the linen and cotton manufactures within the walls, maintain the commerce of the inhabitants.

As to the towns on the coast of Catalonia, Mataro, or as Pliny calls it *Illuro*, is the capital of a maritime department. It carries on a considerable coasting trade, and many vessels repair to the harbour; the inhabitants manufacture a great quantity of lace, and the products of the distilleries are held in some repute. The old town stands on an eminence; ancient walls, gates and other remains of antiquity still remain; the streets are narrow, but not so crooked as those in many other Spanish cities. The new town, formerly a suburb, is now much larger than the old; it is better planned and better built; the houses are not inelegant, and many of them are adorned with fresco paintings.

Whether the stranger travels along the road that leads from Mataro to Barcelona, or proceeds to the same capital by sea, he is struck with the beauty of its position, the regularity of the buildings, and the impulse given to commerce by the activity of the population. There are not fewer than seven hospitals, four public libraries, eight public schools,^b a seminary, an institution for the deaf and dumb, an academy of painting, schools of pharmacy, surgery and medicine, and lastly, a society for the encouragement of arts and sciences.^c The buildings set apart for these different institutions are not unworthy the large city of Barcelona; but the finest edifices are those reserved for public or religious purposes: among the former are the palace of audience,^d in which the celebrated archives of Arragon, and other documents connected with that kingdom, as old as the eighth century, are deposited; the town-house, an elegant building; the palace of the captain-general of the customs, the front of which is adorned with two rows of columns; the *lonja* or exchange, admirable for the simplicity of its architecture; and lastly, the theatre, perhaps the finest of the kind in Spain. The convent of Santa Clara is all that remains of the ancient palace that belonged to the counts of Barcelona, and the kings of Arragon.^e The cloister in the convent of Mercy is very large and of finished workmanship. The church of St. Michael, once the temple of Neptune, is still adorned with an ancient Mosaic pavement. The cathedral is a Gothic building, but bold, simple and majestic; an alabaster mausoleum, containing the remains of St. Eulalia, the tutelar saint of the city, may be seen in a chapel under the church. The church of St. Mary of the Sea is after the cathedral, the finest in Barcelona. It is not difficult to trace the successive additions made to the town; the old streets are narrow and crooked, but the new are straight;

^e The palace of the Counts of Barcelona and the Kings of Arragon

the modern houses consist of four or five stories; they are adorned with balconies, and are mostly constructed with considerable taste. Many Roman monuments are still to be found in Barcelona; the ancient city was called *Barcino*, and it has been supposed, was founded by Hamilcar, the ancestor of Hannibal. The fort of Monjuich or Montjoui, which guards the town on the south, while the citadel defends it on the north, stands on the site of a temple dedicated to Jupiter. The new town of Barcelonetta has been built near the mole that extends into the sea; it forms merely a suburb of Barcelona. The port, although regularly cleaned, is much encumbered with ooze and pebbles; it has been for a long time inaccessible to large ships, an inconvenience which has hitherto had little effect on the commerce of the place; the products of its industry consist in cloths, velvets, silks, lace and excellent armour.^g The consequences of the epidemical disease by which the population was more than decimated in 1821, are now almost forgotten.

It would be an omission to say nothing of the situation of Barcelona, or the varied scenery in the neighbourhood, forming a landscape of lofty hills, thick woods, precipices, torrents and foaming cataracts, worthy to be appreciated by those who can find subjects of study in the beauties of nature.

Many monuments of Roman power are seen in the country between the capital of Catalonia and Tarragona; the remains of an aqueduct near Villa Franca form a communication between two steep mountains; the ruins of an ancient fortress are situated near Villa Nova,^h and numerous sepulchres dug in rocks, exhibiting, if it may be so said, the impressions of so many human bodies, indicate the site of *Carthago Vetus*, a town mentioned by Ptolemy; a triumphal arch rises beyond the burgh of Vendrell, and near Torre-dam-Barra, a majestic tomb, which according to popular tradition contains the ashes of the Scipios. From the last mentioned place may be seen Tarragona apparently extending into the sea, and which different antiquarians consider *Tarraco*, a place that in the time of the Romans gave its name to the largest province in ancient Hispania. The town stands on an eminence six hundred feet above the level of the sea; it is defended by walls flanked with bastions, and within their enclosure are many ancient monuments together with some fine modern buildings. The Roman aqueduct is still kept in good repair; uniting utility with its historical recollections, it furnishes wholesome and limpid water to the whole population. The cathedral, of which the architecture appears to have been borrowed from the Moors, is certainly the largest building in the town. Tarragona was exposed to many disasters in consequence of its resistance to the French armies, but it has now become more industrious and more flourishing than formerly. The harbour begun in 1800, affords at present an easy entrance to ships, and a safe retreat against every storm. The wool, the fisheries, and the coasting trade of Tarragona, together with the commercial relations between the same place and distant countries are the guarantees of its prosperity. The

town was the birth-place of Paul Orosius, a disciple of St. Augustine.

Reuss,^a a place founded by the clergy of Tarragona,^b was only a burgh at the end of the last century, but its commerce and industry now place it among the number of important towns. It carries on a trade in glass, and it possesses a hundred and fifty tan-pits, a hundred and twenty machines for carding cotton, eighty-four for spinning silk,^c six bleach-fields, as many hat manufactories, fifteen soap works, and twenty for different sorts of dyeing.

Tortosa, the ancient *Dertosa*, formerly one of the largest cities in Tarraconensis, stands near the southern extremity of the province, between two chains of mountains on the banks of the Ebro. The Spaniards having taken it from the Moors in the year 1149, the latter collected a great force, and laid siege to the town; the besieged exhausted by a long resistance, were about to give up the place for want of hands to defend it, when the women took up arms, and drove away the Mussulmans. A military ceremony in which the women took precedence of the men, served until lately to perpetuate the memory of the event. Tortosa is at present reckoned one of the strong places in Spain, and it is also the capital of a maritime department. The finest edifices in the town are the cathedral and the episcopal palace.

The kingdom of Valencia forms a province bounded by Catalonia, Arragon, New Castile and Murcia. The coasts are more extensive than those of Catalonia; the land yields rich harvests, and abounds in mines and different sorts of marble.

The Valencian is not only laborious and industrious, but he possesses a lively imagination, and his uniform gayety or cheerfulness cannot be wholly subdued by misfortunes. They unite, says Fischer,^d the opposite qualities that are remarked in the inhabitants of the north and in those of the south, the bodily strength of the Norwegian with the impetuosity of the Provençal. They are fond of religious ceremonies, festivals, amusements and every sort of bodily exercise. It is inspiring to see the ardour with which they dance to the accompaniment of the tambourine and the *dulzayna*, an Arabic instrument, not unlike the clarinet, used at present in no other Spanish province. Their dialect, derived from the Provençal, although soft and agreeable, particularly in the mouths of the women, is not destitute of energy. The *Fiera*, a very ancient ballad, which the peasant sings to the sound of his guitar, expresses the woes of love in harmonious modulations and in the continued accord of the accompaniment. A fondness for finery or display in dress is common to every class of people in Valencia. The bonnets of the peasantry are like those used by the ancient Phrygians; their shirts are bound by a girdle, and descend in the form of a tunic;^e sandals attached with cords are worn instead of shoes; lastly, a large piece of cloth falls over the shoulders, and completes the costume. On festival and gala days they appear in velvet, a broad hat encircled with ribbons protects them from the sun, while their mantles and buskins are adorned with strings^f of gold or silk. The country women are distinguished by their

grace and gayety from the inhabitants of the other provinces; they never appear without their veils, and wear even during festivals the same sort of bodice that was worn by their ancestors.

The road from Tortosa leads to Peñíscola, a frontier town in Valencia; it stands on a rock that rises from the sea to the height of 240 feet, and a belt of sand, only thirty feet wide in its narrowest part, unites it with the continent; but the same belt was sometimes covered with water in tempestuous weather, before a dike was raised by the inhabitants. The town thus fortified by its position was considered impregnable until Marshal Suchet took possession of it in November 1811. The ruins of a church belonging to the Templars may still be seen; it was to it that the antipope Peter Luna,^g who had taken the title of Benedict the Thirteenth, fled for safety; he died in the same place in the year 1423. A natural grotto into which the waves are precipitated with a loud noise, has been called the *Bufador of pope Luna* in honor of the same celebrated person.^h Castellon, surnamed *de la Plana*, to distinguish it from two other cities of the same name, the one in Valencia, the other in Catalonia, is a well built town about a league from the sea, and at a short distance from the Rio Mijares, over which a bridge of thirteen arches has been lately erected. Francisco Ribalta, the celebrated painter, was a native of the town. Segorbeⁱ has been considered the *Segobriga* mentioned by Pliny; but the dolphins represented on the medals of the same place seem to indicate that the ancient town of the Suesetani was not far from the sea.^k

Valencia, which gives its name to the province, is one of the finest and largest cities in Spain. The Spaniards still call it by the ancient name of *Valentia*,^l but the antiquities consist merely of imperfect inscriptions and mutilated columns. The Guadalaviar passes through the town; although at no great distance from its mouth, it is very narrow, because the streams are diverted and serve to irrigate the fertile districts watered by the river. Bridges^m lead from the town to the different suburbs. The cathedral, an ancient mosque, may be remarked on account of a silver altar,ⁿ and the pictures that adorn the chapels. The Arabic baths, although disfigured by modern additions, enable us to judge of the manner in which the Moors laid out these edifices. The custom-house, a fine building, forms nearly a side of the square of St. Domingo. The *lonja* or exchange, a Gothic edifice in the market-place, is crowned by a range of battlements rising above a hall 120 feet long, eighty broad and sixty in height. The elegance of the private houses, at the same time that it announces the wealth, is creditable to the taste of the inhabitants. The same town was the first in Spain, in which *serenos* were established, or companies of police that walk the streets at night, watch over the public safety, and warn the inhabitants in cases of fire. These useful institutions have been adopted in all the large Spanish towns since the last century. Lastly, it was also the first place that participated in the benefits of printing; so early as the year 1474, the inhabitants distinguished themselves in the new art, and even at present it possesses a decided

^m "Five bridges."

ⁿ "The great altar."

superiority in this respect over all the other towns in the kingdom. The same cause may account in some measure for the rank which it holds among the cities that have produced celebrated men in literature and the arts. The institutions connected with education or instruction are seven seminaries,^a an university, two public libraries, a botanical garden, a great many elementary schools, a military school for cavalry, a royal academy of liberal arts, and a society of agriculture and rural economy.^b

Whether a stranger leaves Valencia by the gate of Serranos, of which the semi-gothic architecture and the two massive octagonal towers accord perfectly with the battlemented walls that surround the town, or proceeds by the triumphal gate, called the *Puerta del Real*, along the fine walk of the *Alameda*, he is equally struck with the beauty of the country, the richness of the cultivation, and the luxuriance of the vegetation throughout the whole extent that the eye can reach.

Two places may be mentioned between Valencia and Alicante, namely, Gandia, a small maritime town, situated in the most fruitful and finest part of the province, and Denia, a port now insignificant, but celebrated in ancient times under the name of *Dianium*,^c from a temple consecrated to Diana, of which some remains may be observed. Alicante^d still retains an Arabic name; it is built near the site of the ancient *Lucentum*, and extends along a fine beach under several hills. A castle commands the nearest of these heights, the rocks of which threaten to give way and to destroy the town. The harbour is safe and commodious, and the large and deep bay might serve as an anchoring place for several fleets. Orihuela near the confines of Murcia, occupies the site of the ancient *Orcelis*, a town supposed to have been founded by the Carthaginians; it stands in a fruitful plain watered by the Segura, and at the base of a lofty calcareous hill. Xicoua,^e a place of some trade,^f is about twelve leagues to the north-east of Orihuela. Lastly, San Felipe, formerly Xativa, which was destroyed because the inhabitants resisted Philip the Fifth, and afterwards restored by the same prince, who gave it the name that it now bears, is situated at the foot of a mountain, on which may be seen an ancient castle, built first by the Romans, and afterwards by the Goths and Moors. San Felipe possesses a considerable trade in cotton and silk manufactures, and according to tradition, it occupies the site of *Satabis*, famous in ancient times for its linen.

New Castile forms a large division of Spain, bounded by the kingdom of Valencia, Arragon, Old Castile, Estremadura, Andalusia and Murcia; it comprehends the provinces of Cuenca, Guadalaxara, Madrid, Toledo and La Mancha.

Few towns of any consequence are situated in the province of Cuenca.^g San Clemente in the south, is one of the largest; it possesses a Latin seminary. Huete,^h a small and finely situated town in the north, bears the name of the stream that waters it. Cuenca in the centre, the ancient *Valeria*, near the confluence of the Huecar and the Jucar, rises on a mountain of which the sides form lofty precipices above these rivers. It contains fourteen churches, two hos-

pitals and three seminaries,ⁱ but it was formerly more populous than at present. It is the native town of the architect Herrera,^k and of the celebrated jesuit Lewis Molina, one of the most subtle casuists of his fraternity.

Siguenza in the province of Guadalaxara contains nothing remarkable except a Gothic cathedral, three hundred and thirteen feet long, a hundred and twelve broad, and as many in height. It was in ancient times the Celtiberian town of *Seguntia*. Guadalaxara or Guadalajara, although the capital, is an old Moorish town, ill built and enclosed with walls, on the eastern bank of the Rio Henares. It still possesses some of the cloth manufactories in which its riches formerly consisted; the largest of these manufactories belongs to the king, but their products are not in so great repute as they once were.

Madrid, the capital of the kingdom, adds considerably to the importance of the province, in which it is situated. The town, it is said, was built near the site of *Mantua*,^l a city belonging to the Carpetani. While the Goths were masters of the country, it was a mere village under the archbishops of Toledo. It was included in the number of royal towns in the fourteenth century, and obtained the title of capital by a decree of Philip the Second. It is higher than any other metropolis in Europe, being 1800 feet^m above the level of the sea, a circumstance that partly accounts for the comparative coldness of the temperature. The climate has some resemblance to that in the north; in summer the heat is oppressive, the centigrade thermometer reaches often to forty degrees; in winter, the cold is keen and piercing, and the mercury in the same thermometer descends sometimes so low as eight or ten degrees below the freezing point. The houses are ill adapted to shelter the inhabitants against the cold or the humidity of the north wind, for they consist mostly of high apartments, in many places not air-tight, and seldom provided with a fire or chimney. The word Madrid is of Arabic origin, and signifies a *well-aired house*,ⁿ but the variableness of the climate gives rise to phthisis, putrid fevers and a sort of dangerous colic, which, according to many, can only be successfully treated by the physicians of the country.^o It still contains some old houses built of wood, and decorated according to the ancient custom with paintings representing bull-fights and persons in the costume of the sixteenth century; but the modern quarters of the town are provided with brick or stone houses and broad streets, not inferior to any in other European capitals. The street of Alcalá is the largest in Madrid, and the most remarkable for the number of public buildings; ten carriages may pass abreast in any part of it. Of the forty-two squares, it is only necessary to mention the square of the Royal Palace, adorned by that large and imposing edifice; the square of the sun,^p where five of the principal streets terminate, and a place of resort both for the idle and the busy; and lastly, the great square (*Plaza Mayor*) in the centre of the town, formerly frequented on account of the bull-fights and the public festivals at which the king assisted from the balcony of a small palace that has been since converted into a hall for the royal academy of history. The Cevada is the place

to which the people run with the greatest pleasure, because it is there that criminals are executed, but the most delightful to a real Spaniard, is the one that serves as an arena for bull-fights.

Whoever has not been a witness of these spectacles, where the blood of man is mingled with the blood of an infuriated beast, can form but an imperfect idea of them. It is still more difficult to conceive the ardour with which the people, as well as men and women of the highest rank, rush into the enclosure prepared for these dangerous combats. The artisan, insensible to the wants of his family, leaves his work, and carries his furniture or best clothes to a mount of piety, that he may procure a sufficient sum to pay for his place at the *corrida*.^a A surgeon and a priest may be seen in attendance near the amphitheatre, apparently very indifferent about the passing scene, until it has been announced to them that the *torador* is mortally wounded, when the one administers the resources of his art, and the other the consolations of religion. A combat that is exhibited gratuitously to the people, serves as a prelude to the one for which the spectators pay. The first rays of the sun have hardly illumined the horizon, when the people appear in crowds at the entrance of the circus, to see the bull let loose into the arena, where tormented by a multitude who have passed the night in taverns, in order to get a good place at the combat, it often wounds the fool-hardy drunkards that venture to attack it, until the *matador* dispatches it, and puts an end to the fight. In the mean time, preparations are made for the principal spectacle; the first places are filled with the ladies and gentlemen of Madrid, and the others with the lower orders, who can afford to pay for their amusement. The box of the king is situated opposite the gate by which the bull is driven into the arena, and another in front of the king's belongs to the municipal authorities. Before the combat commences, an officer bows to the king or to the place reserved for him, and then receives his instructions from the master of the ceremonies. The latter gives the signal by throwing up a number of keys.^b The silent crowd eagerly await the long wished moment. The *picadores* (prickers), clad in silk jackets, bespangled with gold, and adorned with ribbons of every colour, and chamois pantaloons lined with iron from the heel to the haunch, armed with long and light spears, and mounted on horses with fillets bound round their eyes, march in file to the accompaniment of trumpets before the two principal boxes, and range themselves opposite the gates. The *chulos* or tormentors in the costume of Figaro, carrying long scarlet scarfs, pass between the posts of the balustrade, which separates the arena from the spectators. The *chulos* are replaced by the *matadores*, holding a long sword in one hand, and the *muleta* in the other, a sort of small banner that they use as a buckler. After having been presented by a municipal officer to the prince and the master of the ceremonies, they retire in the same order that they entered.

A flourish of trumpets precedes the commencement of the combat. The gates open, and the *picadores* with couched lances prepare for the fight. The animal springs into the enclosure, runs round every part of it, and seeks in vain to escape. The appearance of twelve or fifteen thousand persons waving their handkerchiefs and their hats, and the shouts of joy that accompany its entrance, frighten or enrage it. It strikes the earth with its horns, beats its tail against

its sides, and attacks one of the *picadores*, who receives it with his lance, supporting it with all his strength against the shoulder of the animal; but as the iron point at the end of the lance can only gall the bull, it becomes more furious, and rushes successively against each of the *picadores*. If the men are not very dexterous, or if their lances break, they are dismounted, and their gored horses fall dead on the arena. The horsemen themselves, although their limbs are covered with plates of iron, might also be destroyed, if the *chulos* did not run forward and turn away the animal by waving their silken banners. When a sufficient number of horses have been killed, the *picadores* retire and give place to the *chulos*, to whom the perilous task is committed of plunging the *banderilla* into the body of the animal, at the junction of the neck and shoulders. The *banderilla* is a small staff about two feet long, furnished at one extremity with a bent spike, and at the other are attached many squibs and crackers.^d The light *banderillero* places himself in front of the animal, passes his arm between the horns, and fixes the *banderilla*, but if he miss his mark, he is infallibly wounded or tossed into the air by his furious adversary, while shouts of *viva* are a thousand times repeated by the crowd. Tormented by the iron and the fire, the bull bellows, bounds, turns and fights with desperate fury, when a flourish of trumpets announces its approaching fate. Assisted by four *chulos*, the *matador* holding in one hand a drawn sword, and in the other an unfurled *muleta*, presents himself with great gravity. The flag which he displays attracts the attention of the animal; the two adversaries look at each other an instant, the one to satisfy its fury, the other to ward off its attacks. The spectators are all attention; the bull springs forward, but only tearing the light silk, passes under the left arm of the *matador*, who with his right hand strikes the sword into its withers, and separating two vertebræ, dispatches his victim at a single blow. The victor is then hailed with the applauses of the whole assembly, and if he has the address not to leave hold of his sword until he presents it to the people, the ladies crown him with flowers, and the gentlemen load him with piastres. But if the *matador* strikes the animal in any other place than that prescribed by the rules of art, so that it does not die instantly on the spot, hisses and groans are his only reward. If the bull kills one *matador*, the people continue shouting *bravo*, until it falls by the hand of another. These sanguinary spectacles, not unknown in the most remote antiquity, and common in the days of chivalry, have retained something of the barbarous gallantry of the middle ages; the *matador* presents with much grace to his mistress or to a noble dame in the assembly, the ribbons placed on the back of the animal to indicate the colour of its breed. These representations, however solemnly conducted, impress the stranger with no favourable idea of Spanish civilization; for the people are not satisfied until ten or twelve bulls and about twenty horses have fallen; indeed, as a writer who resided long in Spain, and was frequently a witness of these spectacles, affirms, the combat can hardly be considered complete unless a *matador* has lost his life. But these accidents do not happen so often as might be expected, fortunately for those not familiar with such scenes, or who do not think the death of a man a very agreeable spectacle.

Madrid was bombarded in 1808 by Napoleon, who adopted that method of compelling the people to acknowl-

^a *Corrida de toros*, bull-fight.

^b —“by throwing to the officer the keys of the gates by which the bulls are let into the arena.”

edge the title of king of Spain and the Indies, which he had conferred on his brother. The same brother of the emperor adorned and improved the capital of Spain. It was he who levelled with the ground the old houses in the neighbourhood of the new palace, and rendered the edifice worthy of being ranked among the finest royal residences in Europe. The interior is decorated with valuable paintings, and the twelve mirrors in the king's hall^a are said to be the largest on the continent. The royal arsenal rises near the principal front of the palace, and an elegant arcade extends along its eastern extremity. This building contains a rich collection of ancient armour, among which that of queen Isabella is still preserved; but M. Reichard, who mentions among its curiosities the sword of Francis the First,^b has forgotten that it was the only trophy retained by Napoleon, of all the victories which he gained in Spain. The royal library, valuable from its manuscripts, medals and antiquities, contains 150,000 volumes. The royal museum of natural history, and the royal academy of San Fernando, founded by Philip the Fifth, are situated in the street of Alcala. M. Mariano de Cabrerizo, a Spanish writer, has added the authority of his name to a popular fiction, in affirming that the French took away whatever was most precious in the museum of natural history to enrich their own in Paris. The Paris museum need not be augmented with the fabulous spoils which the author enumerates, for if the skeleton of the Mastodon be excepted, it is as much superior to the other in the number and selection of the different articles, and in the order in which they are classed, as it is to the different museums in the French departments. It is unnecessary to mention the places of education at Madrid, not because they are insufficient in point of number, but because the sphere of their utility is very limited. The charitable institutions are more important; they are richly endowed, and the buildings reserved for them are spacious and cleanly kept. In the general hospital, the largest in Madrid, many unfortunate persons receive every sort of assistance, and in cases of disease, the best medical treatment the capital can afford. The churches are less remarkable for their architecture than for the number of their paintings.

Madrid is not more than two leagues and a half in circumference; the public walks are the garden of the *Retiro*,^c *Las Delicias* and the *Prado*, the last a very fine plantation, in which the principal avenue is often crowded with equipages, while the others serve as a place of resort for the burgesses. Two monuments, not unworthy of any capital, may be mentioned; these are the triumphal arch of Alcala^d and the gate of Toledo; the former, like the gates of Atocha and Segovia, leads to pleasant walks beyond the walls, and the latter to the majestic bridge over the Manzanares. In summer the river may be easily forded, which accounts for the advice of a jester, who counselled the king to sell the bridge, and purchase water with the money; but in winter the abundant rains, and in spring the sudden melting of the snow accumulated on the mountains, add so much to the breadth and impetuosity of its course, that the bridge is neither too long nor too solid.

The Spanish metropolis is a place of trade and industry;

the inhabitants manufacture woollen stuffs of every colour, carpets, silks, printed linen and muslins; government keeps up at a great expense very extensive porcelain works; lastly, a fair is held in the town, which lasts from the 21st of September to the 4th of October.

Madrid stands in the midst of a sandy and sterile plain, surrounded with mountains; but in the neighbourhood some places are not destitute of beauty. The Manzanares waters the *Prado*, the much admired palace,^e where Philip the Fourth found the duchess of Albuquerque, his mistress, in the arms of the duke of Medina de las Torres. Kings, like other men, are liable to such accidents, but Philip bore it not with becoming moderation, and the lovers might have speedily atoned for their crime with their lives, had not the royal rage been restrained by an attendant.

Few other towns of any consequence are situated in the same province. The ancient *Complutum* was ruined in the tenth century; Alcala,^f however, at no great distance from it on the opposite bank of the Henares, is celebrated not only for its university, the next in importance after the one at Salamanca, but also on account of several distinguished townsmen, among whom may be mentioned the historian Antonio Solis, the naturalist Bustamente de la Camara and the immortal Cervantes. In a different direction or at the distance of eight leagues to the north-west of Madrid, is situated the town of Escorial de Abajo, an ecclesiastical burgh, of which the lands belong to the Hieronymites, for whom the superstitious Philip the Second built the Escorial,^g an immense edifice, at once a monastery and a palace. The Spanish word *escorial* signifies an *exhausted mine*. It is not improbable, therefore, that there was formerly some sort of mine in the place, or that the name was applied to indicate the great size of the building, and the enormous quantity of granite used in the construction, the working of which has formed not merely a quarry, but a valley, that from its extent might be compared with the works of nature.^h The building forms a rectangle seven hundred and forty feet in length, and five hundred and eighty in breadth; the height from the base to the cornice is not less than sixty feet. The superstitious Philip, terrified after having lost the battle at St. Quentin, and not knowing to which of the saints he should address his vows, swore if on any future day, he should retrieve his lost fortunes, to raise the most magnificent convent in the world to the saint whose name then appeared in the calendar. Having gained a victory with the assistance of the English, he hastened to perform his vows; the day on which he was successful, was the anniversary of the saint and martyr Lorenzo;ⁱ a site for the building was therefore chosen near the village of San Lorenzo. The saint had been burnt to death on a gridiron, and that circumstance determined the form of the edifice; gridirons appear in profusion among the architectural ornaments, and figures of the same instrument are sewed or embroidered on the sacerdotal habits. Four towers, each two hundred and sixty feet high, erected at the four angles of the building, represent the feet of the gridiron, the apartments reserved for the king form the handle, and the eleven square courts into which the interior is divided, indicate the spaces between the iron bars. This

^g Span. *Escorial*.

^h We have adhered to the proper meaning of the word *Escorial*, but M. Miñano supposes the name of the palace to be derived from the Latin word *esculetum*, a forest of oaks, in allusion to the lofty trees, that formerly shaded the solitude of San Lorenzo. See *Diccionario Geografico-estadístico de España y Portugal*, art. *Escorial*.

ⁱ St. Lawrence.

wonder of Spain, as it has been called, cost the founder L.2.500,000,^a but the same wonder is one of the most gloomy and dismal residences that can well be imagined. The pictures that decorate the apartments, the chapel^b that serves as a place of interment for the royal family, the relics and the gardens, may be passed over in silence. The library contains nearly 30,000 volumes, and more than 4000 Latin, Greek, Hebrew and Arabic manuscripts.

The indolence and apathy of the Castilians are more apparent in the province of Madrid than in any other. It may be natural for the inhabitants themselves to be of a different opinion, but how else can they account for the small number of manufactories, and particularly for the inferior quality of their products? The places in the vicinity of the capital do not resemble those near the other great cities in Europe; the same movement and activity so apparent in the neighbourhood of London or Paris can nowhere be observed. It is only necessary to leave Madrid to be transported from the opulence and luxury of the capital to the wretchedness and misery that prevail in the country. The character given some time ago of the Castilian peasantry by a German traveller,^c is equally applicable to them at present; revolutions continued with little interruption for a period of thirty years have made no alteration in their manners and habits. The instruments of labour, their dress, and their food, proclaim the poverty and ignorance in which they are suffered to languish. Inveterate prejudice opposes itself to every improvement in agriculture and the mechanical arts. But this is not all; the disgust, which the sight of so wretched a population produces, is heightened by their filth; for from the dear price of linen, the trouble of washing it, and the notion that it is sooner worn out by being washed, the men never change their shirts more than once a month. The necessary consequences of the custom are a degree of uncleanness that occasions cutaneous diseases and the excessive multiplication of vermin. It is usual, not only in villages but in the populous parts of great towns, to see men and women destroying the vermin which they find on each other.

The *siesta*, a custom perhaps necessary from the heat of the climate, has been adopted since time immemorial in every part of Spain. At Madrid, the shopkeepers shut their shops from one to three o'clock in the afternoon; the workmen leave their work; all the inhabitants are asleep. In the evening, on the contrary, all are eager to enjoy the cool air; those who are idle, hasten to the public walks; the *cortejos* or gallants accompany the fair, and are continually engaged in performing those assiduous and minute attentions, which seldom fail to please a Spanish lady. Such attentions the women of Spain consider indispensable; it is certain, they have the art of captivating the men, and binding them when once subdued in chains that are only broken by length of years. The bonds imposed by the women, and the innumerable services they exact, not the vigilance of the police, have kept Madrid comparatively pure from the scandal of prostitution.

The towns in the province of Toledo are none of them distant from the banks of the Tagus. The small town of Talavera de la Reyna is situated below the confluence of the Tagus and the Alberche; the streets are crooked and

ill built; it appears probable from many remains of antiquity that it was the ancient *Libora*. It boasts of having given birth to the jesuit Mariana, celebrated as an historian, and to the learned agricultural writer, Alonzo de Herrera.^d This town has gained some celebrity by the battle fought under its walls, between the French and Anglo-Portuguese armies, on the 27th and 28th of July 1809.

Sylva, a Spanish historian, whose etymological researches are very frivolous, supposes that Toledo was founded five hundred and forty years before the Christian era by a Jewish colony, that called the town *Toledath* or the mother of nations.^{e f} The Tagus, which flows beneath the town amidst arid and naked rocks, the Moorish bridge over the same river, the elegant gate built by the Arabs, and the position of the town on a granite rock, form a sad contrast with the interior, where the only remarkable edifices are the cathedral, an ancient mosque, and the Alcazar, built by the Moors, repaired by Alphonso the Tenth, and embellished by Charles the Fifth, and the Cardinal Lorenzana. These edifices rise majestically above old buildings, and tortuous and dirty streets. The royal residence of Aranjuez, nearly seven leagues above Toledo, is surrounded with extensive and magnificent gardens; the Tagus washes the castle wall, and forms a cascade down an artificial terrace as broad as the space between the banks. A small town, built with scrupulous exactness after a plan laid down by government, rises near the palace.

The southern part of New Castile forms the province of La Mancha, in which three cities are contained, namely, Alcaraz, Almagro and Ciudad-Real, the capital. In the first, which stands on an eminence near the banks of the Guadarmena, are seen the remains of a Roman aqueduct. The second, situated in a very fertile part of the province, indicates by its name an Arabic origin; many persons from different parts of the kingdom, repair to its fair, which is held every year on St. Bartholomew's day. Ciudad-Real, famous for the tribunal of the *Santa Hermandad*,^g established by Ferdinand the Third in 1249, was also important for its manufactories and the number of its inhabitants. It contains three hospitals and a fine church dedicated to the virgin of Prado,^h the tutelar saint of the town.

Leaving the fruitful but ill-cultivated territory of La Mancha, its plains destitute of trees, its marshes and its pastures covered with flocks, we now enter Estremadura. The name of the province is derived from the two Latin words, *Extrema ora*; indicating it to have formed the boundary of the conquests gained by Alphonso the Tenth in the thirteenth century. The western extremity of the province still forms the boundary between Portugal and Spain. The Tagus and the Guadiana flowing parallel to each other from east to west, divide Estremadura into three portions, and the mountains of Mames and Montanches into two nearly equal parts. During the Roman empire it was the richest country in Spain, but now, the poorest and the worst peopled.

The inhabitants of Estremadura are more taciturn and grave than the other Spaniards, qualities which depend less perhaps on their physical constitution than on the nature of the country they inhabit; steep mountains, rapid rivers and the want of roads are so many barriers to communication.

^h *Virgen del Prado*.

Thus, the Estremaduran, completely isolated, becomes regardless of his welfare, and careless about improving his condition; hence his habitual indolence, the blame of which, however, ought not to be imputed to himself, but rather to the Spanish government. If the Estremadurans were excited by the hopes of wealth, or any stimulus of the same sort, they might be active, enterprising, and indefatigable; for no other people are more patient of labour, none braver in war; the best horsemen in the Spanish army are natives of Estremadura.

Plasencia on the banks of the Gertes is the capital of a district, and has at a distance the appearance of a fine town; the old walls in a state of tolerable preservation, six gates, five hospitals, an episcopal palace, and particularly the aqueduct composed of eighty arches, are the principal ornaments. The Roman inscriptions and other ancient remains in the same place attest its antiquity, but it is doubtful whether it bore in ancient times the name of *Ambracia* or *Deobriga*. Coria, encompassed with walls, in which the architecture of the Romans may be easily discovered, was without doubt the ancient *Caurium*, a place mentioned by Ptolemy, although a Spanish author supposes its name to be of Arabic origin.^a The situation of Coria on a hill, the church and the old dungeon, which are larger than any other buildings, give it an imposing appearance.

Alcantara, another chief town of a district, received its present name from the Arabians; it signifies the bridge, for when these foreigners took possession of the town, they were struck with the fineness of the Roman bridge over the Tagus; that magnificent monument of Trajan's reign has resisted the effects of time and political commotions. It rises to the height of 211 feet 10 inches above the river; it is equal in breadth to 27 feet 6 inches, and in length to 568 feet.^b Of the six arches the two in the centre are 94 feet wide.^c A triumphal arch with an inscription in honour of Trajan rises in the centre, and a mausoleum constructed by the Roman architect for his cemetery stands at the extremity towards the town. The same mausoleum owes its preservation to the enormous stones of which it is built; having been changed into a small chapel consecrated to St. Julian, it is at present an object of veneration both to the towns-people and the peasantry. The town was well known in the thirteenth century, when it became the metropolis of the military order of Calatrava, which then assumed the title of the order of Alcantara. The edifice belonging to these knights may still be seen; it stands in the highest part of the city. Alcantara, with the exception of its antiquities, contains nothing remarkable; indeed it might be difficult to explain the causes of its importance when subject to the Romans, but it must have been a place of considerable consequence, since the inhabitants were able to build the bridge and other monuments which are now in ruins. Different opinions are entertained concerning the ancient name of Alcantara, but it was probably the *Norba Cesarea*, which Pliny calls *Narbonensis Colonia*.^d

Several small towns are situated on the sides or at the base of a range of mountains that extends from the Tagus to the Sierra de Montanches. Of these towns Cáceres is the most important, the capital of a district, and the ancient *Castra Cacilia*. A statue erected to the genius of Augustus,

serves still to adorn the market place. Trujillo,^e the chief town of another district, was the Roman city of *Turris Julia*, and the birth-place of the famous Pizarro. Mérida, now an insignificant town, was formerly the most flourishing of the Roman colonies; as the epoch of its origin is unknown, the Spaniards attribute its foundation to Tubal, and affirm that it was first called *Morat*, a name, according to their own confession, derived from a Greek word, which may either signify a *mulberry tree* or a *tribe*,^f for it admits of a double etymology. It cannot, however, be denied that it was called *Emerita Augusta* by Augustus, when he gave it to his soldiers as a recompense for their valour. At the time of its splendour, it was nearly six leagues in circumference; the majestic remains, which it still possesses, are the best proofs of its past prosperity, and form almost the only inducement for the stranger to visit it. Mérida rises on the declivity of a hill on the banks of the Guadiana; the old bridge over the river has been attributed to Trajan; although of very different dimensions, it is not less remarkable than the one at Alcantara for its solidity and fine preservation. It consists of sixty arches, which extend to the length of two thousand eight hundred feet on a breadth of twenty-three. Another Roman bridge, in a very entire state, bears the name of *Puente de Albargas*. Beyond the walls are situated a theatre, a naumachia, a circus, the remains of three aqueducts, and four Roman ways. The town itself is little inferior to any in Italy in the number of its monuments; within the walls may be seen a fine triumphal arch, the ruins of several temples, columns, capitals, Roman inscriptions and other remains now used in building houses.

On the banks of the Guadiana, nearer its mouth and towards the extremity of the province, is situated Badajoz,^g the capital, and the ancient *Pax Augusta*, of which the Arabic name *Beledaix* denotes a salubrious country. Very different from Mérida, it contains no monument of past magnificence; a modern bridge, however, the work of Philip the Second, may vie with the ancient bridges in Emerita Augusta; it is formed by twenty-eight arches, equal in length to 1874 feet, and in breadth to twenty-three. The cathedral is adorned with fine paintings by Mateo Cerezo and Morales, the latter of whom was born in the town. Olivenza, a fortified town, was ceded to Spain in 1801, but in maps published since that period, it is marked by mistake in the kingdom of Portugal. Zafra, a small town, remarkable for the beauty of its situation, rises in the valley of Telares. Lastly, Llerena, the chief town of a district, appears to have been the ancient *Regiana*. It stands in a plain covered with olive trees, and commanded by the mountains of San Miguel and San Bernardo, continuations of the Sierra Morena. At a short distance from the town are the fruitful pastures of St. Martin, on which numerous flocks and several thousand oxen are fattened.

The fruitful province of Andalusia is bounded by the kingdom of Algarva, Estremadura, New Castile, Murcia and the Mediterranean; but before describing it more minutely, it may be as well to examine the Sierra Morena, formerly the retreat of the most intrepid bandits, and the terror of travellers, until a French engineer traced the famous road from Madrid to Cadiz. A tribute of praise too

may be offered to the memory of a sage and philanthropist; nay the traveller who crosses these mountains, may probably inquire by what fatality men entitled to the gratitude and reward of their country have so often suffered persecution and disgrace.

The mountains of the Sierra Morena, inhabited and cultivated during the time of the Moors, were after the expulsion of these foreigners, covered with forests, which afforded shelter to robbers and wild beasts. It was proposed during the reign of Charles the Third to bring the waste lands into cultivation, and to people the most fertile districts; Don Pablo Olavides, the statesman who formed the project, was entrusted with its execution; his plans were conducted with so much zeal and intelligence, that their success surpassed his expectation. Fifty-eight villages or burghs rose on the heights which command La Mancha and Andalusia. The country was called *Nuevas Poblaciones* (New Populations),^a and formed a province of which La Carolina, the capital, was soon peopled with three thousand inhabitants. But the virtuous Olavides was hated or envied by a monk belonging to the order of the Capuchins. Having been denounced for some indiscreet expressions, which had escaped him in the heat of debate, and having languished in the prisons of the holy office, he was condemned to eight years confinement in a monastery, declared incapable of holding any place under government, and deprived of all his possessions. Olavides escaped from his prison, and took refuge in France; he remained in that country during the most sanguinary period of the revolution, and was at last permitted to return to Spain. The disgrace of the same person, the changes in the Spanish government, and its diminished resources, have retarded the advancement of these settlements.

The Andalusian character is intermediate between that of the Spaniard and the Arab; with the vivacity natural to the inhabitants in the southern climates of Europe, they unite the imagination and carelessness of the people in the east. Sober and patient, they are always gay and lively although in a state of the utmost wretchedness, but necessity renders them active, industrious, and even ingenious in discovering resources. They are considered a boastful people, says M. Miñano,^b and this trait, together with their Arabic pronunciation, accounts for the epithets bestowed on them both by Spaniards and foreigners.

The kingdom of Jaen, one of the smallest of the seven provinces in Andalusia, is divided into five districts, the chief towns of which shall be briefly mentioned. Ubeda, a pleasant town of Arabic origin, stands on a declivity surrounded by mountains and mountain passes, between the Guadalquivir and the Guadalimar; it has its woollen manufactories, and carries on a considerable trade in horses, which are much valued throughout Spain. Baeza,^c the ancient *Beatia*, rises on an elevated table-land; the adjacent country is said to be very healthy. The bishop's palace, and the church of St. Mary del Alcazar, are not the only edifices which adorn the town; the streets are broad and straight, but it may be regretted that the population is not more numerous. Andujar,^d a well built town, and important from the industry of the inhabitants, is built on the right bank of the Guadalquivir, over which a bridge of fifteen arches has been erected. There are not fewer than three manufactories of painted pottery, thirty of earthen-ware, and

five soap works; it exports every year four hundred waggons of different kinds of earthen-ware, consisting principally of *alcarrazas*, which are used in cooling water by promoting evaporation. Some authors suppose that Jaen, the capital, was the ancient *Flavium aurigitanum*; a magnificent cathedral built in the form of a Latin cross, and on the site of an ancient mosque, twelve parish churches, fourteen convents and several hospitals render it when seen at a distance, like a town of forty thousand inhabitants, although the population amounts hardly to half the number. Martos, supposed to be *Tucci colonia*, is commanded by a very high rock, from which Ferdinand the Fourth precipitated two brothers of the name of Carvajal, who were suspected without any foundation to have murdered a knight of the family of Benavides. The two brothers protested their innocence in vain, and, according to a popular tradition, while they rolled from rock to rock, a voice was heard citing Ferdinand to appear on a certain day before the judgment seat of God; on the day mentioned, Ferdinand died at Jaen.

Lucena, a considerable town in the kingdom of Cordova, and the capital of a district, carries on a trade in wine. Montilla, also the chief town in a district, is a place of greater industry, although less populous than Lucena. Four potteries, several linen manufactories, fifty oil mills and many other establishments tend to enrich its laborious inhabitants. Bujalance, which many consider the Roman city of *Calpurnium*, is situated in a large and fruitful plain that lies to the left of the road from Andujar to Cordova. The trade of the place consists in cloth and woollen stuffs.

At the distance of some leagues from Cordova, on the road that leads from Andujar, one of the finest bridges in Europe has been erected over the Guadalquivir, near the *Venta de Alcolea*. The entrance into the celebrated Cordova, the Roman *Corduba*, is not calculated to give the stranger a favourable opinion of the town. A mass of houses built without any regularity or elegance form many narrow, crooked and dirty streets. The space which the town occupies, although very great, consists for the most part of gardens; it is enclosed by old walls, flanked with large towers of Roman or Moorish construction. One monument, the only relic of Moorish power, attracts notice; it is the magnificent mosque built by Abdalrahman in the year 770, long a principal temple of Islamism, and second only to the one at Mecca; at present the sacred images of the catholic worship rise round the verses of the Koran. The edifice forms a rectangle of 620 feet in length by 440 in breadth, including an extent of 210 feet, which is laid out as a garden, and enclosed with walls and arcades. A great many pillars arranged in quincunx are crowded in the interior of the building; indeed it is affirmed that there are not fewer than 850 of different materials, such as marble, granite and porphyry. These columns are without bases or rest on very low pedestals, but they are adorned with elegant capitals, and support a double row of arches. Not far from the mosque or *mezquita*, as the Spaniards still call it, is a fine bridge of sixteen arches built over the Guadalquivir by the Romans and the Moors. In the neighbourhood of the town are seen the ruins of a building which the people call the house of Seneca; it cannot perhaps be determined whether the tradition be well or ill founded, but it is certain that Cordova was the birth-place of both the Senceas, and

Andalusia.

^d Anduxar.

^c Baeça.

of Lucan, Avicenna, Averroes and Gonzalvo Fernandez, better known by the name of Gonzalvo de Cordova. In the time of the Moors, the population amounted to 300,000 inhabitants; in the seventeenth century it was reduced to 60,000; at present it does not contain more than 46,000. While the Romans and the Moors were masters of Spain, Cordova was a place of great trade and industry; the inhabitants are still employed in dressing morocco leather, an art which they learnt from the Saracens; the other manufactures are ribbons, gold lace and hats.

The two provinces that have been last mentioned are not together more important than the province of Seville. Ecija, the Roman *Stigis*,^a one of the largest towns in the province, stands between two high hills on the banks of the Genil, over which a stone bridge is erected; the heat during the greater part of the year is so excessive that the Spaniards call the town *la sartén de Andalucía*, or the frying-pan of Andalusia. Carmona, an opulent and well built town, is mentioned by ancient writers, and it still retains its ancient name; two of the gates that communicate with the town were built by the Romans. It possesses at present a considerable trade, consisting of cloth, soap, linen, pottery and morocco leather.

Seville, a town founded by the Phœnicians, consequently one of the oldest in Spain, was also one of the most celebrated both in ancient times and during the middle ages. It is still a place of great importance both from its size, the number and magnificence of the public buildings, and the wealth and industry of the inhabitants. It was called *Hispalis* by the Phœnicians on account of the fruitful country in the vicinity. Julius Cesar gave it the name of *Julia Romula* in vain, for the Arabs by changing it into *Sevilla*, indicated the fruitfulness of its situation, and thus rendered its present name analogous in meaning to the one of Phœnician origin. Seville is admirably situated; the horizon is bounded by mountains, of which the nearest belong to the Serrania de Ronda, and terminate towards the west the long chain which includes the Sierra Nevada. It rises in the midst of a plain covered with olive plantations, hamlets, villages and convents; the Guadalquivir, which fertilizes the same plain, winds at the base of the walls. The latter, flanked with 166 towers, form a circumference of two leagues, exclusively of the suburbs; if these be taken into account, the extent may be nearly doubled.^b The population of Seville was probably exaggerated at the time that Saint Ferdinand took it from the Moors; in this way the Spanish writers were perhaps desirous to magnify the glory of the conquest. It is certain, however, that since the same period the population has considerably diminished. At the beginning of the eighteenth century, it contained 130,000 inhabitants, while the cloth and silk manufactories furnished employment to 16,000 workmen; at the end of the same century, the population was reduced to 100,000, and not more than a thousand workmen were employed in its manufactories; the number of inhabitants at present does not exceed 91,000.

The Spaniards, accustomed to extol the beauty of their country, express their admiration of Seville in the following popular couplet:

^a *Astygis*. D'Anville.

^b "—will be more than doubled."

^c "In most of them, the marks of the axle-trees may be seen on either side"—i. e. on the walls of the houses.—P.

^d The interior of the city is chiefly built in the Moorish style, the streets being so narrow that a person extending his arms can touch the houses on either side.—Ed. Encyc.

Que non a visto Sevilla
Non a visto maravilla.

But Seville, with all its wonders, is a very gloomy and dirty town; the streets are so narrow that it is not safe or easy to pass through them in a carriage, yet the marks of wheels may be seen in most of them;^c in some even, a person with his arms extended might touch the opposite houses.^d There are in the town and suburbs, 564 streets, 12,055 houses, 62 squares and 32 churches. Of the fifteen gates some are of good architecture, and the one that leads to the Triana, the largest of the suburbs, forms a triumphal arch adorned with Doric columns.^e The public buildings in Seville are the greatest ornaments; among those worthy of notice are the archbishop's palace, a large and richly decorated edifice; the alcazar or palace of the Moorish kings, a work completed by Peter the Cruel and his successors, and remarkable both for the elegance and singularity of its form, and the fine gardens that surround it; also the town-house, the cannon foundery, the college of St. Elmo, the snuff manufactory, and the Lonja or exchange, a square building of Tuscan architecture, where the archives relative to the discoveries made by the Spanish navigators are preserved. The cathedral church, more imposing than any other edifice, and one of the largest in Spain, was built in the beginning of the fifteenth century. It is 400 feet in length, 300 in breadth, and 150 in height; the interior is divided into nine naves, adorned with statues, paintings and tombs. There rest the ashes of St. Ferdinand, the Spanish St. Louis, of Alphonso the Wise, both a king and an astronomer, and lastly of Christopher Columbus, on whose tomb is engraved the following simple epitaph:

A Castilla y Aragon
Otro mundo dió Colon.^f

The most curious part of the cathedral is the celebrated tower of the Giralda, the work of Geber, an Arabian architect, who raised it to the height of 250 feet, but in the year 1568, the height was increased by a hundred feet. From this square tower the view extends to the distance of more than fifteen leagues. No stair leads to the summit, but an inclined plane which is said to be of so gentle an acclivity that a horse might ascend it at full trot; it is very doubtful if the experiment has ever been tried. The cupola is surmounted by a gilt bronze figure representing Faith, and serving the purpose of a weathercock;^g although weighing more than thirty-four quintals, it is turned by the gentlest breeze.

The amphitheatre of Italica has been considered the finest ancient monument in the neighbourhood of Seville; it was formerly the principal ornament of *Santi Ponce*, now an insignificant village, but once a flourishing city,^h the chief town in a diocese, and the birth-place of three emperors, Trajan, Hadrian and Theodosius.

The remaining towns in the province may be briefly described. Urera was probably the ancient *Orippe*; it is small but well built; the walls have been destroyed; the adjacent country is fruitful in olives, vines and pasturage, on which excellent horses are reared. Moguer possesses an ecclesiastical tribunal, an hospital, two convents, two Latin schools, and a port on the Tinto, from which wines and the

^e The following verses are inscribed on the gate of Carne:

Restituit Christo Fernandus tertius heros.

^f Columbus gave another world to Castile and Arragon.

^g Don Juan Agustin Cean Bermudez, *Descripcion artistica de la Catedral de Sevilla*.

^h The city of Italica.

other products of the province are exported; but the principal trade consists in spirits; there are not fewer than sixty brandy distilleries in the town. Huelva, the chief town of a district, at the confluence of the Odiel and the Tinto, stands on the site of *Onuba*;^a the port is perhaps as much frequented as the one at Moguer. Lastly, Ayamonte, a fortified town at the mouth of the Guadiana, on the confines of Andalusia and Portugal, has been enriched by commerce and sardel fisheries.

A recent subdivision of Seville forms at present the province of Cadiz. San Lucar de Barrameda, the nearest place in the province to Ayamonte, lies at the mouth of the Guadalquivir; as it was formerly called Lucifer,^b it has been supposed that the god of light was worshipped in the town; it carries on a trade in wines, the produce of the adjoining districts, and in different sorts of liqueurs. The neighbouring country is very fruitful, but on the opposite bank of the river, sandy plains as sterile as the deserts of Africa extend to a considerable distance.

Rota, a place celebrated for its wines, rises on the coast. Xeres or Jerez de la Frontera, the ancient *Asta Regia*, stands at the foot of a hill in a very fruitful part of the country.^c The produce of the vineyards amounts annually to 7758 tuns;^d it is deposited in cellars which from their extent and solidity may be mentioned among the curiosities of the town. An old wall in which arcades and passages have been cut, divides Xeres into two parts. On one side of the wall, the streets are narrow, and the houses are ill built; on the other, the streets are broad and regular, composed chiefly of neat and well built houses. The royal castle, remarkable for its large towers, appears to be a very ancient building. Arcos de la Frontera, a small town with long streets, ill adapted for foot passengers, because they are wholly unpaved,^e rises at the distance of four leagues from Xeres on the steep banks of the Guadalete. It is situated in the same district as the last mentioned town; antiquaries consider it the ancient *Arco-briga*.

It is necessary to cross the Guadalete to visit Cadiz, that important city, whose inhabitants are said to be the most civilized in Spain, but who imprudently and without any chance of success erected twice the standard of liberty in the course of fifteen years. *Gaddir*, which signifies a fortified place,^f was the ancient name of Cadiz; the same name was afterwards changed into *Gades* by the Greeks and Romans. Strabo attributes the foundation of Gades to the Phœnicians;^g he compares it with the most powerful cities in Italy; although the inhabitants, says the geographer, possess only a small island and but little land on the continent, they arm the largest and the greatest number of vessels that are employed in the commerce of the Mediterranean and the ocean. Cadiz, from the advantages of its position, may still be ranked among the most commercial towns in Europe. That part of the Spanish coast has undergone

^g L. III. c. 5. § 4.

^h This last assertion is not in the original. "The well water in Cadiz is hard, brackish and unwholesome; what is generally used is brought from the port of St. Mary, in boats kept for the purpose; what they use for washing and other domestic purposes, is the rain

water which falls in the inner courts of the houses, and is collected in cisterns." (Ed. Encyc.)—The inhabitants of Cadiz ascertained during the siege that the water in their cisterns is proper for all uses. (M. B.)—P.

many changes since the time of Strabo; it is probable that the natural mole which unites Cadiz with the isle of Leon did not exist in his time, and that Gades was situated on an island, which has since become a peninsula. This opinion appears to be confirmed by Pliny, who says that the town is situated on an island near the island of Juno, which can be no other than that of Leon. Cadiz is at present the chief town in one of the three maritime departments in Spain. Defended on all sides by ramparts and bastions, nature as well as art have contributed to its safety. It is guarded by sand banks and rocks towards the north and the west, and on these rocks are the two forts of St. Catherine and St. Sebastian. To add to its security, the Cortadura or canal has been cut across the isthmus that unites it to the isle of Leon, and by this means all communication with the latter may be easily intercepted. The blockade made by the French lasted from the year 1809 to 1812, but the only inconvenience which the inhabitants sustained, was that of bringing water at a considerable expense from the port of St. Mary, for there are no wells or springs in the town.^h The houses are well built and whitened with great care; their projecting roofs may darken the streets, but they serve as a shade against the rays of the sun. The town as a whole may bear a comparison with any other in Spain, but the edifices are by no means remarkable; the cathedral is small and shabby;ⁱ the townhouse is an irregular edifice of very ordinary architecture; the prison is without doubt the finest building in Cadiz. The good order that prevails in the interior of the prison, and the discipline to which the prisoners are subjected, are creditable to the public functionaries. If it be considered that besides the founding hospital there are five others, one of which contains more than 800 persons, who are cleanly and well kept, it may be allowed that the inhabitants are neither deficient in charity, nor injudicious in the method of administering it. The people of Cadiz are said to be better informed than the other Spaniards; at all events, if they are not so, it is not for want of schools; the city contains, besides many others, a seminary and college, of which the professors and teachers are jesuits, an academy of fine arts, a naval seminary, and schools of mathematics, surgery and medicine.^k

The isle of Leon^l is separated from the continent by an arm of the sea 600 feet in breadth, which the Spaniards call the *Rio Santi-Petri*; a bridge erected over it communicates with the road that leads to Medina Sidonia, a small town on the summit of a conical rock, famous for its medicinal waters and a particular sort of clay, so well adapted for making bricks and earthen ware,^m that these articles are exported to most parts of Andalusia. The name of the town is of Arabic origin, but the number of Roman inscriptions renders it probable that it was the ancient *Asindo*. The town and harbour of Tarifaⁿ are situated on the coast at the distance of five leagues from lake Janda, and at the

water which falls in the inner courts of the houses, and is collected in cisterns." (Ed. Encyc.)—The inhabitants of Cadiz ascertained during the siege that the water in their cisterns is proper for all uses. (M. B.)—P.

ⁱ The new cathedral, when finished, if executed according to the plan which it now displays, will be one of the most magnificent structures in Spain; it is, however, defective, both in elegance and simplicity. The old cathedral is chiefly remarkable for its pictures and treasures. (Ed. Encyc.)—P.

^k—"a seminary, a college of Jesuits, and also schools of the fine arts, navigation, mathematics, surgery and medicine."

ⁿ Tarifa.

southern extremity of Spain. It was the Roman *Mellaria*, a place of some repute for its salt works^a in the time of Strabo. As a fortified place, it may be of considerable importance; but the inhabitants have attempted without success to unite it to the small island of the same name, and from which it is only separated by the distance of three or four hundred feet.^b

The road that leads to the province of Granada, the most important in Andalusia, is at one part not more than two leagues removed from Gibraltar, an almost impregnable rock that has belonged to the English since the war of the succession; an account of it shall be given in the description of the English possessions.

In the rich country now to be described, where the towns rival each other in industry, one may ascend from the low and burning plains on the Mediterranean to the cold regions which have given the name of Sierra Nevada to the principal chain which extends through the province. Cool springs temper the heat of the climate, and the meadows are enamelled with flowers; the same province is intersected with delightful vallies, and better watered than any other in the Peninsula; it has been so much favored by nature, that it was the last which the persecuted Moors determined to abandon. Granada^c contains besides several important towns. Ronda, the first town on the road towards Madrid,^d is divided into two parts by a frightful precipice, which reaches from the summit to the base of the height on which it is built. The chasm is about five or six hundred feet in depth, and a torrent flows through it. The torrent, which is called the Gaudalvin, an Arabic word that signifies literally a hollow stream, lower down takes the name of the Guadiara, and falls into the sea between Estepona and Gibraltar. Two bridges connect the two quarters of the town; the largest or the new bridge is so much elevated above the torrent that the passengers can hardly hear the noise of the waters. A stair consisting of 400 steps leads to the cascade of El Tajo. Ronda, as its name indicates, stands on the site of *Arunda*, a place mentioned by Pliny and Ptolemy. The ruins of the ancient *Acinipo*, the present *Ronda la Vieja* or Old Ronda, are not more than two leagues distant. The remains of a theatre may be still seen; several inscriptions, medals and statues have of late years been discovered. Estepona, a maritime town, is situated at the base of the Sierra Verneja or vermilion mountains, well known for their mines of plumbago. Marbella,^e the chief town in a district abounding with minerals, might become an important place, if the roads were kept in such a state as to afford better means of communication; it exports different manufactures, and many vessels frequent the port on account of the fisheries in the neighbourhood. The streets are straight; it is adorned with several fountains and a fine public walk, from which the view extends over the Mediterranean. According to a tradition, the same view was so much admired by Ferdinand and Isabella, that the queen, struck with the beauty of the sea, exclaimed, *Que mar tan bella!* which exclamation, say the chroniclers, accounts for the name of Marbella. Whatever the origin of its present name may have been, it cannot be doubted that the place is very ancient; it has been supposed that it was called *Barbesola*,

^a *ἡ αἰγιαλὸς ἔχρησα*. Strab. Lib. III. p. 140, Ed. Par. 1620.

^b "—by a channel a few hundred feet in breadth."

^c The kingdom of Granada, divided into the provinces of Malaga and Granada. The towns which follow, from Ronda to Antequera inclusive, belong to the province of Malaga.—P.

^d Qu. Cadiz Ronda is situated near the western extremity of the

but it may be considered more probable that it stands on the site of *Cilniana*, a town mentioned in the Itinerary of Antonine.

It is only in the latter part of the year that rains are common in the fine climate of Malaga; in other seasons, the sky is almost always serene and cloudless. The base and sides of the mountains that enclose the bay on which Malaga stands, are covered with olive and orange trees, and fruitful vineyards, or varied with cotton fields and plantations of sugar cane. Thus situated, the town enjoys the advantages of a fine climate and a convenient harbour. The men are affable and polite; the women are considered the fairest of any in Andalusia. Malaga is encompassed with a double wall, defended by bastions and a castle built by the Moors, on the summit of the rock which commands the town. Two extensive moles shelter the harbour against every storm; on one of them revolving lights have lately been erected. The Alameda, or public walk, is surrounded with elegant houses, and adorned with several statues and a fountain. The inhabitants are supplied with water from a fine aqueduct, a work which Molina, a wealthy citizen, built at his own expense. Most of the old Moorish houses have been replaced by modern buildings; the episcopal palace, a very large edifice, is built in the best style of architecture; the cathedral has been equally admired; its tower reaches to the height of 260 feet. The present town rises near the site of the ancient *Malaca*, a place of great trade, which Strabo affirms was founded by the Phœnicians.

The rich vineyards of Malaga produce annually about 13,340 tuns^f of wine. There are not fewer than thirty different sorts of grapes; they are classed according to the seasons in which they ripen. The early grapes are collected in June; they yield a thick and sweet wine which is prized by many; they are valuable, too, in as much as they furnish the best raisins, a very lucrative branch of the Malaga trade; but for that purpose they must be cut at the middle of the stalk, and allowed to dry fifteen days in the sun, when they are afterwards packed. The ordinary grapes are gathered in September, and their produce furnishes the strong and dry wines, which are exported into different countries. But the late grapes produce the best wines; one sort, called the *guindas* wine,^g brings the highest price; it derives its name from the buds of a particular cherry-tree, which are put into the vats. The products of Malaga are exported by the nations that consume them; out of all the ships which enter the harbour, certainly not more than a seventh part are Spanish vessels.

A road that winds along the coast, leads from Malaga to *Velez Malaga*, which although insignificant in point of population, is a place of considerable industry and trade;^h it stands on the site of *Menoba*, and the vineyards in the neighbourhood are almost as much famed as those of Malaga.

Antequera, the ancient *Antecaria*, situated between the mountains of the same name and the Guadiaro, contains a greater number of inhabitants than the last mentioned town. The Lovers' Mountain (*Peña de los Enamorados*) rises in the vicinity; it has been celebrated by an act of heroism not unexampled in the history of Spain during the middle

province, to the eastward of Cadiz and to the northward of Gibraltar.—P.

^e Marvella.

^f "160,000 hectolitres."

^g *Vino de guindas*—from *guinda*, a cherry.—P.

^h "—a small industrious and commercial town"—Population in the statistical table, 14,000.

ages and even in modern times. A Christian knight had been taken prisoner by a Moorish prince; during his captivity he fell in love with the daughter of the infidel; resolved to celebrate their union in a Christian country, and at the foot of the altar, they had proceeded to the frontiers, when they were overtaken by the prince and his troops; they sought a hiding place in the caves of the mountain, but the enraged father ordered the soldiers to seize the fugitives. His daughter remonstrated that she was a Christian, and that she had married, and threatened to destroy herself if he approached; but the father was inexorable, and the two lovers rushed headlong from the summit of a precipice. A cross indicates the place, and serves still to commemorate the event.

The province of Granada is divided into two nearly equal parts, the northern and the southern. The towns in the southern are either ports, or situated at a short distance from the sea. Almuñecar,^a of which the harbour is sheltered from the east and west winds, stands at the foot of a hill, where are seen the remains of a citadel, that was used as a treasury by the Moorish kings, and also as a prison for their ambitious relatives. The country round Motril is fruitful in the sugar cane, and according to the Spaniards, the rum extracted from it, is not inferior to any from the West Indies;^b the town is about two leagues from the shore; it stands on a road that leads in one direction to Málaga, in the other to Almería, a city that has been for ages wealthy and industrious, occupying the site of *Murgis*, a town of which the origin is lost in the night of time; the harbour, which the ancients called *Portus Magnus*, is still well frequented.

Loja^c situated at the foot of a chain that bears its name, on the left bank of the Genil, is noted for its salt springs. Alhama, of which the Arabic name signifies a *thermal spring*, stands higher above the level of the sea than any other town in Europe. The Moorish houses, the old walls that encompass it, and other peculiarities render it difficult of description. The country above it is covered with snow during six months, and scorched by the sun the rest of the year. The baths at a quarter of a league from the walls, are much frequented. The waters are sulphureous and slightly coloured; the place from which the spring issues is arid and desert. When the rays of the sun fall on the water in the baths, it exhibits a singular appearance, in as much as it seems to be covered with an unctuous film; in cold weather vapours rise from it, and the channels through which it flows are lined with a white and soft substance. The road to Velez Malaga extends across the mountains of Alhama, and the traveller observes a curious passage, the Puerta de Zaflaraya, a natural gate in the midst of high rocks; no sooner has he passed it, than very different scenery appears before him; the eye wanders over an immense extent of country, embracing the southern declivities of the Bætic range, the coasts of Granada, the Mediterranean, and the African shores.

But the same road leads to the important place which proved fatal to the Moorish power in Spain.^d On the left bank of the Genil, and in a pleasant country, is situated the town of Santa Fe, which was almost destroyed by an earthquake in 1807. It was founded by the Castilian heroine, the wife of Ferdinand the Catholic. During the

siege of Granada, the queen made a vow not to change her shift until the capital had opened its gates. To intimidate the enemy her camp was changed into a fortified town, and the town was called Santa Fe. The Moors fought long and valiantly, but it appeared at last that resistance was vain. It was observed that the queen's shift had been so long worn that it assumed a yellow hue; hence the origin of what is called to this day an *Isabella colour*. It was also within the walls of Santa Fe that Ferdinand and Isabella approved of the first expedition undertaken by Christopher Columbus.

The walks on the banks of the Genil indicate the approach of Granada, through which the Daro flows; it is encompassed by woods, and watered by limpid streams, while the gardens and groves on the neighbouring heights diffuse their fragrance to a distance. The Sierra Nevada is about half a mile^e from the town; its summits are covered with eternal snow, but the cold of winter is never felt at its base. Granada was founded by the Moors; the present state of the town may be contrasted with what it was in the time of its splendour. When the crescent rose above the mosques, it contained 400,000 inhabitants; it occupied a circumference of three leagues, which was defended by more than a thousand towers. It is still adorned with several fine buildings; there are two large squares, and sixteen of a smaller size, many public fountains, seven colleges, eleven hospitals, an elegant theatre built by the French, and sixty-three churches, the most remarkable of which are the churches of San Gerónimo, Santa Cruz, San Juan de Dios, and the cathedral, the latter an imposing edifice, in which are contained the tombs of Ferdinand and Isabella, of Philip the First, and of Queen Joan. But these edifices appear insignificant near others for which the people of Granada are indebted to the genius and luxury of the Arabs. Charles the Fifth, during the splendour of his power, erected in vain a palace which was to surpass in magnificence whatever had been constructed by the Moors; for in beholding this palace which was planned and executed while the arts were reviving in Europe, one does not so much regret that it remains in an unfinished state, as that a part of the Alhambra was destroyed in order to obtain a convenient site. This edifice of Charles the Fifth, although large, and adorned with porticos and the most costly marble, is infinitely inferior to the Moorish palace and fortress, in which the apparent freshness of the ornaments, the galleries supported by light columns, the elegance of the courts, and the arcades that surround them,^f indicate its superiority over the modern buildings in Granada. The same town was the birthplace of the poet Hurtado de Mendoza, and of the jesuit Suarez, who has obtained a sad celebrity in the provincial letters of Pascal. At a short distance from the walls may be seen the site of *Eliberis*, a Roman town, where valuable antiquities have been discovered.

Guadix, situated in a valley on the banks of the Rio Guadix, is the metropolis of a district; it was within its old walls that the Moors made a long and obstinate resistance after the conquest of the capital. It stands probably near the site of *Acci*, a Bætic city; that it does so might be inferred from the ancient name without any other proof, for by prefixing the word *guadi*, which signifies *running water*, the Arabs changed it into *Guadiacci*, which has since been corrupted into Guadix. The country round Baza abounds

^a Almuñecar.

^b "—is equal to that of Jamaica."

^c Loja.

^d Granada

^e "A quarter of a league."

^f "The elegance of the court of the baths, and the arcades surround the court of the lions—"

in hemp and flax; the town rises in a fruitful valley at the foot of a mountain which bears its name; it was the ancient town of *Basti*, the capital of the *Bastitani*. Lastly, Huescar, situated in the same district as Baza, and on the banks of the Barbato, carries on a trade in woollen stuffs; the village of Huescar la Vieja near its walls is all that remains of *Oscá*, a place founded by the Carthaginians.

Another province on the continent remains to be described, namely, that of Murcia, formerly entitled a kingdom, and contiguous to Andalusia, New Castile and the province of Valencia. It hardly extends beyond the basin of the Segura; it is divided into nine districts.

Lorca, one of the most important towns in the province, is the ancient *Eliocroca*; its situation on the northern declivity of the Sierra del Caño, rendered the calamity that befel it in 1802, more disastrous. A reservoir in which the streams of the neighbouring torrents are collected, and which serves to supply the country people with water for the irrigation of their lands, burst suddenly, inundated all the lower part of the town, and destroyed more than six hundred persons together with a great number of cattle. The loss sustained by the inundation in the country and in the town was calculated at 50,000,000 reals.^a Murcia, a wealthy and populous city, is situated in a plain intersected by the Segura, the waters of which are confined by an embankment. The cathedral is the finest edifice, but both the outside and the interior are loaded with ornaments; the other public buildings are the townhouse and the royal silk manufactory;^b the raw material with which the last is supplied, forms the principal wealth of the district. It appears from Roman inscriptions and other antiquities that Murcia was formerly called *Vergilia*. Carthage, the most important town in the province, both from its commerce and its port, which may contain forty ships of the line, and a great many smaller vessels, was founded by Asdrubal the Carthaginian. The territory in which it is situated, separated from that of Murcia by lofty heights, contained so many mines that it was long to the Romans what Mexico was afterwards to the Spaniards. They worked silver and different useful metals. A very large cavern, about three miles^c distant from the town, now called the cave of St. John, is nothing else than an ancient mine. The thermal springs in the neighbouring mountains are still frequented, and many labourers are employed in working alum. Carthage, one of the finest cities in Spain, is defended by several forts along the coast, and also by the fortress of Atalaya on an eminence which commands the walls. The naval arsenal is very large; the yards, docks and rectangular basin occupy nearly the western half of the town. The cathedral is the most remarkable edifice; it is formed by three naves, and within them are contained several richly sculptured altars. The depth and size of the harbour in this chief town of a maritime department are not the only advantages which it furnishes to the Spanish navy.

Ivica or Ibiza,^d one of the Balears, at no great distance

^a "The loss sustained by the inundation in the neighbouring country was estimated at more than 50,000,000 reals"—The loss was estimated at 200 millions of reals. (Ed. Encyc.)—P.

^b "The townhouse and the building in which silk is prepared"—There is in Murcia, a considerable establishment for spinning and twisting silk. (Rees' Cyc.)—P. ^c "Three leagues."

^d See p. 827. The *b* and *v* in Spanish, are interchangeable, as well as the *z* and *c*. Many Spanish proper names, with *z* or *c*, are written with *s* simply in English authors.—P.

^e In Valencia.

^f Ivica.

'Junc.' rushes—properly of esparto grass. See page 843, note a.

from Carthage, is still nearer the port of Denia;^e Iviza, the capital, stands on the declivity of a steep rock, which rises near a bay; on the summit of the same rock are the bishop's palace, the cathedral and the governor's castle. The town is encompassed with walls, which although they are no security against the attacks of pirates, defend it at least against the natives of the island; for the latter are so much oppressed by taxes, that finding it impossible to pay them, they are apt to revolt. The country round the town is marshy but fruitful in cotton; the rest of the island abounds in a sort of pitch obtained from the Aleppo pine (*Pinus Halapensis*), and which along with the produce of the salt works forms the two principal branches of commerce.

Ivica contains besides some scattered groups of habitations that have been dignified with the name of villages. If the inhabitants are rude and uncultivated, it should be considered that they have been long degraded by superstition and poverty. Their songs consist of one or two modulations; the monotonous sounds of the flagelet, accompanied with the tambourine and the castanet, make up all the music that they use in their wild and ungraceful dances.

The costume of the peasants consists of a short jacket and tight pantaloons that reach to the middle of the leg; they wear a red woollen cap; their *spardilles* or shoes resemble in form the wooden shoes worn by the French; they are made of matweed,^f and attached by cords of the same substance. The dress of the women is more elegant; they wear a large round hat a little inclined on one side, and a handkerchief that covers the neck and descends to the waist, but open behind in order to display their long hair; three necklaces of different sizes are placed above the handkerchief, to two of which crosses are attached;^g a narrow but richly embroidered apron contrasts well with a dark petticoat; the *spardilles* are of the same shape as those worn by the men.

The singular manner by which marriages were celebrated in the Balearic islands in the days of Diodorus Siculus, has been mentioned in the account of the ancient inhabitants. The present custom, which appears to have originated from the ancient, although less immoral, is not less ridiculous. As soon as a villager obtains the consent of his future bride, he is considered by her parents as one of the family; but the ceremony does not take place until the end of a year^h at least; within that period, the young lads in the neighbourhood are permitted to visit the bride on certain days, and to remain alone with her; according to a French traveller, they emulate each other in dissuading her from her purpose by enumerating the vices and bad qualities of her intended husband; the bride is constrained to hear them without a murmur, and as the lover must leave the room when they enter, he suffers during his absence the same vexation which, in all probability, he has before inflicted on others.^k

Formentera or, as the Spaniards call it, Formentera, is so near to Ivica, that it might be easy and without doubt useful to unite them.^l The inhabitants are scattered in

^h "A large round hat, a little inclined on one side, covers a handkerchief which is tied under the chin and descends to the waist, but is open behind to display their long black hair: three necklaces of different sizes are arranged on their bosoms, to two of which a cross is suspended." ⁱ "Two years"

^k M. J. Cambassède, Excursions dans les îles Baléares.

^l Qu. in description. It is separated from Ivica by a channel above two miles wide (Ed. Encyc.)—4 miles (Crutwell.) The island of Formentera is south of Ivica two miles and a half; the passage between being called the Channel of Yvica. Tuckey's Mar. Geog. vol. II. p. 176—P

several villages; the island has been represented as infested with serpents, wolves and foxes, but the only animals in the woods and meadows are sheep and goats, which from neglect have become wild; the flamingo and other birds of passage abound on the shores.

Cabrera, at a short distance from Majorca, is inhabited by some shepherds, whose wealth consists in their goats. It is well wooded, and three springs serve to supply the inhabitants with wholesome water. The sufferings which the French prisoners experienced on the island about the end of the last war, must ever be remembered with regret by the friends of humanity; they were allowed to perish for want of food, and their bones scattered on the island, attest the cruelty of those to whose care they were entrusted.^a

The island of Majorca contains sixteen towns, and the average population of each may amount to 4500 inhabitants;^b but Palma, the capital, peopled by 34,000, is the only one worthy of being described. It is encompassed with walls about seven or eight feet thick, with thirteen bastions fifty paces in breadth, and commanded by a castle on the hill of Belver. The houses are built of stone, but the excessive breadth of the balconies darkens and confines the streets. The Lonja, which rises near the port, is the only edifice that recalls the former splendour of the town. The tomb of Jayme II.,^c king of Majorca, serves to adorn the cathedral; his father conquered the Moors, and took possession of the island in the year 1229. The town, long the principal mart for the commerce between Europe and the east, carries on at present no more trade than what is necessary to supply the wants of the islanders. The Jews are despised by the other inhabitants; many of them are employed in manufacturing jewellery and trinkets.

The *Pages* or rural inhabitants of Majorca wear a very different dress from that of the people in Ivica; a round jacket without a collar, sandals, bare legs and loose breeches render their costume not unlike that of the Greek peasants, but they may be distinguished by a broad hat, which serves to shade the visage. The women wear sandals; in other respects their dress differs little from that worn in Ivica.^d The people may be perhaps more superstitious than those in Spain, but they are also more hospitable; as there are no inns in the island, they never refuse to admit strangers, and to share with them whatever they possess.

The people in Minorca resemble those of Majorca in their manners and in their dress, but they are said to be the least superstitious of the Spaniards. Five towns are situated on the island. *Janna*, now Ciudadela,^e was probably founded by the Carthaginians; with the exception of Mahon, the capital, it is the largest town in Minorca. Broad and straight streets, and clean and well built houses, render Mahon an agreeable residence; the cathedral and townhouse^f correspond ill with the rest of the city. The boldness of their pirates,^g and the safe retreat afforded by their harbour, enabled the inhabitants to amass considerable wealth during the war against Napoleon. The harbour indeed is one of the

finest in the Mediterranean; the celebrated Andrew Doria is said to have been the author of a Spanish proverb, according to which, the only four good ports in that sea, are June, July, August and Port Mahon.^h It is about a league in length, and a thousand or twelve hundred yardsⁱ in breadth; the sides are formed by two steep heights. The breadth of the entrance is about 300 yards,^k and vessels can sail in the neighbourhood, without being endangered by rocks.

Having thus endeavoured to describe the principal towns in Spain and its islands, it remains for us to make one or two remarks on the commerce and industry of that fine country. It has been already seen that it abounds in soda, salt, iron and different metals, that it produces oil, fruits and wine, the best wool in the world, and silk that is only surpassed by that of Italy. The value of the wines, which the Spaniards consider the most lucrative of their productions, might be considerably increased, if any thing like an equitable system of duties were introduced. It exports at present about twenty-five or thirty thousand casks, and the price obtained for them does not exceed L.625,000. The silk in the provinces of Arragon, Valencia, Granada and Murcia, might soon rival any in Italy, if exportation were encouraged, and the mulberry cultivated with care. The mines, although rich in different metals, do not afford all the advantages that might be expected from them. Lastly, could it be believed that the Spaniards, with so great an extent of coast, were dependent on foreigners for all the dry or salt fish which they consume. A Spanish author calculates that the money given every year for imports, in that single article, exceeds L.500,000; thus the consumption in the interior nearly counterbalances all the profits it derives from the fecundity of the soil.

The insignificance of their foreign trade ought chiefly to be attributed to the indifference of the Spaniards. Although from their situation, few nations have such facilities in forming a mercantile navy, still the Spanish flag is the one which mariners observe very rarely on the sea. The Spaniards hold some intercourse with different ports in the Mediterranean, but with few in the Baltic; if they cross the Atlantic, it is only on account of their American possessions.^l

The taxes with which the products of agriculture and industry are loaded, the diversity of weights, measures and money, the bad state of the roads, and the scarcity of canals, of which the most useful remain unfinished, may be considered the principal causes which have led to the decay of Spanish commerce. But all those evils might be easily remedied, and the country contains within itself the elements of prosperity. The time may come when government, aware of the true interests of Spain, will pursue an opposite course to that which has been hitherto followed. If industry were encouraged, if salutary reforms were introduced, and if the real advantages of the country were no longer sacrificed to the imaginary advantages of American possessions, Spain might become one of the wealthiest and most flourishing regions in Europe.

^a For the details of these proceedings, disgraceful to a civilized nation, the reader may consult the work of Cambassède.

^b "—16 towns of from 3000 to 6000 inhabitants."

^c James, king of Majorca, Minorca, and Ivica, son of James I. king of Arragon, who conquered these islands from the Moors. James II. king of Arragon, was the son of his elder brother, Peter III. of Arragon.—P.

^d "The handkerchief used as a headdress by the women, is open before and thrown back upon the shoulders; in other respects it does not differ from that in Ivica." The headdress, called *rebozello*, consists of a double handkerchief, the top of which covers the head, and is tied

under the chin; then extending over the shoulders, and falling half way down the back, the two ends meet, cross and tie before. (Ed. Encyc.)—P.

^l These being now lost to the mother country, except the islands of Cuba and Porto Rico, its American trade must of course be greatly restricted.—P.

It may be necessary to mention a small territory on the confines of France and Spain, nominally neutral and protected by these two great states. Although the republic of Andorra is twice as large as that of San Marino in Italy, the former remains unnoticed,^a while the other is described in most geographical works. It occupies a valley in the Pyrenees, and is bounded on the east, the south and the west by the corregidories^b of Puycerda and Talarn in Catalonia, and on the north by the department of the Arriege. The whole territory is about seven leagues in length by six in breadth; it contains thirty-four villages or hamlets, and is divided into six communities, namely, Old Andorra, the capital, Canillo, Encamp, Massana, Ordino and St. Julian. The thermal springs near the hamlet of Caldes are still frequented, and the iron in the territory furnishes employment to many of the inhabitants.^c The valley, watered by several streams, of which the three largest are the Balira, the Ordino and the Os, is crowned by inaccessible mountains. Rich in the products of the three natural kingdoms, it contains quarries of fine marble, inexhaustible iron mines and

^a It holds a place, however, in the excellent work entitled: *Tableau de la Balance politique du Globe*, by Ad. Balbi.

^b *Corregimientos*.

valuable timber, which is transported by the Balira and the Segre to Tortosa, and from thence to the Mediterranean. The forests and the mountains abound with game and different animals, such as wild goats and wild boars, bears and wolves. Part of the land produces excellent tobacco.

Louis the Debonnaire ceded the sovereignty of Andorra to the bishops of Urgel; the latter possessed it jointly with the counts of Foix from the thirteenth century until the accession of Henry the Fourth to the throne, when the county of Foix was united to France. From that time the French kings retained feudal rights over it; but in the year 1790, these rights were abolished, and the small republic of Andorra was rendered independent of France.

The government is composed of two syndics, elected by a general council of twenty-four members, who are chosen for life by the six communities. The people speak the Catalonian dialect, and are under the spiritual authority of the bishop of Urgel. Happy in their seclusion, the quarrels of ambitious men never disturb their peaceful labours.

^c "There are thermal springs near the hamlet of Caldes, and four forges in the territory."

‡ The army consists of 65,530 men, including 4,200 guards, and is to be doubled in time of war. Hassel, Statistik, 1822.—P.

BOOK CXL.

EUROPE.

Europe continued.—France.—Historical notice.

The influence of France may be compared to that which ancient Greece possessed over the civilized world; the French language has become the language of courts and ambassadors; the literature of the same people has been admired by the enlightened of every nation; since the revolution, French philosophers have contributed, perhaps more than those of any other country, to extend the limits of science, and French armies crowned with laurels, have dictated their laws to Europe. Those, who consider philosophically certain questions by which geography may be changed into a new science, must examine the causes on which the characters that distinguish a people from neighbouring nations, depend. They cannot, in the present instance, be attributed to climate, for the extreme degrees of cold or heat, that modify the physical and moral powers of the inhabitants, are not felt in France; neither can the causes be discovered in the inequalities of the soil, for there are no extensive plains or lofty chains of mountains, which by determining men to become husbandmen or shepherds, accelerate or retard the progress of civilization. The question, therefore, depends on other causes, and its solution is not without interest in the description of a country, whose inhabitants have enlightened Europe, planted the seeds of freedom in America, and overturned empires in their political commotions.

The population of France belongs to three different races: viz. the *Celtic*, which forms nearly four fifths of the inhabitants, the *Germanic* or the people in the ancient provinces of Flanders and Alsace, and in part of Lorraine, and lastly, the *Pelasgian*, diffused over the country near the Mediterranean, and in Corsica.^a The changes occasioned by civilization may modify, but cannot wholly destroy the character of a people. It is easy to discover the French of the present day in the description of the Celts, given by Cæsar, Strabo and other writers. Although they mixed with the Franks, their conquerors, the traits by which they were distinguished, have not been effaced. The *Celtæ-Galli* or Gauls were gay, frivolous, quick of apprehension, easily excited, prompt in forming their resolutions, brave in battle, attached to their country, and jealous of their freedom. Their frankness and impetuosity are so great, adds the Greek geographer, that each man thinks it incumbent on him to resent an injury offered to his neighbour.^b They speak often of their glorious deeds, says Cæsar,^c but from their natural inconstancy, they are presumptuous after success,

and dejected after defeat. The ancients describe them as ostentatious and fond of ornaments,^d affable to strangers, and practising hospitality; according to their laws, the man who murdered a stranger, was punished with death, while he who murdered a native, was only sent into exile. At a very remote period, they elected their own magistrates, limited the authority of their princes, and never granted subsidies until they had deliberated in their popular assemblies. Their politeness distinguished them from all the people, whom the Greeks and Romans comprehended under the name of barbarians. Such are the accounts left by the ancients of the Celts, and they are in some respects still applicable to the French. Thus, too, the difference which has been observed between the same people and the other inhabitants of Europe, may be perhaps explained. The Celts were indebted to their physical constitution for the qualities which rendered them to a certain degree susceptible of perfectibility; these qualities have been transmitted from generation to generation; the soil which they occupied, and which they still possess, has been rendered more productive by their labour, and so long as the progress of improvement continues, France is likely to be the most flourishing country in Europe.

The people of the Celtic race whom the ancients called *Galli* or *Valli*, were renowned for their conquests more than seven centuries before the epoch which has been assigned to the foundation of Rome. It is unnecessary to indicate the period of their first migrations; history has preserved but a confused remembrance of them. It is known that they made several invasions into Italy, and that the Romans, while in the height of their power, employed vast armies to subdue them. Sixty years of war and carnage were hardly sufficient to reduce their country into Roman provinces, which occupied nearly the same space that the kingdom of France does at present. The glory of terminating these expeditions was reserved for Cæsar, and it is from the writings of the same person that the Romans derived their knowledge concerning the different nations in that part of Gaul which they called Transalpine (*Gallia Transalpina*). When that general entered the country, it was inhabited by three principal tribes or nations: viz. the *Celtæ* and *Aquitani*, who, although they spoke distinct dialects, belonged evidently to the Celtic race, and the *Belgæ* of Germanic extraction, who inhabited the northern part of the country. Gaul was divided into four provinces by Augustus;^e Probus subdivided it into seven,^f Diocletian into

^a This division seems to have been derived not so much from ethnographical principles as from the physical character of the inhabitants.

^d Ammianus Marcellinus, Book LXV. chap. 13.

^e Belgium (*Gallia Belgica*), Celtic Gaul (*Gallia Celtica*), Aquitaine (*Aquitania*), and the Narbonnaise (*Gallia Narbonensis*).

^f Belgium, the first and second Germany, the Lyonnaise, the Viennoise, the Narbonnaise and Aquitaine

twelve,^a Valentinian into fourteen,^b and during the reign of Gratian, the number amounted to seventeen.^c We shall enumerate the inhabitants of the fifteen provinces which made up the present territory of France.^d

The First Narbonnaise (*Narbonensis Prima*), formed by Roussillon, the greater part of the county of Foix and Conserans, was inhabited by the *Sardones*, a people probably sprung from an Illyrian colony, and by the *Volcae*, divided into the eastern and western; the former were surnamed the *Aræcomici*, their lands extended to the banks of the Rhone; the latter or the *Tectosages*, a warlike people, carried their arms into Germany, and founded Ancyra in that district of Asia Minor, which was called Galatia from its Gallic inhabitants.

The Second Narbonnaise (*Narbonensis Secunda*), which comprehended the greater part of Provence, was inhabited by the *Tricorii*, a people mentioned by Livy in his account of Hannibal's expedition, by the *Saluvii* or *Salyes*, a tribe formidable to their neighbours, and also by the *Oxybii*, who distinguished themselves in the wars against the Romans.

The Maritime Alps (*Alpes Maritimæ*) contained part of Dauphiny, Provence and Piedmont. The *Caturiges*, who inhabited that part of the province included in France, disputed with Cæsar the passage of their mountains.

Novempopulania comprehended the territory of Gascony, Armagnac, Bearn and Lower Navarre. It was peopled by the *Boii*, whom Ausonius calls *Picci*, because their country abounded with pitch or resin, by the *Ausci* who inhabited Auch, by the *Bigerrones* in Bigorre and Bearn, who covered themselves in winter with the skins of animals, and lastly, by the *Tarbelli* and the *Tarusates*, who resisted Cæsar and Crassus.

The First Aquitaine (*Aquitania Prima*) was the most important province of Gaul; in it were comprehended Quercy, Rouergue, Auvergne, Bourbonnais, Marche, Limousin, Velai with Gevaudan and another portion of Languedoc, Berry, and a part of Poitou. It was peopled by the *Cadurci*, whose principal city was Cahors, by the *Arverni* or inhabitants of Auvergne, one of the most warlike nations of the Celtic race, by the *Lemovices* or Limousins, who raised an army of ten thousand men, and by the *Bituriges Cubi*, who possessed an extensive territory long before the invasion of Cæsar.

The Second Aquitaine (*Aquitania Secunda*) comprehended a part of Poitou, Saintonge, Angoumois, Perigord, Agenois and the rest of Guienne. The inhabitants were the *Pictones* or *Pictavi*, the *Santones* in the territories of Saintes, Cognac and Angouleme, the *Petrocorii* or ancestors of the Perigourds, the *Meduli* in the country of Medoc, and the *Bituriges Vivisci* or people of Bordelais.

The Viennoise (*Viennensis*) included part of Provence together with the county of Venaissin,^e part of Dauphiny together with the principality of Orange, part of Languedoc, and part of Savoy together with the territory of Geneva. The inhabitants were the *Anatili* on both banks of the Rhone, the *Cavares* and the *Allobroges* on the right bank of the same river, the *Vocontii*, a warlike people, included by Rome in the number of her allies, and lastly, the *Helvii*.

The Great Sequanaise (*Maxima Sequanorum*) was formed

by part of Burgundy, Franche-Comté and Bassigny, together with Bresse and a portion of Switzerland. All the French part of the same province was included in the territory of the *Sequani*, from which the Romans imported their best bacon.^f

The First Lyonnaise (*Lugdunensis Prima*) was made up of Lyonnais, Beaujolais, Forez, and a part of Burgundy, Nivernais, Franche-Comté and Champagne. It was inhabited by two powerful nations, namely, the *Ambarri*, who, during the reign of the Elder Tarquin, sent colonies into Italy, and the *Ædui*, the allies of the Romans before the invasion of Gaul by Cæsar; the latter were governed by a president or elective chief, who was not permitted to leave the territory of the republic.

The Second Lyonnaise (*Lugdunensis Secunda*) comprehended Normandy, French Vexin and the greater part of Perche. It contained nine different tribes, and a resemblance still subsists between their names and the names of different parts of the country. The *Caleti* inhabited the country of Caux; the *Ebuovices*, the territory of Evreux; the *Lexovii*, that of Lizieux; the *Saii*, that of Seez; the *Bajocasses*, that of Bayeux; the *Venelli*,^g that of Valogne; the *Abrincata*,^h that of Avranches; the *Viducasses*, the city of Vieux, now a small village near Caen; and the *Veliocasses*, Vexin.

The people of the Third Lyonnaise (*Lugdunensis Tertia*), were the *Redones* in the territory of Rennes, the *Veneti* in that of Vannes, a wealthy and commercial people, the *Namnetes* in that of Nantes, the *Arvi* on the banks of the Arve, a feeder of the Sarthe, the *Cenomani* in the country round Mans, the *Andecavi* in the territory of Angers, and the *Turones* in that of Tours. Thus it appears that the province was made up of Brittany, Maine, Anjou and Touraine.

As to the Fourth Lyonnaise (*Lugdunensis Quarta*), six different tribes were settled in Beauce, the Isle of France, Brie, a part of Champagne, Burgundy and Nivernais, and in Gatinais and Orleanais; these tribes were the *Carnutes* in Chartrain,ⁱ the *Parisii* round Paris, the *Meldi* in the territory of Meaux, the *Tricasses* in the neighbourhood of Troyes, the *Senones* who inhabited Sens and Auxerre, and sent armed colonies into Italy, and lastly, the *Aureliani* in the territory of Orleans.

The First Belgium (*Belgica Prima*) was formed by the dutchy of Luxemburg, and by part of the territory of Treves and the province of Gelders. It was partly inhabited by the *Treveri*, a people that have been already mentioned, and by the *Caresi*, of whom some account shall be given in the description of the Netherlands. The people in the French part of the province were the *Mediomatrici* who inhabited Messin,^k the *Verodunenses* in the country round Verdun, and the *Leuci* who possessed a considerable territory, including Bar, Toul and part of Lorraine.

The different tribes that occupied the Second Belgium (*Belgica Secunda*,) were the brave and proud *Nervi*, who inhabited Hainault, Cambresis, and part of the Netherlands; the *Morini*, an industrious people, who carried on a trade in linen, and who occupied part of Picardy and French Flanders; the *Atrebates*, whose name has some analogy with that of Artois; the *Ambiani* in the territory of Amiens, who

^a The first and second Belgium, the first and second Germany, the Great Sequanaise, the first and second Lyonnaise, the Narbonnaise, the Viennoise and Aquitaine, to which were added, the Greek Alps, comprehending part of Switzerland and Savoy, and the Maritime Alps, including part of Provence and the county of Nice.

^b By the subdivision of Aquitaine into three parts, namely, the first and second Aquitaine and Novempopulania.

^c By the division of the two Lyonnaise into four, and of the Narbonnaise into two.

^d The Greek Alps formed a part of Savoy; the second Germany will be described in the account of the Netherlands.

ⁱ "Le Pays Chartrain," the country of Chartres.

^k "Le Pays Messin," the country of Metz.

were renowned for their cavalry; the *Bellovaci*, who were settled in Beauvaisis; the *Silvanectes*, who possessed Valois or the country round Senlis; the *Suessiones*, a powerful people in Soissonnais and part of Champagne; the *Remi*, who inhabited the territory of Reims and Laon; and the *Catalauni*, who occupied the country round Chalons.

The First Germany (*Germania Prima*) extended along both banks of the Rhine; beyond the limits of the French part of the province, it was peopled by the *Treveri*, the *Nemetes*, the *Vangiones* and the *Tribocci*, which have been already mentioned in the account of the Bavarian circle of the Rhine; but part of the *Tribocci* were settled in the neighbourhood of Strasburg and Saverne, while the *Rauraci*, the allies of the Helvetii, inhabited the districts round Neuf-Brisach.

Different dialects were spoken by the tribes or nations that made up the Celtic race. Some persons amongst them, more learned than the rest, appear to have been acquainted with the Greek characters; it is probable, however, that the Veneti and other tribes called *Armorican*, because they lived near the sea,^a adopted the written characters of the Phœnicians in consequence of their commercial intercourse with that people. As to the Irish Celts, it is supposed that they made use of distinct characters. The only Celtic languages yet remaining, are the Gaelic still spoken in several parts of the British islands,^b and which is divided into several branches or dialects;^c the Cambrian^d or Celto-Belgic, traces of which may be discovered in Flanders and the kingdom of the Netherlands; and lastly, the *Breyzad* or Low Breton, spoken by the peasants in Brittany, of which there are not fewer than four dialects, namely, the *Leonard*, used in the neighbourhood of St. Pol de Leon, the *Treconian*^e spoken by the people of Treguier, the *Cornish*^f in the territory of Quimper Corentin, and the *Vannetan*^g in the territory of Vannes.^h

Celtic Gaul formed a vast federative state, consisting of petty republics, in which the governments were of two different classes; in some the chiefs were elected for a limited period; in others the office was held during life, and these magistrates assumed the name of kings. Matters of the greatest importance, and questions concerning peace or war, were agitated in the general assemblies formed by the deputies from these republics. The time in which they were held, was the beginning of spring, and every free man was obliged to repair to them, for it was the season not only of the most important civil, but of the most solemn religious festival. "In their assemblies," says Strabo,ⁱ "the Gauls observe a custom which is peculiar to them; if any one interrupts the person who is speaking, the usher of the assembly, holding a naked sword in his hand, orders him to be silent; if he continues, the orders are repeated a second and a third time, but if he still persists, his mantle is rent in several places."^k According to a Greek poet and geographer,^l a band of musicians assisted in their councils, and when the tumult of the speakers interrupted the deliberations, it was the business of the band to play such music as was likely to have some effect in allaying the passions.

^a From the Breton word *Armorik*, compounded of the preposition *ar*, on or above, and *morik*, a diminutive of *mor*, which signifies the sea.

^g "*Vanneteux*."

In the earliest ages, the people of the Celtic race were divided into many wandering tribes; at a later period they became stationary, but the desire of liberty made them avoid the enclosure of cities; their towns always open, consisted of cottages separated by gardens, and situated on the skirts of a wood, or the banks of a river. Agriculture was reserved for the slaves of both sexes; freemen devoted themselves exclusively to the profession of arms, and like the present Swiss, when they could not find employment in their own country, they enlisted in the service of a foreigner. They reared a great number of oxen, horses and sheep, and they lived on the milk and flesh of their cattle, and the produce of the chase. If Pliny may be believed, the same people, who adopted so readily the usages of civilized life, were *anthropophagi* before the arrival of the Romans in Gaul. The skulls of their enemies slain in battle, were girt with gold or silver, and served as drinking cups in their banquets; wine, hydromel, and beer sparkled on the board; they passed from one person to another, but they were never offered to the ignoble, or in other words, to those who had not distinguished themselves in an engagement, for in early times, among the Celts, as well as among every other barbarous people, titles of nobility were only granted to such as had shed the blood of their fellow-creatures. It has been said that the custom of duels was introduced into the country by the Franks; but the honour which the Celts attached to the profession of arms in the remotest ages, established amongst them the right of appeal to the sword, and a Celt was disgraced by refusing a challenge. A freeman was never seen in public without his arms, hence, without doubt, the custom, which the revolution has modified, of wearing a sword at the court and on occasions of ceremony. Long hair was considered a great ornament by both sexes; they stained their fair hair of a red colour by means of a particular unguent, in the same manner as their descendants render the hair white by the use of powder. The men wore long chains of gold round their necks, and loaded their arms and wrists with bracelets of the same metal. They rubbed their face with butter to make it shining, and the women used the foam of beer for the same purpose.

Polygamy was not permitted by the Celts. When a girl was marriageable, her parents invited all her suitors to a feast, and the first to whom she presented the washing vessel, was the person of her choice. In the marriage ceremony it was customary for the bride to address her husband in the following manner—You are my master and my husband; I am your servant. The husband had the power of life and death over her, and if a wife was convicted of having killed her husband, she was burned alive.^m Adultery was severely punished, and divorce was sanctioned by law. Public assemblies, marriages and funerals were so many occasions for sumptuous repasts, which usually terminated in dancing.

The Celts had no temples; they thought the greatness of the divine power, accorded ill with the smallness of human buildings; it was in the forests that they offered up their prayers to heaven; they there placed shapeless stones

^h There are only twenty-two letters in the *Breyzad*; among them may be remarked the nasal *n*, the *j*, the *ch* and the liquid *l* of the French, and the German *ch*. See the *Atlas Ethnographique* by Adrian Balbi.

near each other, so as to enclose a sort of sanctuary, or they erected a huge and isolated stone, around which their religious meetings were held. Although, according to Cæsar, they worshipped the same gods as the Romans, it is certain they considered it impious to represent the divinity under the form of a man. The isolated stones, called *menhirs* and *peulvans*, or a lofty and venerable oak, were the symbols which they adored. They admitted an infinite intelligence, the first cause of the harmony that prevails in the universe. *Teut* or *Teutates*, the Celtic Mercury, and the creator of the world; *Esus*, or their Mars; *Kernunos*, or their Bacchus; *Ogmios*, or their Hercules; and *Belen*, *Woden* and their other gods, were only secondary divinities. They rendered besides a sort of religious homage to the four elements, to springs, fountains and rivers, and to the sun and the moon. It was by the light of the moon that the priests made the multitude assemble in their ancient forests or in other places that excited the mind to superstition. Their priests were divided into different classes. The *Eubages* studied and interpreted nature;^a the bards or *Saronidæ* cultivated poetry, that their laws might be more readily committed to memory by the people; they also sung the exploits of heroes, and transmitted the history of great events to posterity; the *Vates* sacrificed the victims, and the druids were the sages who predicted futurity after examining the entrails.^b The latter, skilled in casuistry, directed the people in matters of conscience; versed in all the sciences, it was supposed they could cure all diseases. They administered justice, and they presided in the assemblies of the nation, and at the judicial trials called the judgments of God, in which the proofs by fire, iron and water, determined the guilt or innocence of the accused. In short, they possessed so much credit that no affair of any consequence, relative to public or domestic policy, could be undertaken without their advice. They led the people into the belief that guilty actions and sins offended the divinity, and that expiatory sacrifices were necessary to deliver the soul from impending wrath; hence the great number of animals, which were slain; but as man is the noblest of animals, they thought human blood most acceptable to the gods. The victims were generally chosen among the prisoners of war; but on occasions of public calamity, fanatics offered themselves voluntarily to be sacrificed, and died contented in leaving behind them an example of devotedness, and a great reputation for piety. The Celtic clergy made use of their religion to inculcate the practice of moral duties; they affirmed that the gates of paradise were closed against those who died by their own hands; thus suicides were numbered among the acts of the wicked. He who outraged public morals, was liable to be excommunicated, by which he was prevented from mixing in civil or religious assemblies, and was regarded as an object of abhorrence by his fellow citizens. The druids established fasts for political purposes; they enjoined their disciples to abstain from animal food in the middle of summer, because in that season of the year, vegetables were considered more wholesome.

The oak was held in veneration by the Celts, and the mistletoe, which is so seldom seen on the same tree, was probably for that very reason consecrated to the divinity. It was a sovereign remedy for every evil, and the water in which it was infused, rendered sterile animals fruitful.^c The

year was divided into lunar months, and on the first day of every year, the druids forming an imposing band, marched through the forests, cut the parasitical plant with a golden knife, collected it in a white *sagum* or tunic, and distributed it afterwards to the eager multitude. The ceremony was announced by the priests, who travelled through the country and summoned the inhabitants by repeating with a loud voice,—*aguillaneuf*;^d an exclamation which is still known in some of the provinces.

The druids acknowledged a chief to whom they submitted in all things, and who resided in Chartrain. None were admitted to the sacerdotal office until after a noviciate of twenty years. Their wives shared the veneration in which their husbands were held by the people; they were the judges of family quarrels, and their decisions could not be revoked; in the art of predicting futurity, they acquired a greater celebrity than the men; hence perhaps the origin of the popular superstitions concerning fairies, so long believed in different countries in Europe.

The Romans, aware of the advantages they might derive from the courage of the Celts, respected their municipal privileges; they were anxious, however, to civilize them, which was easily done by making them adopt their arts and laws. Provincial governments and the title of Roman citizen were conferred on the chiefs. The Celtic language was mixed with the Latin, particularly in central Gaul, which served as a communication with Germany; but it was necessary to deliver the people from the yoke of the druids. Cæsar,^e Tiberius^f and Claudius^g employed alternately persuasion and force to abolish the horrid practice of immolating human victims. The forests were destroyed; the people in time repaired to temples, and altars were erected to the gods of the *Capitol*. The religion of the conquerors was mingled with the ancient worship of the druids; and druidesses resided in the temples, where they officiated as priestesses, but they were permitted to remain one day in the year with their husbands,—a privilege they enjoyed while their ancient faith was in its purity; other persons who had taken vows of celibacy, performed in Gaul the offices of vestal virgins.

But druidism was not wholly abolished when the conquerors and the conquered embraced Christianity. It is probable that the first Christians who converted the Celts, sanctioned certain practices which might contribute to the benign influence of Christianity on a superstitious people; the same practices were approved by Rome, and adopted afterwards in different countries. The Christians had no difficulty in considering the druids magicians or men under the power of the devil; the persecuted priests and their persecuted partisans were unable to resist the zeal and knowledge of the new proselytes.

Half a century had hardly elapsed, after the Roman power had been divided into the western and eastern empires, when the Roman provinces were dismembered by the barbarous nations, that had been too long oppressed by the rulers of the world. The Burgundians and other people of the same origin, known by the name of Visigoths, founded about the beginning of the fifth century two contiguous kingdoms in the heart of Gaul. The former besides a part of Switzerland and Savoy, possessed Franche-Comté, Bresse, Dauphiny, Lyonnais, the greater portion of Nivernais, and the

adjoining country, which from these inhabitants has been called Burgundy. The banks of the Loire were the northern limits of the Visigoths; they ruled over the centre and the south of France, including Provence, the county of Nice, and even a part of Spain.^a Numerous hordes that issued from Germany, settled in the Netherlands; they founded some years afterwards, under the command of Pharamond, a petty kingdom, of which the southern limit may be represented by a line drawn from the mouth of the Somme through Amiens and Rethel, including Treves with part of its territory, and terminating on the left bank of the Rhine, a short way below Mayence.^b Sixty years afterwards, the same Franks, under the conduct of king Clodovech or Clovis, destroyed the remains of the Roman power in Gaul, and made themselves masters of all the country between the last mentioned boundary and the limits of the Visigothic and Burgundian kingdoms. At a later period, they crossed the Rhine, extended their conquests into Germany, and left colonies in that part of the country which has been since called Franconia.

Gaul was thus divided during twenty years; a third part of the surface was occupied by the Franks, rather the protectors than the oppressors of the Gauls, who were confounded with the Romans, because they had adopted their manners and laws. The victors were distinguished by their appearance, their language and their dress. The Franks wore short boots; the arms and the rest of the leg were bare; the body was covered with a narrow and short tunic, bound by a girdle; their long and fair hair descended below their shoulders.^c Their weapons were a long sword, a *francisca* or two-edged hatchet,^d several javelins divided near the extremity into three branches, representing what the French have since termed a *fleur de lys*, and lastly, a small buckler which they used with great address. The chiefs abolished most of the imposts; they allowed the ancient inhabitants to retain their customs and magistrates, reserving to themselves the right of appointing dukes over the provinces, counts over the towns, and viscounts over the burghs and villages; but, in the councils of the prince, the Gauls preserved that credit and ascendancy, which are the consequences of superior knowledge.^e The proprietors were compelled to share their land with the invaders, but the peasants and the working classes remained in a state of slavery. The slaves of the king were distinguished from the slaves of the Franks and the Gauls; among the latter, many possessed slaves, because the Gallic nobility had been preserved. The Burgundians and the Goths, more barbarous than the Franks, clothed themselves with the skins of wild beasts. The first might be discovered by a round visage, small and sunk eyes, broad shoulders and a deep chest. The second were distinguished by a darker complexion, aquiline nose, lively eyes, full black beard, and long plaited hair.^f Their barbarity or rudeness rendered the Gauls impatient of their yoke, and the same cause contributed, in a great degree, to the destruction of their monarchies. The ambition of Clovis soon reduced the Visigoths to the necessity of migrating into Spain. After the death of that prince, his sons divided France into four kingdoms, of which Paris, Orleans, Soissons

and Metz, were the capitals. Additional territory was afterwards acquired, and by succession, conquest, usurpation, or in consequence of murders and other crimes, the different parts of France and the kingdom of Burgundy were united in the seventh century under a single head. A century afterwards, France was governed during some years by Charlemagne and his brother Carloman, but the first became sole master, and rendered it powerful by his conquests.

France has never been so extensive and powerful as it was under Charlemagne; it was then divided into two parts, the western and the eastern. The first comprehended Provence, *Gothia* or *Septimania*, now Languedoc, *Vasconia* or Gascony, Aquitaine, *Burgundia* or Burgundy, *Neustria*, including Brittany, Normandy and Flanders, and lastly *Austrasia*, formed by all the country situated between the mouth of the Rhine and Jura. The countries on the south and on the north of the Alps, and the territory extending from the right bank of the Rhine to the mountains of Bohemia, and the banks of the Elbe, made up eastern France. In other words, Charlemagne reigned over the greater part of Italy, and over Switzerland, Bavaria, Hesse, Saxony and Friesland. In the countries extending between the banks of the Drave and the Danube, and those of the Elbe, several nations were also tributary to the same monarch.

The weight of such an empire was too great for his successor. Louis the Debonnaire, a weak father and a feeble prince, spent his time in contending against his revolted children, and died after having divided amongst them a crown which he was unworthy to wear. France was governed during a century by the princes of the same race, but the kingly power was weakened by the abuses of the feudal system; and when Hugh Capet took possession of the throne in the year 987, he was merely the first baron in the kingdom, and reigned only over Picardy, the Isle of France and Orleanais. The policy of that prince and his successors was to increase the power of the crown by humbling and degrading the nobility. Berry was purchased in 1100 by Philip the First from the viscount Eudes Arpin; and king John erected it into a duchy, which became the appanage of one of the sons of France. Louis the Gross made no acquisitions or conquests, but by liberating the towns,^g he raised a barrier against the encroachments of the feudal lords. In 1202, Philip Augustus wrested Touraine from John, king of England,^h who had succeeded to it as the descendant of its counts; and in the following year, the same Philip made himself master of Normandy, which, from the time of Charles the Simple, had been ceded in perpetuity to Rollo and his Norwegians. Amaury de Montfort gave up Languedoc to Louis the Eighth, and the cession was ratified by a treaty made with St. Louis in 1228. Jane of Navarre, by her marriage with Philip the Fair in 1284, united the county of Champagne, which she had received as her dowry, to the dominions of her husband. In 1307, the inhabitants of Lyonnais having gained their freedom, compelled their archbishop to acknowledge the authority of the same king.

Dauphiny, which derived its name from Guy the Eighth,

^a The kingdom of the Visigoths was founded by Ataulphus in 411, and that of the Burgundians by Gunderic in 413.

^b It is generally admitted that the kingdom of the Franks was founded in the year 420.

the bravest of his princes, surnamed the Dauphin, because he wore on his helmet the figure of a dolphin, was ceded to Philip of Valois in 1349, on condition that the eldest sons of the French kings should assume the title of Dauphins, and also that the country should form a separate sovereignty, and never be incorporated with the kingdom. Charles the Fifth took Poitou, Aunis, Saintonge and Limousin from the English. Charles the Seventh, in consequence of his victories over the English, added to his dominions, in 1453, the greater part of Guienne and Gascony. Louis the Eleventh humbled the power of the great, and had the good fortune to acquire Maine and Anjou by inheritance, conquests made by Philip Augustus, but more than once detached from the crown, and conferred on princes of the blood. The same monarch seized the duchy of Burgundy, declaring himself the lawful heir, although there existed at the time a duke of Burgundy, Nevers and Rethel. It was stated however in letters patent, that the duchy had been united to France with the free will of the states on the following conditions, namely, that the people were not to be deprived of their natural judges, that no subsidy was to be imposed without the consent of the three orders, and that the taxes, which the people had hitherto paid on wine and the other products of the province, were to be abolished. The same king took possession of Provence, having proved by several witnesses that Charles of Anjou had made him his heir. The inhabitants received the same privileges as those which had been granted to Burgundy. Since that period, the French kings have on several occasions styled themselves counts of Provence. Francis the First availed himself of the rights which he had acquired by the revolt of the Constable Bourbon, and in 1527 obtained Auvergne, Bourbonnais and Marche, which belonged to the prince. Some years afterwards, Brittany, of which the inheritance had devolved on his son Francis, was united to the kingdom. In consequence of this junction, Brittany was exempt under his successors from most taxes, being merely subject to a voluntary impost voted by its states. The same gallant and chivalrous king was a poet and friend of the fine arts; flattery has designated him as the protector of letters, although he established the censorship; he was not considered cruel, although by his presence he added the weight of his authority to the punishments of the inquisition. In the same reign the assemblies of the notables were substituted for the states-general,^b but the crown derived little advantage from the change, for notions of civil and religious liberty were then gaining force; they proved the harbingers of political commotions, and served as instruments for the ambitious and discontented to excite the people.

The corruption of the court and nobility under Henry the Second, Francis the Second and Charles the Ninth, were favourable to the reformation. The principles of the new religion accorded well with the growing desire for knowledge, but the question became a political one, and the royal party confounded the reformers and their partisans with the opponents of absolute power. The massacre of St. Bartholomew, considered an act of political wisdom by Catharine de Medicis and her son, was devised and executed to rid royalty of its enemies. But the designs of the League

^a "In their letters addressed to the province."

^b The States-general consisted of deputies chosen by the three estates, namely, the nobility, the clergy, and the people. The assemblies of the Notables were formed by a number of persons from all parts of the kingdom, chiefly selected from the higher orders of the state by the king himself. Ed. Encyc.—P.

assumed a very different appearance during the reign of Henry the Third, for it appeared to be the chief object of the party to put the crown of France on the head of a Spanish prince. Henry the Fourth, whom the catholic chiefs held in execration, ascended the throne, and added to the kingdom all that then remained of the dominions of his fathers, or Bearn, the county of Foix and part of Gascony. France during the reign of Louis the Thirteenth was twice agitated by civil wars; but the policy of Richelieu saved the kingdom, and his master gained new laurels by the conquest of Artois in 1640, and of Roussillon in 1642.

The reign of Louis the Fourteenth contributed to the aggrandisement of France; that monarch obtained Nivernais by the total extinction of the feudal system; he took Flanders by conquest in 1667, and some years afterwards made himself master of Franche-Comté; lastly, by a treaty with the emperor of Germany in 1697, the cession of Alsace was ratified. Under Louis the Fifteenth, Lorraine, formerly a portion of the states belonging to Lothaire,^c of whom it bears the name, was added to the kingdom; it was shortly afterwards ceded to Stanislaus, king of Poland,^d on condition that it should be restored to the crown after his death, an event which happened in 1766. The republic of Genoa gave up Corsica for a sum of money two years afterwards.

Such were the extent and importance of the French territory, during the latter part of the long and peaceful reign of Louis the Fifteenth; and the king, whose death was not regretted by the nation, left to his successor the difficult task of realizing the expectations which his virtues seemed to promise. The well informed classes were able to appreciate the institutions which they desired, and the king consented to adopt them. But it was necessary to introduce reforms into the finances, and the middling classes were more jealous than ever of the privileges of the nobility. The states-general were no sooner convoked than their respective interests gave rise to two parties; the deputies of the third estate, full of confidence in public opinion, swore never to separate until they had framed a constitution. It was accepted by Louis the Sixteenth, and the pope ceded Avignon and the county of Venaisin to France. The kingdom having been divided into eighty-three departments, the assembly was dissolved.

It was succeeded by the legislative assembly, composed of men who did not understand the advantages of a representative system, and who allowed themselves to be ruled by a party. The acts of the sovereign were purposely misrepresented, and the people dreamed of a republic. A new era soon commenced, marked by a political fanaticism, of which history affords no other example, and by crimes, of which the recital fills the mind with horror. Louis the Sixteenth yielded to the storm, and died with the resignation and tranquillity of a virtuous man. France was shortly afterwards governed by a handful of persons, who, under the name of equality, divided the inhabitants into classes, under the name of liberty, established the most sanguinary despotism, under the name of fraternity, sought associates among the dregs of the people, and under the name of reason, abolished Christianity, and substituted the ceremonies of pagan mythology. Anarchy reigned within, but France repelled

^c Grandson of Louis the Debonnaire. The country was first called *Regnum Lotharii*, then *Lotharingia*, afterwards *Loherrene*, *Lorraine*, and lastly *Lorraine*.

^d Lorraine, which had been previously considered as a duchy belonging to the empire of Germany, was conquered by the French in 1733, and in 1736 ceded to Stanislaus, king of Poland.—P.

foreign armies, while the different parties in the national convention, proscribed, banished and massacred each other. The government was overturned, and the management of affairs committed to two councils and five directors; if they possessed great influence, both abroad and at home, it was owing to the victories of the French. The principality of Montbelliard was united to the republic in 1796, and the free territory of Mulhausen in 1798. But after the directory had existed five years, it was destroyed by the efforts of a few, at the head of whom was the young general, who had distinguished himself in Italy and on the plains of Egypt. Bonaparte was named first consul; he put an end to factions, acquired new glory in Italy, and dictated conditions of peace to the emperor of Germany.

The treaty signed at Luneville on the ninth of February 1801, confirmed France in the possession of additional conquests. The course of the Rhine from Wissemburg to the place where it is called the Waal, served as a limit to the republic, and beyond the same point, Belgium, Antwerp and Flushing were included within the northern frontiers. The same rich territory formed the twelve departments of Mont-Tonnerre, the Sarre, Forêts,^a the Rhine and Moselle, the Sambre and Meuse, the Ourthe, the Roer, the Lower Meuse, Jemappes, the Dyle, Deux-Nethes^b and the Scheldt. Porentruy on the east of the ancient boundaries was united to the department of the Upper Rhine. The country round Geneva and Chambéry formed the departments of Lemnan and Mont-Blanc, and the county of Nice was changed into the department of the Maritime Alps. By the treaty of Amiens, peace was restored to Europe on the twenty-seventh of March in the following year, and England gave up the French colonies which she had seized during the preceding wars.

In the year 1804, Napoleon converted the laurels of Montenotte, Arcole, Rivoli and Marengo, into an imperial diadem, and received in Paris, from the hand of the sovereign pontiff, the unction with which kings are consecrated, and, as if to heighten the splendour of a title, which added nothing to his glory or his power, the anniversary of his coronation, in the following year, was the day in which he gained a very memorable victory, by defeating the Austrian and Russian armies on the plains of Austerlitz; the treaty of Presburg was the result of the campaign, and by that treaty Prussia ceded to Napoleon all its rights to the dutchy of Cleves, together with the country of Neufchatel and Vallengin and the territory of Anspach, the last of which was exchanged for the dutchy of Berg with Bavaria, which was at the same time erected into a kingdom. The emperor of Austria gave up Dalmatia and the Venetian states, and relinquished to him the title of king of Italy. Piedmont and Liguria were added to France, and changed into the departments of the Doria, the Sesia, Marengo, the Po, the Stura and Montenotte.

The importance of the empire was still farther increased, when its chief became the protector of the German and

Swiss confederations. A new rupture, followed by new victories, changed again the state of Europe; the battles of Jena and Friedland brought about the treaty of Tilsit,^c in consequence of which the confederation of the Rhine was more than doubled in importance, and France obtained possession of the Ionian islands. In the following years, Kehl, Cassel and Wesel on the right bank of the Rhine were added to the departments on the left, and the grand dutchy of Tuscany, the dutchies of Parma and Placentia, the territories of Spoleto and Rome, the Valais, Holland, Friesland, Hanover, the bishoprick of Munster, the county of Oldenburg, and the possessions attached to the free towns of Bremen, Hamburg and Lubeck, were transformed into French departments.

Napoleon ruled over the greater part of Europe; when emperor, he changed kingdoms into republics, and when emperor, republics were changed into kingdoms; he founded monarchies in Germany; twice he spared the crown of Prussia, but lavished the best blood and the treasures of the empire to place his brother on the throne of Spain. Having lost the best army in the world on the frozen plains of Russia, and been abandoned by his allies on the field of battle, he made a glorious resistance in France against the combined efforts of Europe. On the 31st of March 1814, his capital was occupied by the foreigners whom he had often vanquished. Compelled to abdicate, he retired to the island of Elba, leaving to the ancient family of the Bourbons a kingdom which had been confined by treaties within its former limits. The territories of Montbelliard and Mulhausen were all that France retained of her republican conquests.

The institutions, for which the French were indebted to the wisdom of Louis the Eighteenth, made them forget the disgrace of a foreign occupation, but the reports of the disaffected were believed and circulated through every part of the kingdom; Napoleon, availing himself of the general discontent, landed at Frejus on the 1st of March 1815, and entered Paris along with the troops that were sent to take him prisoner. He immediately levied an army to oppose the attempts of foreign princes, gained the victory of Ligny, and was defeated the next day on the plains of Waterloo.^d Having abdicated in favour of his son, he entrusted himself to the generosity of the English government; and the man who at one time thought the world too small for his ambition, was banished to an arid and volcanic rock in the midst of the ocean.

France lost a territory of twenty square leagues in extent, which had been fortified by Louis the Fourteenth;^e it paid to the foreigners whom it maintained during five years, an indemnity of 700,000,000 francs, or nearly L.29,200,000; yet by means of a good government and wise institutions, it has recovered from its calamities, and resumed the rank which it held among the kingdoms of Europe.^f

According to its present limits, France extends from seven degrees nine minutes, to the west of the meridian of Paris, to five degrees fifty-six minutes, to the east of the same

popular basis, and its nearer adaptation to the principles of liberty. The form of monarchy is retained, but its principle may be considered as essentially abandoned. The king no longer rules by his own right, but by the will of the people; he is no longer a sovereign *jure divino*, but a citizen king, holding his power from a grant of the national representatives. So the charter is no longer a gift of the king to the people, but a constitution established by the latter, and simply sworn to by the king. These are great points gained; and if France confines herself to her own internal consolidation and improvement, and can avoid the encroachments of administrative power on the one hand, and the tumults of popular anarchy on the other, she may become what England has been, in theory, since the revolution of 1688,—a monarchical republic.—P. (Dec. 1830.)

^a "Les Forêts"—The department of the Forests, including the greater part of the grand dutchy of Luxemburg.—P.

^b The Two Nethe—so called from two small rivers of that name (the Great and the Little Nethe) in the territory of Antwerp.

^c It was signed on the 7th of July 1807.

^d The battle of Ligny was fought on the 16th of June, and that of Waterloo on the 18th.—P.

^e The territory of Saar-Louis, annexed to the Rhenish possessions of Prussia.—P.

^f The recent revolution (July 27-29, 1830) has given a new turn to affairs in France. The immediate effects of the revolution have been the change of dynasty from the elder branch of the Bourbons to the branch of Orleans, the establishment of the charter on a new and

meridian, and from forty-two degrees twenty minutes to fifty-one degrees five minutes of north latitude. It is bounded on the north by a part of the Channel and the Straits of Calais, the kingdom of the Netherlands, the grand dutchy of Luxemburg, the Prussian provinces on the Lower Rhine, and the Bavarian circle of the Rhine; on the east by the grand dutchy of Baden, Switzerland and the Sardinian States; on the south by the Mediterranean and Spain; and on the west by the Atlantic ocean and a different part of the Channel.

The greatest dimensions of its frontiers may be determined by two lines, the one drawn in the direction of north-west to south-east from the most western point on the coast of Brest to Antibes, forming an extent of $239\frac{1}{2}$ leagues,^a and the other drawn from Givet in the Ardennes to Mount Huromba in the Pyrenees, to the south-east of St. Jean Pied de Port, being about 208 leagues in length. The greatest breadth of the kingdom is about 206 leagues from Kersaint in the department of Finisterre to the confluence of the Lauter and the Rhine in the department of the Lower Rhine. The extent of the coasts, including their sinuosities, has been calculated at 490 leagues.^b The total superficies, including that of Corsica, amounts to 26,739 square leagues. The population about the beginning of the year 1827, was equal to 31,820,000 souls, or on an average to more than 1191 individuals for every square league. Although the population has considerably increased since the revolution, for in the year 1790, the same surface contained only about 25,000,000 inhabitants, and, in 1814, the period of the restoration, 28,500,000, it is not less certain that France might be much more populous. Thus if two departments be taken, forming nearly the two extremes, namely, that of the North which contains 3,403 inhabitants for every square league, and that of the Lower Alps, which contains only 415, the mean term would be 1714 individuals, and if such were the average number of inhabitants for every square league in the kingdom, the total population of France would amount to 45,000,000. The fruitfulness of the soil cannot be denied, but before so great a number of inhabitants can be maintained, agriculture must be much improved, the different branches of industry must be extended, and new sources of wealth created.

Corsica, the third largest island in the Mediterranean, possesses within itself the elements of prosperity which may one day render it the finest of the French colonies. It is equal in surface to 495 geographical square leagues.^c

The history of the island from the remotest ages to the period when it was united to France, forms only a distressing picture of war, bloodshed and revolt. Herodotus affirms that it was first inhabited by the Phœnicians, who gave it the name of *Collista*; before that period it was called *The-*

^a Twenty-five of these leagues are equal to a degree.

^b Their extent, exclusively and inclusively of their sinuosities, may be seen by the following table:

	Straight line.	Sinuosities.
Coasts of the Mediterranean,	85 leagues.	120 leagues.
Atlantic,	145 "	195 "
Channel,	135 "	175 "
	365 "	490 "

^c It is situated between $41^{\circ} 17'$ and 43° N. lat. and between $6^{\circ} 12'$ and $7^{\circ} 12'$ E. long. from Paris.

^d Herodotus, Book IV. ch. 147.

^e There appears to be a great degree of confusion in the above passage. The passage quoted from Herodotus refers only to the island of Thera in the Archipelago. He simply states that the island took its name of Thera from Theras; that it was previously called *Collista** (not *Collista*;) and that it had been occupied by a colony of Phœnicians

* Καλλιστη.

rapne. It was afterwards peopled by a colony of Lacedæmonians or, according to Seneca, of Phocæans, who called it *Thera* from Theras, the name of their chief.^d Owing to the frequent communications between the islanders and the Greeks, it received from the latter the names of *Cyros*, *Cermeatis* and *Corsis*;^e but the Romans having taken it from the Carthaginians, styled it *Corsica*, a name of which the origin is uncertain.

The characters which the ancients have left us of the inhabitants are apparently contradictory. Strabo describes them as living by plunder, and as more savage than wild beasts. "If a Roman general," he adds, "advances into the interior, takes some forts, and brings a certain number of slaves to Rome, their ferocity and stupidity afford a singular spectacle. They consider it either not worth their while to live, or they remain in a state of complete apathy and indifference. However small the price may be for which they are sold, their masters soon discover that they have paid too much for them." But, as the annotator on Strabo^f remarks, Diodorus Siculus bears witness to the contrary. According to that writer, the Corsican slaves are the best servants of any; they are from habit singularly clean.^h Their aversion to their conquerors has tended to preserve the manners of their ancestors. They are still sober, brave, hospitable and enthusiastic in their love of freedom. They may be distinguished by lively eyes, a stature about the middle size, and a dark complexion.

Corsica was added to the dominions of the Goths after the fall of the Roman empire; but the inhabitants neither lapsed into the barbarism of their masters, nor submitted to the feudal system which they established. The effects of the conquest were battles, murders and crimes of which history has preserved a confused remembrance. The Goths were succeeded in the eighth century by the Arabs and Saracens, who remained but a short time in the island. It was reserved for the rising republic of Genoa to impose a cruel and tyrannical yoke on the people, which lasted, with many interruptions, during a period of nine centuries. In the same period the people experienced all the vicissitudes that result from resistance and submission; at one time asserting their independence, at another yielding to their oppressors. Rome attempted the conquest of the island; the Pisans took it from their rivals during the eleventh century, but in the twelfth, the latter gained it anew. In the course of the thirteenth century it was nearly taken by the Pisans, and during the fifteenth by Alphonso the Fifth, king of Arragon. Genoa ceded it in 1465, and took it back shortly afterwards from the duke of Milan. In 1553, Henry the Second assisted the Corsicans, and freed them from the Genoese; but six years after their deliverance, the island was restored to the

left by Cadmus, before it was settled by the Lacedæmonians under Theras. These statements of Herodotus are partly confirmed by Strabo. On the contrary, Seneca simply states, in which he is confirmed by Diodorus (Lib. V.), that Corsica was settled by a colony of Phocæans (Epigramm. super exilio, Ep. l. v. 1.) and that the Greeks from Phocæa who founded Marseilles first settled in the island (De Consolat. cap. 8.) He farther states in the same place, that the earlier history of the island was involved in the darkness of antiquity. *Therapne* was the name of a town in ancient Crete. (Pliny.)—P.

^f Strabo, Book V. ch. 4. § 5.

^g M. Gosselin.

^h "The Corsican slaves, says Diodorus, are better than all others for useful service, for which they are by nature peculiarly adapted." This conveys the correct sense of the Greek original, in which not a word is said of their cleanliness. "Ταδε ανθρωποτα κυρια διαφερει δοκει τωι αλλωι διωλιω εις τας κατα τον βιων χειρας, φυσικης ταυτης της ιδιοτητος παρακολουθησης."—P.

ⁱ Diodorus Siculus, Book V. § 13.

republic by the treaty of Chateau-Cambresis. Promises of assistance were offered, but never fulfilled, and the inhabitants, almost reduced to despair, had recourse to revolt in 1564. Men were not wanting, who could organise and direct insurgents, but none were found capable of liberating their country. Tranquillity was restored each time Genoa promised to abolish their grievances, but when she resumed her authority, her promises were broken. While the different parties against the Genoese were divided on the choice of their leader, a German baron, Theodore Von Neuhof, landed in the island, offered his services to the insurgents, and gained so great an ascendancy over them, that he was proclaimed king. Without talent as a general, without energy as a monarch, he was unable to disperse the Genoese, or to unite the factions which enfeebled his ephemeral kingdom. Twice he sought in foreign countries resources and supplies, which he could not find at home, and during his absence, an auxiliary army furnished to Genoa by France, put an end to the revolt. The French had hardly left the island before a new insurrection broke out, and king Theodore returned in 1741. Eight years afterwards the French

conquered Corsica, and restored it to the Genoese, but the latter found a formidable enemy in Pascal Paoli. It was not enough that he repelled the oppressors; he became the liberator and lawgiver of his country. Deputies were sent by him to the principal courts of Europe, announcing that the Corsicans, no longer submitting to the treachery of Genoa, had proclaimed their independence. The republic of Genoa ceded in 1768, the sovereignty of the island to France. The people did not confound in their hatred the Genoese and the French; many submitted voluntarily, and the independent party was annihilated after a single campaign. The efforts and genius of Paoli were employed in vain; he left his country, and found an asylum in England. An unforeseen event called him from his retirement; the French revolution having commenced, he repaired again to the island, and with the assistance of the English repelled the French. Paoli intended to found a republic, when the king of Great Britain was proclaimed sovereign of Corsica; but the inhabitants were mistrustful of the English, and an easy victory freed them from British supremacy.

BOOK CXLI.

EUROPE.

Europe continued.—Physical Geography of France.

THE different sciences of which the object is to extend our knowledge of nature, have thrown additional light on geography. Physical geography, a new department of science, possessing many attractions, has thus been created. In its application to France, it indicates the connexion of the different chains of mountains, the rivers that rise from them, the fertility or barrenness of the soil, the different windings of the coasts, the fish that are found in the seas and rivers, and the animals indigenous to the mountains and plains. The science of geology tends to illustrate physical geography; descending into the depths of the earth, it reveals the nature of the strata beneath the surface, and the mineral riches contained in them. It may be necessary, therefore, to advert to some elementary principles of geology, which are no longer contested, and to describe in a few words the formation of the different deposits comprehended within the limits of France, and the volcanic convulsions of which it has been the theatre.

The northern declivities of a part of the Pyrenees, and the western of the Alps, form a portion of the southern and eastern boundaries of the kingdom. It is obvious that the other mountains in France form, together with those last mentioned, part of the summit line, which divides Europe into two great declivities. The Pyrenees unite with the Cevennes, and the Cevennes with the Vosges, while the latter meet Jura on the south, and form the Ardennes on the north. In the present state of geographical science, in order to determine the points of junction or separation between different mountains, it is necessary to determine the nature and formation of the rocks which compose them; and as the same remark is equally applicable to their boundaries and ramifications, the study of mineralogy becomes indispensably necessary to all those who do not confine their inquiries to the systems of ancient geographers, or to political and arbitrary divisions ever liable to change.

According to this method, the mountains in the interior of France may be designated the *Franco-Celtic group*. It belongs to the vast Alpine range, and consists of two principal chains, namely, the *Ceveno-Vosgian* and the *Armorican*. The first, separated from the Pyrenees by the valley in which is situated the canal of Languedoc, is formed on the south by the Black Mountains, the Espinouse, the Garri-guen and the Cevennes proper. A branch called the Levezon stretches towards the south-west from Mount Lozere in the Cevennes, while the mountains of Aubrac extend to-

wards the north-west. In the same direction, the mountains of Margeride connect the Cevennes with the Cantal and Mont-Dor,^a the last of which includes the Puy de Saucy, the highest summit in central France. A long but not a very high chain passes from these two branches to the Loire, in which the loftiest points are Mount Olouze, Mount Jurgean^b and the heights of Gatine. A much shorter chain, situated between Mount Lozere and the Mezen,^c formed by the mountains of Forez and those of La Made, stretches northwards to the banks of the Loire. The Mezen, the Pilat,^d the mountains of Charolais, and the Cote d'Or, together with Mounts Moresot and Tasselot, the plateau of Langres, and the Faucilles, form the connecting link between the Cevennes and the Vosges. The heights of Morvan extend towards the north-west near the banks of the Ouche, and terminate in low hills at the sources of the Vernisson. The Vosges, which are separated on the south-east from the chain of Jura only by a valley now traversed by the canal of Monsieur, extend on the north to the banks of the Rhine. Branches of the same range extend towards the north-west near the sources of the Moselle, and form different ridges, covered with the thick woods of the Ardennes. They are divided anew into two other branches near the sources of the Oise, one of which terminates at the Straits of Calais, and the other near the coasts of the Channel. It appears from their geological composition and other circumstances which shall be afterwards mentioned, that the various divisions of the Cevennes and the Vosges are only different parts of a single chain.

The Armorican chain consists of four divisions, which extend in different directions. It commences on the western coasts of ancient Brittany, where it divides itself into two branches known by the names of the mountains of Arree and the Black Mountains; the former are situated on the north of the Aulne, and the latter on the south of the same river. The Menez mountains extend eastwards, and a series of hills beginning near the sources of the Vilaine, runs towards the south, and, but for the course of the Loire, would join a part of the preceding chain. The northern extremity of one branch forms Cape La Hague; another on the east stretches to the heights of Beauce, which are separated by the valley of the Vernisson from the mountains of Morvan. It is thus that the two chains may be considered as forming but a single group.

France may be divided into fifteen basins, viz. four principal basins, one German, two Belgian, and eight connected in the text, which may be considered a translation of *Mons Duranius*.

^a Mont-Dor, which Sidonius Apollinaris calls *Mons Duranius*, is generally written Mont-d'Or, as if its Latin name had been *Mons Aureus*. Ramond proposed to call it Mont-Dore, after the name of the river which rises from it; but as the same river is called the Dordogne after its junction with the Dogne, we have adopted the name

^b Odouze and Jargean, p. 879.

^c Mezin, p. 898, 900.

^d So called from the Latin word *Pileatus*, because its summit is often covered with a cap of clouds.

with the coasts. The basin of the Garonne is formed by the Pyrenees on the south, the Cevennes on the east, and the Cantal, together with Mounts Odouze, Jargean and Beron, on the north. The Gironde discharges all its waters into the ocean. The Garonne, of which the name is a translation of the Latin word *Garumna* or *Varumna*, has its source in the valley of Aran in the Pyrenees. The Gers and the Save, which descend from the same mountains, are the only feeders of any consequence on its left bank; but on the right, it receives the Arriege,^a the *Auriger* of the ancients, and the Pactolus of Gaul,^b the Tarn, enlarged by the Aveyron, the Lot by the Truyere and the Celle, and lastly, the Dordogne, which rising from Mont-Dor, is fed by the waters of the Cere, the Vezere and the Isle. The Garonne receives the name of the Gironde after its junction with the Dordogne. The tide is perceptible in the river at thirty leagues from its mouth; the length of its course is about two hundred and fifty miles.^c Rafts and timber are floated down the stream from a place about two leagues above the small town of St. Beat, and it becomes navigable at Cazerès in the department of the Upper Garonne. A number of islands and sandbanks below Ambès,^d where it joins the Dordogne, render the navigation dangerous. The banks are bordered by heaths or downs at no great distance from its mouth, and the breadth of the river exceeds seven miles,^e but it becomes gradually narrower, and enters the ocean by a passage little more than two miles^f in width.

The basin of the Rhone, bounded on the north by Jura, on the west by the chain formed by Mount Pilat, Mount Mezen, the mountains of Saone^g and the Cevennes, and on the east by several mountains which may be considered the counterforts^h of the Alps, extends on the north to the Vosges, while its waters are discharged on the south into the Mediterranean. The Rhone, the *Rhodanus* of the ancients, rises from beneath the glaciers of Mount Furca, and enters France at some leagues to the east of St. Dizier. It is one of the most rapid rivers in Europe; the declivity has been estimated at thirty-three feet in each league.ⁱ The principal feeders on the right bank are the Ain, the Saone, the Ardeche and the Gard; it receives on the left, the Isere, the Drome, the Aigues and the Durance, the last of which rises at the base of Mount Genevre. The Rhone begins to be navigable at Seyssel on the boundaries between Savoy and the department of the Ain. The length of its course is equal to a hundred and eighty leagues, and of these a hundred and twenty are included between the frontiers of France and the Mediterranean. After it passes Beaucaire, it becomes less rapid; it flows slowly into the sea, and divides itself into four branches, in which several banks render the passage difficult.

The length of the basin watered by the Loire is still greater; it is bounded on the east by the mountains of Charolais, and part of the Cevennes, on the south by the mountains of Margeride, the Cantal and Mont-Dor, on the south-west by the heights of Gatine, and on the north by the hills, which form the plateau of Beauce, and which unite with the Armorican chain. The Loire rises from Mount Gerbier le Joux, at some leagues from the Mezen. It runs

first northwards, being separated from the Allier by the mountains of Forez and those of La Made; it then bends to the north-west, and continues in that direction until it reaches the neighbourhood of Orleans; beyond the last mentioned place, it flows westwards, and enters the ocean after a course of two hundred and twenty leagues. The mean depth of its waters is more than seven, but less than ten feet,^k and the declivity of its course, about twenty-three feet on each league.^l Rafts and timber are floated on its stream from the village of Retournac, at five leagues above Beauzac in the department of the Upper Loire; it becomes navigable a short way above Roanne in the department of the Loire. The Mayenne, swollen by the streams of the Sarthe and Loir, enters it on the right, but it receives no other important river from the same side, as it is not confined in that direction by lofty hills. Several large rivers which fall into the Loire, rise on the left from the chain of mountains, in which are situated the highest summits in central France; the principal of these rivers are the Allier, the Cher and the Vienne. The alluvial deposits conveyed by it, obstruct its mouth, and form sand banks which are daily increasing; thus in some places, the depth which was formerly twenty feet at low tide, does not at present exceed seven or eight.

The sinuous course of the Seine or the ancient *Sequana* traverses a basin formed on the south by the extension of the Armorican chain, which separates it in that direction from the Loire, and joins the mountains of Morvan; it is enclosed on the east by Mounts Moresot and Tasselot, the plateau of Langres, and the heights that separate the Meuse from the Aisne; while it is bounded on the north by the Faucilles and the Ardennes, which unite with the chalky hills that follow the course of the river to its mouth. The Seine rises between Chanceaux and Saint Seine, at the foot of a hill connected with the plateau of Langres. Timber is floated on it from the village of Oigni, in the department of Cote d'Or, but it does not become navigable until it reaches the village of Marcilly at its junction with the Aube. On the right bank, it receives the Marne at Charenton near Paris, and the Oise near Conflans St. Honorine above Poissy. The feeders that enter it from the left, are the Yonne at Montcreau and the Eure near Pont de l'Arche. The length of its course is about a hundred and sixty leagues. When the tide is full, the breadth of its mouth gives it a very majestic appearance, but at low tide, it looks like a number of canals flowing in the middle of an oozy bed. It is not easy to imagine the changes which take place during the equinox, and more particularly at the time of the syzygies; the billows enter the mouth of the Seine by narrow passages, rise to a considerable height, are precipitated into the bed of the river, and impede the course of its waters. The cry of the *Barre* then becomes a signal of alarm, and the houses on the banks have been more than once destroyed. The same sort of phenomenon has been observed at the mouth of the Loire, and also at that of the Garonne, where it is called the *Mascaret*.

Having thus briefly described the four principal rivers in France, it remains for us to cross the Vosges and to examine the Germanic basin or the basin of the Rhine. Formed

^a "Ariège."

^l "22 feet per league" Fr. meas.

by the declivities of the Black Forest and the Vosges, it extends from Huningen, at the foot of the lowest declivities of Jura, to those of Mount Tonnerre. The course of the Ill, the largest feeder it receives, is equal to about thirty-six leagues; it rises near the burgh of Winckell in the department of the Upper Rhine, and throws itself into the river at the distance of two leagues above Strasburg. The Moselle is a feeder of the Rhine, and for that reason its basin, although a separate one, may be considered as forming a part of the other.

On the west of the Germanic basin, are the two Belgian basins, the first of which is watered by the Meuse, a considerable river that traverses only a small part of France. It rises from the heights which form the plateau of Langres, a short way above the village of Meuse. The long and narrow basin of the river is bounded by the Ardennes, and the heights of the Moselle. It begins to be navigable at Verdun, and continues so to the frontiers of the kingdom.

The second Belgian basin, or that of the Scheldt, is formed by two ranges of hills, one of which on the north-east commands the course of the Meuse, while the other extends towards Calais. The country is watered by the Scheldt, which holds no inconsiderable rank among rivers, both because it receives several navigable feeders, and because it discharges itself into the North Sea.^a It takes its rise near Castelet in the department of the Aisne, and becomes navigable below Condé, at no great distance from the confines of France.

Of the remaining eight basins, five discharge their waters either into the Channel or the Ocean. The basin of the Somme is enclosed by the chain of hills that was last mentioned, and by another which extends towards Cape La Heve; its principal stream takes its rise at Font-Somme in the department of the Aisne, and may be considered a river,^b to which the Miramont, the Avre and the Cellé are tributary. It is navigable from Amiens to St. Valery, where it throws itself into the Channel after a course of about forty leagues.

The Orne receives the Noireau, the Aize, the Odon and other small rivers; it rises near Seez, in the granite heights on the north of Alençon; its basin is bounded by a northern branch of the same heights, and by another that stretches towards Cape La Hague. The course of the Orne is about thirty leagues, and it discharges itself into the Channel.

The basin contiguous to that of the Orne, may be called the basin of the Rance, from the name of the principal river, which, however, is not more than eighteen leagues in length. It is formed by the chain which serves as a limit to the preceding basin,^c and which proceeds westwards, under the names of the mountains of Menez and Arree, till it terminates to the northwards of Brest.

The mountains of Menez, and a chain of hills, extending

^a See, on the relative importance of rivers, the article *Rivières*, in the fifth volume of Physical Geography in the *Encyclopédie Méthodique*, by M. Huot. [The sentence in the text to which the note refers, is scarcely adapted to any other language than the French, and owes its propriety to the peculiar meanings attached to the words *fleuve* and *rivière*; the first implying a navigable stream which empties directly into the sea or other reservoir, and which receives other navigable streams or branches, and the second a stream which falls into another larger stream, or which does not receive navigable branches. The writer in the original, says that "the Scheldt deserves to be ranked among *fleuves*, because it receives several navigable *rivières*, and because it empties into the North Sea."—P.] ^b "Fleuve."

^c The granite heights to the north of Alençon, the southern limit of the preceding basin.—P.

^d "It is navigable for boats only for the space of 580 metres, where it

from the north to the neighbourhood of the Loire, bound the basin of the Vilaine, a small river which rises near Juvigné, and is rendered navigable by sluices at the village of Cessan; it is enlarged by the Meu, the Seiche and the Don, and reaches the ocean after a course of forty-five leagues.

The Charente, a sinuous river, about eighty-five leagues long, rises near the village of Cheronnac in the department of the Upper Vienne. The Ne, the Seugne and the Boutonne are the principal feeders; it begins to be navigable at Montignac, a few leagues above Angouleme, and throws itself into the ocean, opposite the isle of Oleron. Its basin is bounded by a chain that descends from the heights of Gatine, and by a range of hills, which separate it from the basin of the Garonne.

The basin of the Adour is bounded on the south by the Pyrenees, and by a chain of hills that extend from those mountains to the sandy plains of the Gironde. The river flows from the declivities of the Pic du Midi, and forms a cataract of a hundred feet in height, a short way above Bagneres. The length of its course is about seventy leagues; it quits the vallies of the Pyrenees, and receives the Midouze, the Luy, the Gave de Pau, the Gave d'Oleron, the Bidouze and several other streams. The Adour cannot be considered either a useful or important river; its course is very rapid, and the inundations occasioned by the melting of the snows, desolate the fields in the neighbourhood of the banks. It begins to be navigable at St. Sever, and throws itself into the Gulf of Gascony at Bayonne.

The Aude rises from a lake or pond of the same name in the Eastern Pyrenees, about a league from Mount Louis; the Orbieux, its principal feeder, is not navigable. The length of its course is about fifty leagues; boats, however, are seldom seen on it, until it joins the canal at Narbonne.^d The basin of the river is enclosed by Mount Espinouse, the Black Mountains and the extreme branches of the Pyrenees.

The basin bounded by the Moorish mountains, the mountains of Esterel, and their ramifications, is watered by several rivers, of which the Argens is the most important; it is formed by several streams that unite at Chateau Vert. The waters of the Artuby fall into the Argens, which enters the Mediterranean, after a course of twenty-four leagues. It is not navigable, and although it flows between high and rocky banks, it often inundates the adjoining fields, and forms pestilential marshes. The Hérault traverses the eastern part of the same basin from the Cevennes to the sea, a distance of twenty-eight leagues.^e

France is watered by ten great rivers, by a hundred and eight that are navigable, and by more than five thousand smaller streams and rivulets.^f But in order to complete the hydrographical account of the same country, it is necessary to notice the lakes and lagoons.^g Of the former, one only

joins the canal of Narbonne; the branch which falls into the Mediterranean, is only proper for floating timber."

^e There must be a mistake in this passage. The Hérault traverses the eastern part of the basin watered by the Aude. The basin watered by the Argens is in the eastern part of Provence, that river entering the Mediterranean at Frejus.—P.

^f "10 *fleuves*, 108 navigable *rivières*, and more than 5000 smaller *rivières* and rivulets."

^g "Étangs."—On the coast of Provence and Languedoc are a great number of inlets of the sea, which the French call *étangs*. They have a communication with the sea through a narrow channel, by which they are supplied with their waters, which are consequently salt. Ed Encyc.—They resemble the Venetian lagoons, and the sounds, bays and other inland waters between the sea islands and the main land, along the south shore of Long Island, and the coast of the S. States.—P.

need be mentioned; it is the lake of Grand-Lieu in the district^a of Nantes; it is formed by the waters of the Boulogne, the Ognon, and other small rivers, and it discharges itself by the Achenau into the Loire. It is about two leagues and a half in length, and nearly two in breadth. The only large lagoons in France are situated in the maritime departments in the south-west and south-east. That of Carcans in the department of the Gironde is about two leagues long by one and a half broad; it communicates with that of Canau, which is not much smaller. That of Biscarosse in the Landes is nearly of the same dimensions as the first; these, as well as others of a smaller size, are separated from the sea by downs. The boundary on the coast of the Mediterranean, between the departments of the Eastern Pyrenees and the Aude, divides that of Leucate, which is about three leagues long, into two almost equal parts. That of Sigeau, nearly four leagues in length, is situated in the department of the Aude. That of Thau, in the department of the Herault, is nearly as long as the last; it exhibits two phenomena not unworthy of notice; in the first place, it is salt, although fed by many fresh water springs; secondly, a sort of subterranean water-spout rises several feet above the surface near the northern extremity, and forms by its fall a circular pool.^b It communicates on the north-east by means of a natural channel with the lagoons of Maguelonne, Perols and Manguio, thus forming a length of more than thirty miles.^c The lagoon of Bere^d in the department of the Mouths of the Rhone, may be almost considered a gulf; it enters the sea by the canals of Martigues and the Tour de Bouc. It is about fifteen leagues in circumference, and a great quantity of salt is deposited in its calm and still waters. Several artificial ponds, not inferior in size to natural lakes, are situated in the interior of France; among others, that of Villers in the department of the Cher, and that of Indre^e in the department of the Meurthe; the first is about six leagues in circumference, and the second, four. The Seille, a feeder of the Moselle, issues from the last.

Two large promontories are situated on the French coasts; that of La Hague or La Hogue protrudes into the Channel, at the extremity of a department of the same name,^f while that of Raz forms the most western point in the department of Finisterre. The waves are broken into foam at the base of the last cape, and the view from its summit extends to a great distance along the ocean.

The same coasts are indented by large and deep gulfs; that of St. Malo in the Channel, includes the bay of St. Brieux^g on the left, and forms at its extremity the bay of Cancale, famous for its oysters. The road of Brest^h on the western coast of Finisterre might be more correctly called a bay, of which the depth at low tide is not less than from ten to fifteen fathoms, and the circumference about eight leagues; it communicates with the ocean by the strait called Le Goulet or the Gullet. The bay of Douarnenez to the south is still larger; its entrance is formed by Cape Chevre and Cape Raz. The bay of Morbihan, which gives its

name to a department, is about eight leagues in circumference. The bay of Bourgneuf, which is broader, but not so deep as the last, extends almost to the mouth of the Loire. The gulf of Gasconyⁱ which forms part of the ocean is bounded by the coasts of France and Spain; it receives at its extremity the small river Nivelle. The most important gulf in the Mediterranean, is the gulf of Lions, incorrectly written Lyons;^k an error which has led some geographers to suppose that it was called after the town of the same name, from which, however, it is more than fifty-five leagues distant in a direct line. During the middle ages, it was styled the sea or gulf of the Lion, because, from the frequency of tempests, it was formidable to mariners. It is known that St. Louis, after having embarked at Aigues Mortes, in 1269, was detained in the gulf by a storm which lasted three days.^l It is bounded by the coasts of five departments, namely, the Eastern Pyrenees, the Aude, the Herault, the Gard and the Mouths of the Rhone. Four bays are formed by the coasts in the department of the Var; namely, the bays^m of Cavaleire, Grimaud, Napoule and Juan.

It is unnecessary to mention all the islands near the coasts of France; Jersey and Guernsey are more important than any others in the Channel, but as they are under the government of England, they shall be described in the account of that country. The isle of Ushant (Fr. *Ouessant*) on the coasts of the ocean is surrounded by other smaller islands of the same name, and lined with rocks, which render the approach to it dangerous. It is equal to two square leagues in superficial extent, and its soil is by no means unfruitful. Groaix, a more productive island, is chiefly inhabited by fishermen. Belle-Isle, about four leagues in length, and two in breadth, yields rich pasturage. Noirmoutiers, equal to four square leagues in extent, is peopled by industrious inhabitants. Yeu is formed by a granite rock, covered with a light stratum of vegetable earth; the surface occupies a space of nearly six square leagues. The isle of Re, about five leagues long, and fifteen in circumference, is bounded by rocks on the north and the west. The land is ill provided with wood, and unfruitful in corn; the wealth of the inhabitants consists chiefly in the produce of their vineyards. Oleron, an island of considerable importance, is about six leagues long, and two broad; its salt marshes are very valuable. Camargue, an island in the Mediterranean, is formed by the alluvial deposits brought down by the Rhone; with the exception of a large marsh, the soil affords excellent pasturage. The isles of Hyeres,ⁿ of which the principal are Porquerolles, Port-Croz, Bagneaux and the isle of Titan or Levant,^o stretch to the distance of seven leagues from east to west; they are fruitful in oranges, strawberries and different aromatic plants. The islands of Lerins or those of St. Marguerite and St. Honorat are encompassed with reefs and almost uninhabited. Corsica is situated to the south-east of the latter islands; from its importance it is necessary to enter into some details concerning it.

^a "Arrondissement."

^b In it is a deep spot called *Ayysse*, from which rushes up a column of fresh water with such force as (in conjunction with strong winds) to produce at times waves dangerous to boats. The waters of this spot being much warmer than the surrounding ones, a circular space remains unfrozen in the hardest winters, when the rest of the lake is a sheet of ice. ⁿ Hyeres.

^o The easternmost island, whence the latter name.—P.

The island is partly covered with mountains, forming a group belonging to a range which a French geographer^a has denominated the Sardo-Corsican, because it is a continuation of the mountains in Sardinia. This group consists of the chain of Mount Caona on the south, the mountains of Cagnone in the centre, those of Frontogna on the north-west, and the chain of Titime on the north. Different counterforts or branches project laterally from these chains, and enclose numerous vallies or small basins. The seven of most consequence are those watered by the Tavignano and the Golo on the east, and the vallies of the Valinco, the Taravo, the Gravone, the Liamone and the Fango, which descend towards the western declivities of the island. None of these rivers are navigable. Several lagoons are situated on the eastern coast, the largest of which or that of Biguglia is nearly eight miles in length.^b The chain of Titime terminates at Cape Corsica^c on the north, the most important of any in the island. The numerous mountains that descend on the western side, enclose many bays and gulfs, among others, the gulfs of Valinco, Ajaccio, Porto and St. Florent. Several small islands are situated near Corsica, but none of them are of much importance.

Before we proceed to examine the soil in the different parts of France, it may be proper to make some remarks relative to the geology of the country. Granitic rocks or such as are anterior to the appearance of organized beings, are seen on the summits and declivities of the Pyrenees and the Alps, but the granite in the former is less ancient than the granite in the second. The granitic masses support volcanic summits in the Cevennes proper, and particularly in the Cantal and Mont-Dor. The granite in the Cevenno-Vosgian group disappears in the neighbourhood of Avalon, and is seen anew at the two extremities of the Vosges, or in other words, at the sources of the Moselle, and in the vicinity of the Ardennes. Granitic rocks also prevail in the Armorican chain, forming the crests of the small basins, watered by the feeders of the Lower Loire, and of that of the Vilaine, and covering almost all the surface in the departments of the Lower Loire, Morbihan, Finisterre, the North Coast, the Ille and Vilaine and the Channel.

From the remains of the granitic rocks, triturated and united by the action of water, are formed the masses of old sandstone which extend near the limits of the former. But at the time that their molecules were cemented, continents existed, for in their inclined strata are found vegetable remains. Extensive deposits of the same rocks are situated at the base of the Cevennes, on the banks of the Tarn, in the neighbourhood of St. Etienne, near Brives, in the territory of Bourbon l'Archambault, and on the banks of the Cher and the Auron. The same rocks bound the Vosges on the west and the south; they form their summits from the sources of the Sarre to the base of Mount Tonnerre, and appear again on the banks of the Moselle in the vicinity of Sierck.

The ancient ocean has left traces of its existence in every country on the earth; as its waters became gradually lower, calcareous strata and beds of sea salt were deposited on the declivities of the rocks which have been already indicated,

^a M. Brouguière, *Tableau des Montagnes*.

^d Roofing slate, a variety of argillite, the chain of hills in which it is found, being a branch of the primitive mountains in Brittany.—P.

^e The remarks in the above sentence refer to the *Ichthyosauri*, in the original; but the *Ichthyosauri* were characterized by a short neck, and a very long tail, whereas it was the *Plesiosaurus dolichodeirus* which was distinguished by a very long slender neck, consisting of thirty vertebræ. The other characters belong to the *Ichthyosauri*.—P.

^f M. Geoffroy de St. Hilaire.

and in basins of which the limits are still apparent. The whole chain of Jura may be considered the highest region of these deposits, which are supported on the south by the base of the Lower Alps, the Cevennes and the Pyrenees, and on the east by the base of the Higher Alps, and which form on the right of the Saone, the mountains of Charolais, the Cote d'Or and the plateau of Langres. The same deposits become lower towards the Mediterranean, and their declivities also extend in the direction of the Channel, occupying a zone, which may be traced from the banks of the Tarn to Valogne in the neighbourhood of Cherbourg; they form the ridge of the Ardennes, terminate at the sources of the Serre, and re-appear in the vicinity of Boulogne sur Mer.

But a second series of sediments is deposited on the latter formations, exhibiting to the south of Angouleme and Perigueux, and at the distance of some leagues to the north of the Garonne, the arenaceous and calcareous substances which belong to the chalk formation. It might be said that they have been accumulated in the depths of vast Caspian seas, of which the remains on the banks of the Dordogne, the Ille, and the Charente, extend to and are lost in the ocean, where they form the island of Oleron. Another deposit, much greater than the last, occupies an immense basin which, in its irregular windings, stretches into England, and which terminates on the west towards the range of hills, that diverges from the Armorican chain to the Loire, and that forms in the neighbourhood of that river the tegular schistus^d of Angers, while it extends on the south to the heights of Gatine, the ridge of Issoudun, and the hills near Bourges, on the east to those of Auxerre, and the declivities of the plateau of Langres and the Ardennes, and on the north beyond the Baltic.

The animals that existed in these Caspian seas differed wholly from any that now frequent the ocean. Among those that the naturalist considers the most remarkable, are large reptiles, which may be compared to monsters engendered in the imagination, exhibiting the singular spectacle of a head like a dolphin's, with the teeth of a crocodile, placed at the extremity of a long neck, consisting of eighty vertebræ, and attached to the body of a lizard.^e The remains of the marine reptiles, called *Ichthyosauri*, have been found in the blue marl near Honfleur, while those of the *Plesiosaurus*, an animal resembling a lizard, and about nine feet in length, have been collected near Boulogne and Auxonne. A third animal, to which a French naturalist^f has given the name of *Teleosaurus Cadomensis*, resembled in some respects the crocodile;^g it is found in the quarries near Caen.

At a period subsequent to the formation of the chalk basins, which cover a great part of Champagne, Normandy, Touraine, Picardy and Artois, the traces of smaller seas have been left in France. These traces may be discovered wherever there are beds of coarse limestone,^h similar to the kind used for building in the neighbourhood of Paris, or wherever there are arenaceous deposits resembling the strata beneath the same rocks.ⁱ The smallest of these Caspian seas, if they may be so called, covered a portion of the coun-

^e "Gavial"—Gangetic crocodile. "It is considered by Geoffroy as intermediate between the mammalia and the crocodiles." M. B.—P.

^h "Calcaire grossier"—lower marine limestone in the Paris basin.—P.

ⁱ "Resembling the lower strata of the coarse limestone." The lower beds are very sandy, so as sometimes to form a calcareous sandstone. The coarse limestone is succeeded below by the Plastic clay and sand formation, which rests immediately on the chalk.—P

try now watered by the Rhone, in the lower part of its course; the limits of it may be traced in the departments of the Herault, the Gard, Vaucluse and the Mouths of the Rhone. Another, and a somewhat larger sea, was situated to the north of the former, and was bounded by the declivities of Jura, and by those of the Cote d'Or, and the mountains of Charolais. The basin which it formed reaches from the north of Dijon to the south of Valence. A third, of still greater dimensions, covered almost all the surface in the departments of the Tarn, the Upper Garonne, the Gers, the Landes, the Gironde, and lastly, the Lot and Garonne. But the largest of them all extended over the departments of the Loiret, the Seine and Oise, and the Oise, and partly over the departments of the Aisne, the Seine and Marne, the Eure and Loir, the Loir and Cher, the Indre and Loire, and the Indre. The basins of these Caspians were not drained at the same epoch. While the one on the north, the last that has been mentioned, is formed by marine calcareous strata, in which the organic remains belong to animals wholly different from any that now frequent our seas, in the basin through which the Garonne flows, are found many shells similar to those of animals still existing. Deposits of gypsum, which repose on the calcareous strata, and which appear to have been formed in the depths of fresh water, seem to indicate that lakes succeeded the seas in the two basins of Paris and Avignon. Graminivorous quadrupeds frequented the banks of these lakes; but they were part of a creation very different from the one which now inhabits the surface of the earth. Their bones have been collected, examined and compared by a celebrated naturalist,^a and with the aid of a science, which has been brought by the same person to a high degree of perfection, their forms have been discovered, and even their habits conjectured. It is in the strata of Montmartre, Belleville and Montmorency, in the quarries of Aix, and in the calcareous marl near Orleans and on the Rhenish limits of France, that the bones of these ancient animals have been found. From their peculiar conformation, and the marked characters which distinguish them from every living being, names have been assigned them, which either indicate their antiquity, or the forms of their jaw-bones and teeth. Thus the Palæotheriums (ancient animals) have been divided into seven species, of which the largest is almost equal in size to a horse, and the smallest not larger than a hare. The only animals to which they bear any resemblance in shape, are the tapirs that exist at present in the new world. The Anoplotheriums (defenceless animals) are divided into six species, the largest of which is three feet high by five long, and the smallest not larger than a rat. The remains of the Lophiodons^b are chiefly found in calcareous marl; they resemble the tapirs in many respects, the difference consisting principally in their greater or smaller size.

At the period when the marine calcareous masses in the departments round Paris were covered with fresh water, there must have been large lakes in the highest part of France, among the mountains in the departments of Puy-de-Dôme, Cantal, the Lozere and the Ardeche, which deposited their sediment immediately on the granite; for no marine calcareous rocks have been observed in that lofty country. These basins appear to have discharged their waters in a northern direction, and to have augmented by their rupture the analogous de-

posits, which were forming in the great northern basin.^c In the deposits of these lakes are contained a great many organic remains, some of which are of the same kind^d as those of Montmartre, while others belong to hippopotami and to the *anthracotherium*, an animal in some respects similar to the hippopotamus. In addition to these might be mentioned the remains of reptiles and birds, different from any that now exist; and what is a new fact in the science, the eggs of gallinaceous birds perfectly entire. Lava and basalt rest above these fresh water basins; although the volcanoes from which they were vomited are now extinguished, their height and their craters still excite admiration. While they were emitting flames, animals existed in that part of France, which at present are only found in the warmest climates. Among these were elephants, rhinoceroses, hyenas, lions, stags of an immense size, and those large quadrupeds called mastodons, that have disappeared from the surface of the earth, but of which the remains are still collected in the new world. The most of these animals succeeded those which have been already described, and of which the remains are found in marl and gypsum; in Auvergne, however, their remains are contained in alluvial soils which are covered by ancient streams of lava and basalt, and from which it may be easy to prove the existence of volcanoes at different periods in that part of the country. It must not, however, be imagined that those large animals, which now inhabit Africa and Asia, were confined to the banks of the Allier. In the alluvial deposits that cover the floors in the caverns of Montpellier, are found tigers, lions, hyenas, panthers and hippopotami. Similar alluvial deposits^e in the vallies throughout France contain the remains of the same quadrupeds, and very many have been collected in the country round Paris. It is certain, therefore, that the climate of France, and, in general, of all the temperate regions, was at the period in which these animals existed, much warmer than at the present day.

The greatest part of Corsica belongs to the granitic formation. Calcareous rocks similar to those in the Alps and Jura are observed in two different parts of the island, namely, on the eastern coast a little to the north of Porto Vecchio, and on the northern coast near the gulf of St. Florent. More recent calcareous rocks and calcareous sandstones, which were left by the ocean, the last time it covered the present continents, are only observed in the southern part of the island, in the neighbourhood of Bonifacio.

The account that has been given of the different geological deposits in France, in the order of their formation, may prepare the reader to judge more readily of the mineral riches in the same country. From the variety of these deposits, some notion may be inferred of the substances which are contained in them.

We may commence with the rocks that are used in the arts, and which serve to decorate edifices and monuments. In the department of the Higher Alps are found grey, green, and rose coloured granite, and sienites of various colours, long confounded with granite, but more valuable from the fine polish of which they are susceptible. Besides these substances, there are brown and fine green porphyry, variolites with white, brown or black spots on a green or violet ground, and serpentine of a grey, green or brown colour, or veined with different shades. The same rocks are found in

^a M. Cuvier. See *Recherches sur les Ossemens Fossiles*, 5 vols. 4to. 1823.

^e "Terrains de transport"—diluvium.—P.

Corsica, but with more numerous varieties. Porphyry abounds in the Vosges, and granite is by no means uncommon in other departments, such as those of the Lower Loire, the Channel and the Sarthe. It was employed in paving the streets of different towns, but for some years past, the lava of Auvergne has been substituted in Paris for the same purpose.

Frenchmen long envied the marble quarries of the Italians, ignorant that others in their own country, might rival the most renowned in Italy. At present, different sorts of marble are worked in no less than forty departments; the best kinds are situated in the departments of the Upper and Lower Pyrenees, the Upper Garonne and the Eastern Pyrenees, particularly the schistous marble of Campan, which is of a red, green or delicate rose colour, and was first brought into repute by Louis the Fourteenth, who used it in decorating the palaces of Trianon and Versailles. Among others, in those departments, we might enumerate the marble of Sarancolin, which resembles a breccia, several kinds of statuary marble, and at least twenty other varieties, which it is unnecessary to particularize. Those who have seen the eight pillars that support the triumphal arch in the Place du Carrousel, may form a correct notion of the red and white marbles in the department of the Aude. The marbles in the department of the Arriege are of a dark blue or violet colour; the two sorts in the department of the Mouths of the Rhone, have been incorrectly called Aleppo and Memphis marbles.^a Two different kinds in the department of the Herault, the one of a white, and the other of a red^b colour, have served to adorn several edifices in the capital. Statuary, cipolin and other kinds of marble are obtained in Corsica, and the varieties in the departments of the Isere and the Ardeche are not less numerous. The marbles of Jura and the Lot are employed in those two departments; quarries of a finely grained and white coloured marble are situated in the department of the Vienne. It would be superfluous to mention all the departments in which the same substance is found; suffice it to say that it is obtained in those of Puy de Dome, the Lower Charente, the Saone and Loire, the Var, the Higher Alps, the Cote d'Or, the Aube, the Maine and Loire, the Sarthe and the Straits of Calais.

Other rocks, less ornamental but more useful than marble, are worked in different parts of France. Many workmen are employed in the extensive slate quarries at the base of the Pyrenees, and in the departments of the Maine and Loire, the Meuse and the Ardennes. Limestone, admirably adapted for building, is worked in the departments of the Dordogne, the Herault, the Loire, the Cote d'Or, the Yonne, the Meuse, the Moselle, the Oise and the Seine. Other kinds, not inferior to the last, are common in the departments of the Seine and Marne, the Seine and Oise, Calvados and the Channel. Excellent lithographic stones are procured from the neighbourhood of Mulhausen, Belley, Dijon and Chateauroux.

The ancient provinces of Burgundy, Champagne, Flanders and the Isle of France abound in clay, which the inhabitants convert into bricks and tiles. The decomposed feldspar contained in the granite rocks near Limoges and

St. Yrieix, furnishes kaolin, a very useful substance in the manufactory of porcelain. Pipe clay, not inferior to any other on the continent, has been long worked near Forge les Eaux in the department of the Lower Seine; another sort near Elbœuf in the same department, is much used in claying sugar. The clay in the neighbourhood of Beauvais and Montereau is employed in manufacturing the finest pottery. The departments of the Yonne, the Cher and the Lower Charente abound in flint;^c and the small town of La Ferté sous Jouarre exports millstones of the same substance^d to different countries of Europe, and even to America. The soft chalk in the departments of the Marne, the Seine, and the Seine and Oise, is fashioned into different shapes, and sold as an article of commerce;^e lastly, the gypsum obtained in the neighbourhood of Paris, furnishes the plaster so much used in the capital.

An increase has of late years been very perceptible in the products that form the mineral riches of France, and they may still be greatly augmented. The following is a list of the different metals obtained from the French mines in the year 1826.^f

Lead, reduced to the metallic state	6,453 quintals.
Sulphuret of lead	1,642 "
Copper, in the metallic state	1,394 "
Native arsenic	50 "
Antimony, reduced to the metallic state	412 "
Oxide of Manganese	7,550 "
Cast iron (first fusion,) bars, and steel	1,587,350 "
Silver, in ingots	3,286 lbs. avoirdupois. ^g

Lead ore is more common in France than in many other countries; it was from the mines of argentiferous lead in the departments of Finisterre, the Lozere and the Vosges, that the above quantity of silver was obtained. Mines of the same sort, at present unworked, are situated in the departments of the Arriege, Puy de Dome, the Upper Vienne, the Two Sevres, the Channel, and the Lower Rhine. The mountaineers in the department of the Isere sell frequently pieces of silver ore to the jewellers in Grenoble, from which it might be inferred that the mine of Chalanche, and perhaps others at no great distance, are very valuable. Manganese abounds so much in France, that it contains more than sufficient to supply the whole of Europe. Gold has been found in the alluvial soils deposited by several rivers. Many individuals formerly employed themselves in collecting particles of gold on the Salat, which issues from the Pyrenees, on the Sexe and the Gardon that rise in the Cevennes, on the Arriege and the Garonne near Toulouse, on the Rhone near the frontiers of the department of the Ain, and on the Rhine below Strasburg. At present, however, the trade of a gold-searcher is not very profitable, for on the banks of the Rhine, which are supposed to contain the greatest quantity, the value of the gold collected from Bale to the neighbourhood of Mayence, does not exceed in ordinary years L.625.

The other mineral substances, worked in France, make up a considerable part of its territorial wealth. Coal is found in thirty-two departments; others possess lignite, a different combustible,^h sulphate of iron, alum, mineral pitch and petroleum. Salt springs, and a mine of rock salt, discovered in 1819, are situated in the department of the Meurthe; the

vine occupies both these regions, and another still farther to the north, but does not succeed beyond a line which commences at a point some leagues northwards from the mouth of the Loire, and thence extending towards the north-east, passes to the south of the sources of the Eure, follows the contours of the heights which bound the right bank of the Oise, and stretching to the north of the Aisne and of Verdun, terminates on the north-east at the Rhine. Beyond this boundary the vine gives place to the apple. These limits, however, must not be considered as rigorously exact. Thus, maize might be cultivated in the country round Metz, for it thrives in the gardens; a considerable quantity is indeed cultivated in Brittany on the southern declivities of the mountains of Arree, and also in some parts of French Flanders.

The neighbourhood of the sea, by rendering the climate milder, extends its influence to vegetation; the fig and the myrtle, which seem to require a warm climate, flourish in very different latitudes. The first yields excellent fruit without shelter, in the neighbourhood of Havre and Cherbourg, while the same plant not only requires a favourable exposure in the vicinity of Paris, but the fruits are later and never so good. The myrtle grows in the open air in Cotentin, at Brest, and in Belle-Isle en Mer. At a hundred leagues farther south, but at a greater distance from the sea, it does not resist the severity of the climate without much care. The melon grows almost without culture on the coasts of Lower Normandy, but it is well known how much labour is bestowed on it in the neighbourhood of Paris, where, nowever, some sorts are produced, that surpass the best in Italy.

Lastly, the elevation of the soil has a great influence on different plants; thus the chestnut tree flourishes from the mountains of Forez and Auvergne to the southern extremities of France, and grows naturally in several woods round Paris.^a

The only useful plants really natural to France, are the fig, the apple, the pear and the plum; it ought not, however, to be forgotten that among the acotyledonous plants, the truffles in the neighbourhood of Angouleme and Perigueux, so much prized by gourmands, are indigenous to the country. Many useful and ornamental plants have been naturalized by culture; the cherry tree brought from Asia by Lucullus, was, as well as the vine, first planted in France by the Romans. The Greek colonies on the coasts of the Mediterranean transported thither the olive, a plant indigenous to Mount Taurus, and the raspberry-bush from Mount Ida. Since the discovery of the New World, France has obtained the acrivola^b of Peru, the lycopersicon^c of Mexico, the potato of Virginia, and the maize which has been incorrectly called Turkey corn.^d The humble parsley was brought from Sardinia, and the cardoon from Barbary. The pomegranate was also conveyed from Africa, and planted in the southern regions of France.

The gardens, the orchards and the fields in the same country, are now adorned with the productions of Asia; the orange, the lemon and the white mulberry are indigenous to China, the black mulberry to Asia Minor, the apricot to

Armenia, and the peach to Persia. Other plants first imported from Asia are now common, such as the almond, the walnut and the finest kinds of melons. Lastly, the kidney bean, the white endive and the pumpkin have passed from the burning climate of India to the temperate countries of western Europe. The gardener has been enabled by his art, to preserve in France, the lily of Palestine, the sunflower^e of Peru, the dahlia of Mexico, the balsamine of India, the reseda of Egypt, the angelica of Lapland, the tuberose of Ceylon, the tulip of Turkey, and the inodorous ranunculus, the only monument of St. Louis' pious expedition into Syria. The weeping willow, now common on the banks of rivers, was obtained from the neighbourhood of Babylon.

Near the most common forest trees in France, such as the oak, the birch, the elm, the ash and the beech, may now be seen the false acacia,^f which Robin brought from Virginia, different American oaks, and the horse chestnut tree, indigenous to Turkey in Asia. The Norwegian and Canadian firs now grow in the highest regions of the kingdom. To the aspen tree, and the black and white poplars, originally natives of the country, are added other species from Italy and America. But all the woods and plantations in France do not occupy a greater surface than 17,500,000 English acres^g—an extent too small not to render it peculiarly desirable to employ all the means necessary for the preservation of the forests.

Local industry, climate, and a favourable exposure, add in several departments to the value of certain plants. Forests of resinous trees extend along the sea coast in the department of the Landes, throughout an extent of thirty or forty leagues; in the same country and in the department of the Lot and Garonne, the *Quercus suber* or cork tree is cultivated. The firs of the Vosges and Jura are used by the house carpenter; indeed in that part of France, few or no firs are imported from northern countries. The pine furnishes the peasant of Brittany with a substitute for oil and candles. The fruit of a particular kind of cherry tree, that abounds in the Vosges, yields by distillation a *kirschenwasser*, not inferior to any that can be had in the Black Forest. The mulberry, the olive and the orange are cultivated in the southern departments. The fruit of the plum tree forms a considerable branch of commerce in the departments of the Var, the Lot and Garonne, and the Indre and Loire. The finest fruits in the country round Paris are the chasselas^h of Fontainebleau, the peach of Montreuil and the cherry of Montmorency.

Different garden vegetables have acquired, on certain soils, a superior quality; one or two instances may be mentioned, among others, the kidney beans in the neighbourhood of Soissons, the carrots of Amiens, and the artichokes in the country round Laon.ⁱ The vineyards in France yield two hundred and fifty different sorts of wine; they extend over a surface of 5,000,000 acres,^k and their mean produce is estimated at 880,000,000 gallons.^l The best sorts of wine are obtained from the ancient provinces of Champagne, Burgundy, Lyonnais, Dauphiny and Bordelais.

To divide the soils of France into seven different classes, after the example of Arthur Young, might lead to errors

which have been too often repeated.^a As there is not a single department in which the surface does not consist of lands, more or less rich, light, stony or sandy, how can twenty-one departments be arbitrarily classed under rich or heavy soils, nineteen under heath lands, eight under chalky soils, two under gravelly soils, fifteen under stony soils, as many under mountainous lands, and six under sandy soils? The study of geology tends to correct such mistakes; thus, what has been called vegetable earth, is merely an alluvial stratum, formed while the surface of the different formations was covered with fresh water; the same stratum is more or less fruitful in proportion to the quantity of decomposed vegetables contained in it; if thin, it mixes with the rocks that support it; if imperceptible, sand, clay or calcareous substances, exposed to view, form a soil in which the perfection of agriculture consists in supplying the defects of nature. Lastly, the inequalities in the surface have a great influence on the fertility of different soils, because in low vallies the alluvial deposits are greater than in plains, and the latter for the same reason are more fruitful than hills or lofty ridges. It would not, however, be difficult to point out a great extent of surface, where the soil, naturally sterile, might be fructified by the efforts of industry, and a judicious system of agriculture. A great part of the Vosges and the Pyrenees and almost the whole of the Dauphinese Alps are very unfruitful, although the Cevennes, in which the rocks are of the same kind, prove what may be done by the persevering labour and industry of man. In that part of the country, as well as in some parts of Auvergne, walls are raised at different distances, along the sides of the mountains, in order to retain the alluvial deposits, which otherwise would be carried by the waters to the lowest vallies. The southern portion of the department of the Gironde, and almost the whole of that of the Landes, are covered with sands, which might become wholly unproductive, if the inhabitants did not avail themselves of the plant best adapted to the nature of the soil, namely, the maritime pine, which yields a great quantity of resin, and thus enables them to carry on no inconsiderable trade. If the same sands are mixed with any calcareous substance, such as the fossil shells in the neighbourhood of Bordeaux, they form a soil favourable to the culture of the vine; they may be even rendered productive by force of manure, as for example, the plain of Boulogne near Paris. By the same means, the present sterile sands of Sologne in the department of the Cher, and others in Brittany might be cultivated. The chalky plains of Champagne are fruitful wherever their surface is covered with an alluvial deposit of argil; but in the more arid parts of the same province,^b different evergreen trees might be planted. The importance of encouraging agriculture in France, may be admitted from the fact, that the surface of unproductive or waste lands, cannot be estimated at less than 10,000,000 acres,^c or in other words, at a twelfth part of the whole kingdom. If so great a surface were rendered productive, a considerable increase must necessarily follow in the number of inhabitants, since more than a sixth part would be added to the amount of arable land in France, which is considered equal to 57,000,000 acres.^d The average produce of the same land,

^a The above mentioned division is still adopted in the last edition of Guthrie's Geography. Tr. ["In the last edition of the French work entitled: L'Abregé de la nouvelle Géographie universelle, d'après Guthrie, par Hyacinthe Langlois, 1823."]

• The hectolitre contains nearly three English bushels. Tr. [The

according to the most correct calculations, is equivalent to 51,500,000 hectolitres^e of wheat, 30,300,000 of meslin, 6,300,000 of maize, 8,400,000 of buckwheat, 32,000,000 of oats, and 20,000,000 of potatoes. It follows from the nature and position of the soil in different parts of France, that eleven departments, namely, those of the Lozere, the Creuse, Finisterre, the North Coast, the Channel, Calvados, the Orne, the Lower Seine, the Somme, the Straits of Calais and the North, are wholly destitute of vineyards, that about forty produce flax, and that hemp is extensively cultivated in fifty-seven.

It is unnecessary to enumerate the plants that compose the French Flora; it may be observed, however, that they are divided into more than 830 genera and 6000 species, a number greater than that in Germany, although the latter country is larger than France.

The wild animals that frequent the mountains, woods and fields, are not so numerous as in Germany, because the forests are not so large, and the mountains not so extensive. The black bear (*Ursus Pyrenaicus*) and the brown bear are found in the French part of the Pyrenees; the lynx, of which the piercing eyes are proverbial, frequents the High Alps; it is now, however, more rarely observed than formerly; the chamois and the wild goat never leave the summits that form the eastern and southern limits of the kingdom. The forests of the Vosges, and the woods on the Moselle, afford shelter to the common squirrel (*Sciurus vulgaris*); another species of a dark brown colour varied with yellowish white (*Sciurus alpinus*), and the Siberian flying squirrel,^f which issues from its retreat in the night, and by means of its dilated sides, springs from one branch to another, are not uncommon in many parts of the High Alps. The yellow marten (*Mustela alpina*) is found in the same mountains; the marlot (*Arctomys marmotta*), a social animal, frequents the cavities near the summits of the French Alps and Pyrenees.^g In the departments contiguous to the Vosges, may be seen the ermine (*Mustela erminea*), of which the fur is imported from the frozen plains of Siberia, and the hamster (*Mus cricetus*), famous for its migrations, and found in the north and south of Russia, and in Poland, the Ukraine, Hungary, Germany and Alsace, where it is called the marmot of Strasburg. The hamster lays waste the crops; each of them, it is said, amasses in its burrow from twelve to a hundred pounds of grain; as intrepid as it is fierce, it never retreats before its enemies, not even before man, who has so much interest in destroying it. All the more extensive forests serve as places of refuge for the wolf, the most destructive of the carnivorous animals in France. In some provinces, the polecat, the weasel and the fox are the terror of the poultry yards. The solitary and distrustful badger digs its den in the remotest woods, and the mole raises its hills in the most fruitful fields. The hedge-hog lurks in the bushes, and the rat, the field mouse, the common mouse and the dormouse frequent the fields and the gardens. The water rat (*Arvicola amphibius*) and the otter seek holes in the banks of such marshes and rivers as are little frequented.

Almost every species of bird, common to Europe, is found

hectolitre contains 6102.8 cubic inches, and the English bushel 2510.42 cubic inches; consequently the hectolitre is equal to 2 bushels, 1 peck 5 quarts, and 2.5 pints, nearly.—P.]

in France. The flamingos that migrate from the shores of Africa, appear in flocks on the coasts of the Mediterranean. The witwall (*Galgulus garrulus*)^a of which the plumage is varied with tints of blue, green and violet, is by no means rare in the southern departments; among others in the same part of the country, are the midwall (*Merops apiaster*),^b probably indigenous to the island of Candia, the beccafico or fig-pecker, which is sold for high prices in Paris, and the piannet or creeper that frequents steep rocks or the walls of ancient castles. Numerous species visit France every year at the approach of spring, and remain until the end of autumn, passing the winter in a warmer climate. Among these are different species of the lark and the thrush, the quail, the ortolan, and the red-breast, all of which are sought for the table; the hoopoe, the oriole, the titmouse and the kingfisher, all of which have their plumage adorned with the most vivid colours; the turtle dove, which appears to exist only for the indulgence of the tender passion, but which may be considered rather an emblem of inconstancy, than of fidelity; the swallow, which builds its nest on the houses; and the nightingale, which sings in the groves, when fresh with the first colours of spring. Among the other singing birds are the goldfinch, the linnet and the bulfinch; the jay and the starling are noted for the facility with which they learn to imitate the human voice.

Several species of gallinaceous birds abound in different parts of France; the red partridge is often observed in the central and western departments, but in the southern, the grey partridge is more common than any other species. Woodcocks and snipes frequent the woods and marshes; the first are very numerous in Picardy, and the second in Auvergne. Lastly, the coasts of the Channel and the Ocean are frequented by different kinds of wild fowl, such as the plover, the lapwing, the widgeon,^c the sea lark and the wild duck, of which a great many are sent to Paris by the inhabitants of the Lower Charente.

The common viper and the asp are often seen in mountainous, stony and wooded districts, such as the country round Lyons, Grenoble and Poitiers; it has been remarked that these venomous reptiles appear most commonly in the morning, and in places with an eastern exposure; they live on insects, mice and other small animals. The reptiles common to the central departments of France, are the viperous adder,^d and the green and yellow adder,^e which may be easily tamed. A peculiar species called the *Bordelaise*,^f as well as the masked adder, is found in the neighbourhood of Bordeaux; another species,^g which grows to the length of six feet, is confined to the southern provinces; the *Provençale*, which is never longer than seven or eight inches, indicates by its name the country it inhabits. Many of the snakes are not dangerous;^h some indeed, known by the name of hedge

eels in the rural districts, are not considered unwholesome food. The animals belonging to the Saurian order,ⁱ are sufficiently numerous, but the most remarkable is the gecko of Mauritania, which frequents the Mediterranean coasts. A crocodile still preserved at Lyons, was taken from the Rhone about two centuries ago. Could it have been the last descendant of the reptiles, of which the fossil remains are found among the calcareous strata in France, or was it carried by currents from Africa to the mouth of the Rhone? Among the animals of the Batracian order,^k different species of frogs and toads may be mentioned. The *Rana bombina* abounds in the central districts, and during rainy nights annoys the inhabitants with a continued and disagreeable croaking. The *Bufo obstetricans*, which conceals itself under stones, and frees the female of its eggs in order to carry them to some pool, is found in every department. The green toad, which, when struck, diffuses an odour resembling that of ambergris, and the thorny toad,^l a hideous animal, some of them of a monstrous size, are confined to the mountainous districts. The turtle, which the ancients used in making their lyres,^m is sometimes taken on the coasts of the Mediterranean and the Ocean; the fresh water tortoise,ⁿ not uncommon in the southern marshes, is frequently kept in gardens, because it destroys insects and noxious animals. The water eft is most common in the southern departments; the ordinary lizard frequents them all.^o

Many individuals are employed in fishing on the extensive coasts of France, and the products of their labour are distributed in the remotest districts. The Channel and the Ocean supply the inhabitants with turbot, ray, soles, cod, salmon, whiting, mackerel, mullet and sardel. The last kind is so abundant that the sardel fisheries on the coast of Brittany, yield an annual profit of L.83,000. Other kinds are taken by the fishermen in the Mediterranean; the most valuable are the tunny and the anchovy.

Cetaceous animals sometimes appear on the French coasts; a cachalot or *trumpo*^p was taken in the neighbourhood of Bayonne in 1741; thirty-one large cachalots belonging to a distinct species^q (*Physeter macrocephalus*), were stranded by a tempest on the western coast of Audierne in Lower Brittany, in 1784. The whale, the giant of the northern seas, frequented the gulfs of Gascony and Lions in the time of Strabo and Pliny.^r The Basques derived considerable profit from their whale fisheries about the beginning of the twelfth century; since that time the whale has fled for refuge from man into the frozen seas, and its appearance on the French coast is cited as a rare phenomenon. In 1620, a whale more than a hundred feet in length, was stranded on the island of Corsica; in 1726, another at least seventy-two feet long was taken in the bay of the Somme; one about fifty-two feet in length, was thrown on the island

^a The common roller (*Coracias garrula*, Linn.) The witwall is the common European oriole (*Oriolus galbula*, Linn.)—P.

of Oleron in 1826; lastly, the inhabitants of St. Cyprian near Perpignan, found a whale on the shores of the Mediterranean in 1828, which, according to their measurement, was sixty-three feet in length.

The terrestrial mollusca might be passed over in silence, if several species, valuable as delicacies, or useful as remedies in pectoral affections, were not included among the *helices*^a or snails. Three different species,^b common in the fields of southern France, together with the *Helix pomatia*,^c the most common of them all, since it is found in every vineyard, the shagreen snail that frequents the gardens, and the nemoral snail^d of the meadows and fields, are those that are eaten, or which furnish the materials for broths and cosmetics. Immense numbers of them are consumed in Alsace and Saintonge; from the last province alone, snails are in some years exported to the amount of L.1000;^e they are even sent to the Antilles.

The fishing of marine mollusca forms a much more important branch of industry; the horse-foot oyster (*Ostrea hippopus*), common on the coast near Boulogne sur Mer, is by no means considered the best sort of oyster. The common oyster (*Ostrea edulis*) is so much prized, that the quantity consumed every year in Paris, is equal in value to L.42,000.^f The departments of the Lower Charente, the Channel and Calvados, are those in which the best kinds are taken. The common muscle (*Mytilus edulis*) is a valuable food to the lower orders on some of the French coasts. The crustacea, too, are very useful for the same purpose. The *Portunus velutinus* and the *Cancer pagurus*,^g form partly the nourishment of the people in the seaports and on the coasts. The lobster (*Astacus marinus*), and another species (*Palinurus vulgaris*), remarkable for its great size and its brown and yellow colour, appear on the tables of the wealthy Parisians.

Several noxious insects are found in France, some of which are indigenous to the country. Among these are a particular species of weevil,^h very destructive to grain; the European and red scorpions,ⁱ which are not unknown in the departments on the coasts of the Mediterranean; and the *black bellied lycosa*, a sort of tarantula spider, which is observed in the same part of the kingdom, and which is very similar to the one concerning which so many fables have been related in Italy. The commercial relations between France and India have been the means of transporting others from the latter country; among these are the aphid, which destroys the apple tree, and two species of *termites* or white ants, the *Termes lucifugum* and *T. flavicolle*, which are mostly confined to Provence and the neighbourhood of Bordeaux, where they devour the timber in the houses and naval arsenals. Although not numerous, other insects are very useful; the bee enables the inhabitants of the southern provinces to export a great quantity of honey; the silk-worm, habituated to the climate, since the time that Louis the Eleventh planted the mulberry tree in France, forms by its products part of the riches of Dauphiny. The weight of the raw silk thus obtained by the French manufactories, is estimated at 5,200,000 kilogrammes.^k The winged insect

that forms the gall nut, adds very considerably to the value of the oaks in the southern departments, and the cantharides furnish one of the most powerful agents that are used in medicine.

It now remains for us to give a short account of the most useful domestic animals in France, and thus terminate the few remarks that have been made concerning the animal kingdom in that country. The breeds of horses, to which little attention has hitherto been paid, might be greatly improved, so as to rival the finest that are known in Europe. Government has proposed to encourage the crossing of different breeds, and if the judicious plans which it has formed, be carried into effect, the results that may be reasonably expected, must be attended with great advantage. Good cavalry and post horses are bred in the departments of the Somme, the Straits of Calais, the Ardennes, and the Upper and Lower Rhine; but the horses in the departments of the Seine and Oise, the Aisne, and the Seine and Marne, are better fitted for artillery. The best carriage and saddle horses are from the departments of the Orne and Calvados; they belong to the breed which is said to have been introduced into France by the Danes, who under the name of Normans, settled in the country. The horses in the departments of the Maine and Loire, the Sarthe, the Eure and Loir, the Drome, the Isere, the Higher Alps, the Upper Saone, the Doubs, and Jura, are better adapted for light cavalry. The horses of Morbihan and Corsica are by no means remarkable for their symmetry, but they are said to be almost indefatigable. Other breeds in the departments of the Ain, the Cote d'Or, the Saone and Loire, the Allier and the Nievre, are equally reputed for the same qualities; but the best horses both for strength and swiftness are bred in some parts of southern France. The Limousin breed is confined to the departments of the Correze, the Upper Vienne, Cantal, Puy de Dome, and the Dordogne. The horses, known by the name of *Navarrins*, are most common in the Eastern and Lower Pyrenees, but they are also bred in the departments of the Aveyron, the Lot, the Gers and the Arriege.

The French ass must be considered a degenerate animal, if compared with the asses of Spain and Italy; one breed however, in the department of the Vienne, forms an exception; it is remarkable for its long hair and great size, almost equal to that of a mule.

It is believed that there are not fewer than twelve or fifteen kinds of oxen in France. Those in the departments of the Upper Vienne, the Charente and the Lower Charente, are most probably of the same breed; they are of a pale reddish^l colour; their horns are long, large and tapering, their weight varies from six hundred to eight hundred and fifty pounds.^m The oxen in the departments of the Creuse, the Indre and the Cher, are for the most part of a light colour;ⁿ they weigh from five hundred to seven hundred pounds. In the department of the Gironde, the oxen are of a dirty white colour; they are heavier than the two last kinds. In the departments of Cantal and Puy de Dome, they are mostly of a red colour with short and white horns;

^a *G. Helix*, Linn. The translator calls them *helecites*, a name which has no existence in the nomenclature of natural history, nor in any other language. Fossil snails are called *helicites*.—P.

^b *H. variabilis*, *H. rhodostoma*, and *H. vermiculata*.

^c Common edible snail, the *cochlea* of the ancients.—P.

^d *H. nemoralis*—Girdled snail, Donovan.

^f "Nearly 1,000,000 francs."

^g "Tourteau"—common crab. ^h *Curculio granarius*.

ⁱ "Tourteau"—common crab.

^j *Scorpio Europæus* and *S. Occitanus*.

^k The kilogramme is equal to a thousand grammes; the gramme is nearly equal to 19 grains. Tr. [The gramme is equal to 18.827 French grains, or 15.4441 grains Troy.—P.]

^l "blond roux," light red.—The prevalent colour of the cattle in France is a pale reddish, or rather a cream colour. Ed. Encyc.

^m Ninety-one and a half of these pounds are equal to 100 lbs. Avoirdupois. Tr.

ⁿ "blond pale," light yellow.

they weigh from five hundred and fifty to eight hundred and fifty pounds. The oxen in the department of the Saone and Loire, are as heavy as those in the Upper Vienne. The oxen in the departments of the Lower Loire and the Maine and Loire are grey, black, dark brown and chestnut-coloured; many of them are equal in weight to nine hundred pounds. In Morbihan, they are small and spotted; they weigh rarely above five hundred pounds. A breed of low oxen, not uncommon in the department of the Sarthe, has the advantage of being easily fattened. The other kinds differ so little from those which have been already mentioned, that it requires a good judge to distinguish them. They are not all reared in the countries in which they are produced; thus few are bred in Lower Normandy, but very many are fattened in its rich pastures.

Sufficient attention has not been paid in France to the breeding of sheep; at all events, the wool in the country is still inferior to that of Saxony. Sheep are more numerous in the ancient province of Berry than in any other part of the kingdom. Those bred in the country round Beauvais are very large, but the sheep in Burgundy and the Ardennes are better for the table. The best kinds are those on the sandy coasts of the maritime provinces. The sheep of Roussillon are very like the merinos in the fineness of their wool. The advantages that result from crossing the different Spanish and French breeds have been already sufficiently proved; still, however, that branch of rural economy is neglected, such are the effects of ignorance and prejudice.

Three different breeds of pigs are common in different parts of France. The pure breed, as it is called, existed in the country in the time of the Celts, and is still preserved in Normandy; it may be fattened until it attains to a great weight; some of them weigh from three hundred to four hundred pounds; it is distinguished by its small head, narrow ears and white colour. The pigs of the Poitou breed are not so large, neither are they so well made; they are remarkable for large heads, broad pendent ears and long

white hair. A third breed in Perigord differs from the others in the roughness of its coat, and in its black colour. The other kinds are sprung from these three breeds; they resemble more or less one or other of them, and differ principally in their colour, black being prevalent in the south, white in the north, and black and white in Central France. A great many pigs are bred in the departments of the Upper Rhine, the Moselle, the Meuse, the Aube, the Marne and the Lower Pyrenees.

The poultry in some of the departments are not the least valuable of their products; *the cock and hen of Caux* form a distinct variety; to ascertain its superiority, it is necessary to partake of the excellent fowls that are fattened in the neighbourhood of Barbezieux, La Fleche and Mans. The ash-coloured goose (*Anser cinereus*),^a the type of the domestic goose, attains a great size in Lower Languedoc; there are many of them also in the departments of the Lower Rhine and the Upper Garonne and in others in Western France. The best ducks, it is said, are those in Lower Normandy and Languedoc. The manner in which the goose and duck are fed in some departments, renders their livers excessively large, and gives them a delicacy that gourmands are able to appreciate. The geese round Strasbourg, and the ducks round Toulouse, are thus tortured to gratify the corrupt tastes of the Parisians.

That different branches of rural economy require to be improved, must be admitted from the fact that the number of domestic animals is not sufficient for the wants of the inhabitants. France imports every year on an average about 23,000 horses, 900 asses, 800 mules, 40,000 oxen, 167,500 sheep, 4700 goats, 148,800 pigs, 5,800,000 raw hides, 5,900,000 kilogrammes of fine and coarse wool, and a great quantity of feathers. Such imports, amounting in value to nearly L.2,000,000,^{b,c} say very little for rural industry, which instead of being dependent in any way on foreign countries, ought to swell the tide of exportation from France.

^a The common domestic goose is derived from a wild species of a grey colour, with the back brown shaded with grey, (*Anser cinereus*, Mayer.) Cuvier.—P.

^b "—at least 45,000 000 francs."

^c See the memoir by M. Senac, entitled: *Projet de Société d'Amélioration des animaux domestiques*, inserted in the Bulletin Universel des Sciences et de l'Industrie: section des Sciences Agricoles, 1826.

BOOK CXLII.

EUROPE.

Europe continued.—Kingdom of France.—First Section.—Southern region.

SOME account has been given in a preceding book of the people from whom the French are descended; it has been seen that their chiefs have added to their power by conquests, and that in some instances they have wielded the destinies of Europe. The resources which France derives from its climate, soil and natural wealth, were enumerated in the last book. Such at least was the end proposed in describing the country in its connexion with historical and physical geography. It now remains for us to examine France in detail,—a task not without difficulty. It would be desirable to adhere to the accuracy and precision which ought to be the basis of topography, and at the same time to avoid unnecessary repetition in naming the departments, districts^a and chief towns, which, unlike the old governments and provinces, have not the advantage of being connected with historical associations, but which have contributed to render the population more homogeneous. The artificial division by which France is made to consist of five regions, those of the south, the east, the centre, the west and the north, appears on the whole to be the best, or at least the one by which its chorography may be the most conveniently explained. Besides, the same method has been established by custom, it is familiar to a great many persons, and it is also useful in another point of view, for the old and new divisions may thus be made to coincide with tolerable accuracy. The same route that has been followed in the last book, namely, the one from the south to the east and north, may be continued in the present.

Corsica is the largest French department in point of extent, but one of the least in point of population.^b Placed between Italy, Spain and France, civilization and industry may one day render it a very advantageous commercial and maritime station; indeed when European states acknowledge the folly of maintaining colonies, long since proved to be more onerous than profitable, France may find in the

^a "Arrondissements."—The kingdom of France is divided into eighty-six departments, and these again are subdivided into districts, called *arrondissements (arrondissemens communaux)*. For the purposes of civil administration, each department constitutes a prefecture, and each *arrondissement* a subprefecture, (with the exception of the *arrondissements* of Paris;) but the prefect of the department performs the duties of subprefect in the *arrondissement* in which he resides, (viz. that including the chief town of the department.) The *arrondissements* consist of a greater or less number of communes, each of which has a mayor and communal municipality. A commune is sometimes a single town, and sometimes a union of several small towns or villages. The city of Paris constitutes only a single commune, but it is divided into twelve *arrondissements*, each of which has its mayor. It also forms only a single subprefecture, under the immediate control of the prefect of the department. For judicial purposes, the *arrondissements* are divided into districts (*cantons* or *justices de paix*), each of

fruitful soil of Corsica, and in its climate, well adapted for colonial produce, a source of wealth that requires apparently only an enlightened government to be realized.

When the traveller, who quits the coasts of France for the port of Ajaccio, first observes the island, it has the appearance of an enormous pyramid formed by mountains, which, from the effect of distance, seem to be grouped round each other. Ajaccio,^c the chief town or the residence of the prefect, is not the largest of the Corsican cities. Bastia, which was formerly styled the capital of the island, is the most populous; but Ajaccio is considered the most ancient, for it was the seat of a bishopric at so early a period as the sixth century. It is true that the miasms from a neighbouring marsh, made the inhabitants determine to abandon the place in the year 1435, so that the present Ajaccio is distant about a mile^d from the site of the ancient town. The streets are broad and straight, the houses are not without elegance, the palace of the prefect^e is at once a simple and imposing edifice, the barracks are large, the harbour is spacious and convenient, and the entrance into it is guarded by a citadel. The places connected with education, by so much the more necessary as the inhabitants are still bigoted to their prejudices and ancient customs, are a college, a library of 13,000 volumes, a botanical garden, and an agricultural society. A large edifice is at present building to serve as an hospital,^f an asylum for foundlings, and a school for young girls. The commerce of the town consists in the sale of the oil and wine produced in the neighbouring country, and in the coral which is obtained on the southern coasts. Ajaccio is likely to be for ever memorable, for Napoleon Bonaparte was born within its walls in 1769. Urcino, a small anchorage in the gulf of Sagona, at some leagues to the north of Ajaccio, indicates the site of *Urcinium*, a Roman town, once well known on account of its earthen vases, in which the ancients kept their Falemian. Ajaccio is the residence of the bishop and the prefect; but Bastia, situated at the opposite extremity on the coast front-

which has a justice of peace (*juge de paix*.) These districts are in general composed of a greater or less number of communes, but in the commune of Paris, each *arrondissement* constitutes a judicial district.—P.

^b Corsica was at first divided into two departments, that of the Golo, comprehending the north, (Bastia, the capital,) and that of the Liamone, comprehending the south part of the island, (Ajaccio, the capital.) (See Peuchet, *Statistique de la France*, 1805.) It now forms only one department, that of Corsica. This union took place under the imperial government. (*Almanach Impérial*, 1813, p. 388.)—P.

^c Ajazzo.

^e "Hôtel de la préfecture"—government house.

^f "Hospice civil"—alms-house.

ing Italy, is the residence of the commander in chief.^a As a fortified town, it is considered as belonging to the first class; it has a college and a theatre. A society for the purpose of diffusing instruction^b has of late years been instituted. It is not so well built as Ajaccio, but as it is constructed in the form of an amphitheatre, it has a better appearance at a distance; its harbour can only receive small vessels, but commerce and industry place it above its rival; it carries on a trade in soap, paste, wax, liqueurs^c and other articles. The burgh of Mariana at four leagues to the south, near the banks of the Golo, stands on the site of an ancient town, which bore the same name, and which according to tradition was founded by Marius.

The other towns in the island are of less consequence. Calvi on the western coast is defended by a fortress, and its anchorage might contain a large fleet. St. Florent^d is situated at three leagues to the west of Bastia, and Porto Vecchio on the eastern coast is noted for its good wine and granite quarries. These places, as well as Bonifacio, at the southern extremity of the island, which carries on a trade in wine, oil and coral, are provided with convenient and safe harbours. Sartene, situated at the base of the heights, which command the left bank of the Valinco, has been entitled a subprefecture. Corte, almost in the centre of the island, near the confluence of the Orta and the Tavignano, is a poor and ill built town; its isolated situation in a mountainous district at a comparatively great distance from the sea, prevents the increase of its commerce, which consists merely in agricultural products.

The passage boats between the island of Corsica and France were by no means remarkable for their celerity, but since the commencement of the year 1830, steam vessels have sailed regularly, and the communication between the two countries, has in consequence been much facilitated.^e The mouth of the Var may be seen from the vessels as they approach the port of Antibes; the lower part of the same river serves as a boundary between the kingdom of France and the county of Nice, now dependent on the Sardinian crown. The department of the Var forms part of Provence, the earliest conquest of the Romans in Gaul, and by the same people called *Provincia*, an appellation from which the modern name has been derived. Antibes, a place of great antiquity, the *Antipolis* of the ancients, was founded 340 years before the vulgar era by the Greek colonists that built Marseilles. Augustus made it a municipal town, but before his time it must have been a place of some consequence, since it had its theatre and other public buildings, of which the ruins still remain. Trade animated its harbour, and the tunny fisheries furnished employment to many individuals. Although it has now lost its commerce,^f it is still important as a military station. As a strong town it belongs to the third class; such as it is, however, it may oppose a barrier to the invasions which threaten France from the Sardinian frontier. The island of St. Marguerite rises between the gulfs of Juan and Napoule; its strong castle, once a state prison, served as a place of confinement for the mysterious

prisoner with the iron mask. Cannes, where Napoleon landed in 1815, may be mentioned among the maritime towns in the department of the Var; sixteen years before that period, he disembarked at Frejus on his return from Egypt.^g The last town, although small, is larger than Cannes;^h it was the ancient *Forum Julii*, a place embellished by Julius Cæsar and Augustus, but probably founded, like Antibes, by a Greek colony. The name by which it was known before it became the station of the eighth Roman legion, has long been forgotten; still, however, monuments and ruins are not wanting to attest its ancient splendour. The harbour, twice as large as the harbour of Marseilles, was the largest in Gaul. Agricola, the father-in-law of Tacitus, was born in the same place, now an inconsiderable town, whose inhabitants have to contend against an unwholesome atmosphere and a marshy situation. St. Tropez, on the gulf of Grimaud, at the distance of five leagues from Frejus, is remarkable on the other hand for its salubrious climate. Its harbour is defended by a citadel, and in its dockyards are built the fishing-boats that are used on the coast; it stands on the site of *Heraclea Caccabaria*, well known for its temple of Hercules. Hieres,ⁱ like the last place, is famed for a mild and salubrious climate,^k and also for the excellent oranges produced in the vicinity.

Toulon, it has been said, was founded by the Roman general Telo Martius,^l about the middle of the fourth century; it was famous during the reign of Arcadius for different dyes, particularly purple. The harbour, one of the largest in Europe, is divided into two parts, namely, the old, finished by Henry the Fourth, and the new, constructed by Louis the Fourteenth; they communicate with each other by means of a canal. The careening wharf,^m three hundred feet long and one hundred broad, the rope walk, an arched building 1572 feet in length, the arsenal, the ship yards, the foundery and the sail manufactory are the most important places in the town. Toulon stands near the base of a hill, which commands it on the north. The streets are narrow and the squares irregular; one of the last, however, called the Field of Battle, forms an exception; it is spacious and elegant, and adorned with a double range of trees. The principal balcony in the town-house is supported by two grotesque figures of colossal size, the work of the celebrated Puget; it is said that the artist wished to represent two consulsⁿ by whom he was disappointed in a favourite project. The town was partly destroyed by the Arabs about the end of the tenth century; having been rebuilt by the counts of Marseilles, it was twice ruined in the twelfth century by the Mahometans. The duke of Savoy, aided by the English and the Dutch, besieged it in vain about the beginning of the eighteenth century. The Spaniards and the English, availing themselves of the civil dissensions in France, found bribery and intrigue more successful weapons in 1793; but they did not keep it long; at the end of a few months, they were driven to their ships by the young soldier, who afterwards filled Europe with his fame. The chevalier Paul, who was born in the town, rose in the course of the last century from a very

humble station, that of a common sailor, to be vice-admiral of France.

The country round Toulon is adorned with groves of lemon, olive and date trees, and villas are scattered in different directions. Beyond them on the road to Marseilles, is situated the pass of *Ollioules*,^a a wild valley enclosed by arid heights; in some places, their precipitous and abrupt sides appear as if they were about to fall; in others they are like the ruins of ancient ramparts. The road across the Moorish mountains, so called from the devastations committed by African pirates, as late as the reign of Louis the Twelfth, leads to Brignolles, a small town, situated in a pleasant country. The purity of the air, its position on the side of a hill near the fruitful valley of Calami, abounding in grain and wine, render it perhaps the most agreeable residence in the department. Although it contains several manufactories, the principal trade consists in dried plums, which are transported into different countries. It is said to have been founded before the Christian era; it was the birth-place of St. Louis, bishop of Toulon,^b and grand nephew to St. Louis the Ninth. A rich plain extends between Brignolles and Draguignan, the capital of the department; in the same plain are produced the large chestnuts that are sold in Paris.^c Draguignan is watered by several fountains, and traversed by the Pis, a small river; the principal curiosities are a botanical garden, a good library and a museum of natural history. At two leagues from it, is situated Grasse, a much more important place both in point of population and industry; it stands on the side of a hill, commanding a view of fields and gardens, where the orange, the jessamine and the rose mingle their perfume. Swarms of bees, a source of wealth in that part of the country, find in these and other flowers abundant nourishment, while the inhabitant extracts from them the juices that are converted into liqueurs or essences, and sold in every quarter of the world.

Castellane, now well known for its dried fruits and prunes, is the first town in the department of the Lower Alps on the road from Grasse to Digne. On account of its salt springs, one of which is large enough to turn a mill, it obtained in ancient times the name of *Salina*. Digne,^d an ancient city that Cæsar calls *Digna*,^{e f} is situated in the midst of mountains, that might afford an ample harvest to the mineralogist and the botanist. It consists of steep and narrow streets, enclosed by old walls, and flanked with square turrets. The palaces belonging to the prefect and the bishop, together with the cathedral, are the only public buildings, and they are nowise remarkable. The thermal springs in the vicinity, to which the ancients repaired,^g are visited during the summer and autumn^h by people from different parts of Italy and France.ⁱ The small village of Champtercier near the town, has been rendered famous as the birthplace of the celebrated Gassendi, a philosopher, an astronomer and the rival of Descartes. Colmars may be mentioned on account of a fountain, the water of which flows and intermits alternately every seven minutes. The rich valley of Barcelonette affords pasturage to numerous flocks of sheep, and to many herds of oxen; it derives its name from a small town built in 1230, on the site of a Roman city, by count Raymond Berenger, and as his ancestors had migrated from Barcelona,

the place was called *Barcelonette*. *Segustero*, a Latin name of Celtic origin, announces the antiquity of Sisteron at the confluence of the Buech and the Durance. The river, confined in the town between the two rocks on which the fortress of La Beaume rises, flows rapidly below a lofty arch, to which the same rocks serve as buttments. The principal altar in the cathedral is adorned with a fine painting by Vanloo, and at no great distance from the building, a walk laid out with much taste, leads to one of the gates on the road to Aix.^k Albertet, a Provençal poet who flourished in the thirteenth century, was born in Sisteron; he was still more unfortunate than Petrarch, for he actually died of love; the object of his passion was Laura, the beautiful marchioness of Malespina. It might be difficult to account for the origin of a singular custom that exists in the country between Sisteron and Digne; the peasants wrap their dead in a winding sheet, place them on the roofs of their huts, and cover them with snow, during winter. Claudius Tiberius Nero, sent by Cæsar into Narbonensis, founded there a small town, called *Forum Neronis*, on the site of which stands Forcalquier, the capital of a subprefecture, a dirty and ill built town on a rock, commanded by the ruins of an ancient castle.

Several ancient monuments have been observed in the same department; an inscription on a rock near Sisteron, informs the antiquary that Dardanus and Neva Gallia, his wife, introduced the custom of interring the dead in vaults at *Theopolis*, the present village of Theoux. A bridge attributed to Cæsar, and a building called the tower of *Ænobarbus*, are still seen near the village of Cereste, five leagues distant from Forcalquier. The ruins of several ancient temples are situated near the small town of Riez.

The department of the Mouths of the Rhone^l contains too a thousand objects, which recal ancient recollections. In the neighbourhood of St. Remy, are observed a triumphal arch erected to Marius, and a mausoleum fifty feet in height. Aix, formerly the capital of Provence, was founded a hundred and twenty years before the vulgar era by the consul Caius Sextius Calvinus, near the mineral springs which he himself had discovered, and on account of which he gave the name of *Aque Sextiæ* to the town. It became soon afterwards a place of importance; the emperor Tiberius raised a temple there to the memory of Augustus; it had its senate and a body of decurions.^m Many objects of antiquity have been discovered in the same place, the most of which are collected in the town-house. Several edifices are remarkable for their sculptures and architecture, which are connected with the rise of art in modern times. Such is the cathedral, of which the baptistery, constructed with the remains of a Roman temple, forms one of the most beautiful ornaments. The town-clock near the fountain in the market-place, was erected during the middle ages; it is curious on account of its mechanism; springs put in motion different figures, every time the hammer strikes the bell. The streets are paved, and many of the houses are well built. The Orbitelle, a public walk, is formed by four rows of trees, and adorned with several fountains. The counts of Provence resided at Aix, and made it the seat of a court, where gallantry and politeness reigned, where poetry was

^m The senators of the Roman colonies were called decurions (*decuriones*.) Adam's Rom. Ant. p. 79.—P.

admired and cultivated, and where the troubadours were respected. It is still a university town, where students may find ample means of instruction; it possesses an academy, schools of law and theology, several scientific collections, and a library of 80,000 volumes. In 1819, the mayor laid the foundation of a monument in honour of king René, whose memory must be forever dear to the people of Provence; but if the inhabitants were to raise monuments to each of their celebrated townsmen, the walks and public places might acquire additional interest from the statues of Tournefort, Vanloo, Adanson, Vauvenargues and Entrecasteaux. The glory which these distinguished men shed over the town, may console it for having given birth to the president D'Oppède, whose sad celebrity is still preserved in the annals of fanaticism. The procession on Corpus-Christi day attracts many idle persons to Aix; it is a strange medley of sacred and profane ceremonies, of saints and devils with long horns; in fine, a ridiculous masquerade, in which the principal characters are sustained by the clergy and municipal authorities. The procession was abolished during the revolution, and afterwards renewed; but it would have been well to have discontinued part of the ceremonies, inconsistent with the ideas of the age, and the respect due to religion.

The country in the neighbourhood of Marseilles announces a populous and commercial town; it consists of cultivated fields, gardens, vineyards, and country houses or villas, of which the number is not less than 5000. Surrounded with manufactories, and built on the declivity of a hill, and in a plain that extends to the sea, its situation cannot be compared with that of any other town in France. The old town on the declivity, may give the stranger an unfavourable idea of the place; the finest part of Marseilles is that nearest the sea. Sailors of every nation are seen on the quay; the streets in the same quarter are broad, straight and well paved; a public walk extends round one of the best harbours in the kingdom, sufficiently large to contain twelve hundred vessels, and the noisy centre of the trade which France carries on with the east. The castle of If, an ancient state prison, is the most striking object in view from the summit of Notre Dame de la Garde, but the spectator may also observe institutions and edifices, of which the inhabitants are justly proud, such as the schools of hydrography, medicine, drawing and music, the seminaries where chemistry, geometry, and the mechanical sciences in their application to the arts, are gratuitously taught, the college, the observatory, the mint, the exchange, and the lazaretto, the largest and the best regulated in the kingdom. At the sight of such institutions, one naturally remembers the celebrated *Massilia*, which Cicero called the Athens of Gaul, and Pliny, the mistress of the sciences (*Magistra studiorum*.) It was the native town of Ptolemy, the satirist, Puget, the sculptor, Dumarsais, the grammarian, and Barbaroux, the conventionalist. The climate of Marseilles would be delightful, if the calmness of the atmosphere were not disturbed by the impetuous *mistral*. To the influence of the same wind have been attributed, probably by a stretch of the imagination, the violent character of the people, and their ferocity and cruelty in the time of the revolution.

^b "Arrondissement."

^c See the Memoir on the ancient republic of Arles by Anibert.

^d The papal palace, situated near the summit of the Rock of Dons

The island of Camargue may be seen from the road that leads to Arles; it is surrounded by the sea and by two branches of the Rhone; it contains nine villages, a great many country houses and nearly three hundred and fifty farms, on which the proprietors or tenants rear annually 40,000 sheep, 3,000 oxen, and as many horses. The royal sheepfold of Armilliere is situated in the island. Arles, the ancient *Arelas*,^a one of the capitals of Gaul, is now the chief town of a district^b in the department of the Mouths of the Rhone. Although thinly peopled and ill-built, it may be considered one of the most remarkable cities in France, both on account of the historical associations connected with it, and the remains of ancient splendour. It is supposed to have been built by the Celts, fifteen hundred years before the Christian era;^c its name has been derived from two Celtic words, *ar* and *lait*, which signify *near the waters*. The antiquary may still perceive several arches and two columns of a theatre, the remains of an amphitheatre in a good state of preservation, the tower of Constantine's palace, a granite obelisk, the only one of the kind in France, besides tombs, altars, statues and other remains which are almost daily excavated. The only modern edifice, worthy of being cited, is the fine town-house erected by Mansard. The trade of Arles consists in the sale of the wines, corn, fruits and oil, produced in the surrounding country. The small town of Tarascon stands on the left bank of the Rhone, by which it is separated from Beaucaire. It is commanded by an ancient castle, formerly a country seat belonging to the counts of Provence, and afterwards changed into a prison.

The course of the Durance from the place where it joins the Verdon to its confluence with the Rhone, separates the last department from that of Vaucluse. Broad and majestic, and rapid as a torrent, the river covers the country with its inundations, but the fertile ooze it deposits, and the canals it supplies, compensate in some measure the waste it occasions. At a short distance from the Durance, and on the banks of the Rhone, Avignon rises in a fruitful plain, embellished with mulberry trees, orchards and meadows. The streets of the city are narrow and crooked; the palace of Crillon, and the ancient apostolic palace^d are two fine Gothic buildings; the cathedral may be remarked for its portal, which is said to have belonged to an ancient temple of Hercules. The useful and charitable institutions are more numerous than might have been expected from the number of inhabitants. Among others there are an hospital, an infirmary,^e a collection of paintings, a museum of natural history, a botanical garden, different schools, a library of 27,000 volumes, and a literary society, called the academy of Vaucluse. It is unnecessary to mention the gaiety of the inhabitants, or the grace and beauty of the women, rivalling or surpassing the fair in most towns of the south; it may be remarked, however, that the low and ignorant part of the community, the same persons that committed in 1815, crimes only equalled by those of the revolution, are now making advances in different branches of industry. Avignon was the native place of the brave Crillon, Vernet, the Abbé Poulle and several men who have shed a lustre on the society of the Jesuits. The town is the mart of the grain produced in

an eminence rising to the height of several hundred feet in the midst of the city.—P.

^e "Succursale des Invalides"—military hospital subordinate to the *Hôtel des Invalides* at Paris.—P.

several of the southern departments; it has also manufactories of silks, cottons, leather and paper. *Avenio*, the ancient name, is of Celtic origin. Pomponius Mela says that in his time the inhabitants were very wealthy.

Apt, a place not less ancient than the last town, was embellished by Cæsar, and bore the name of *Apta Julia*; the present walls are said to have been founded by the Romans. Many ancient remains are contained in the subterranean chapels of the old cathedral; it is watered by the Calavon.

Carpentras, another ancient city, surrounded with old walls, was the *Carpentoracte* of the *Memini*, a tribe of the *Cavares*; it would be much improved if the streets were straight. It was the metropolis of a bishopric, which continued from the third to the nineteenth century; the columns of the principal church, formerly the cathedral, supported the temple of Diana in the burgh of Venasque. The remains of a triumphal arch are situated in the courts of the episcopal palace; it was erected to commemorate the victory which Domitius Ænobarbus gained over the Allobroges and the Arverni. The hospital, the different markets, the public laver, the gate in the direction of Orange,^a surmounted by a lofty tower, and the modern aqueduct, consisting of forty-eight arches, thirty-six feet in width, and forty-five in height, are ornamental to the town. It possesses different manufactories, and carries on a trade in wines and other products of the department.

The celebrated fountain of Vaucluse, one of the finest springs in Europe, is situated at an equal distance from Avignon, Apt and Carpentras. It issues from a large and deep cave at the base of a high hill, that bounds on the south the narrow and winding valley of Vaucluse (*Vallis Clausa*.) An old fig tree below the roof or arch of the cave, serves to indicate the height of the water in the fountain. When it is at the greatest elevation, occasioned by the melted snows about the vernal equinox, it bathes the roots of the tree; the vault or arch of the cavern is then no longer visible, and the calm waters occupy a large basin, almost circular, about sixty feet in diameter. The waters are lowest in the month of October, when they descend to the depth of forty feet below the edge of the basin. The vault of the cave then appears in all its majesty, and the spectator may observe a lake of which the extent is lost in total darkness. Many have descended the sides of the basin to the surface of the limpid water, that fills an abyss, of which the depth has never been measured. Extensive subterranean canals placed above each other, are the passages for the waters formed by the melted snows. Twenty torrents are precipitated with a tremendous noise below the basin; their united streams are the sources of the Sorgues,^b which becomes suddenly navigable for boats, and turns several mills. A majestic column was erected on the edge of the fountain in 1809, by the academy of Vaucluse; it bears the following simple inscription in golden letters—*A Pëtrarque*.^c The naked rocks that encompass the cascade, the pyramidal masses on the right and left, the green sward that covers the neighbouring heights, the old turreted castle on the left bank of the Sorgues, according to tradition, the residence of Petrarch, the verdant trees that shade the river, and the village of Vaucluse, are

some parts of a landscape not inferior to any other in the kingdom. A thousand echos respond to the names of Petrarch and Laura; the sympathy of the young and the fair may console the shade of the poet for the cruelty of his mistress.

Mount Ventoux, near the northern extremity of the department, remains covered with snow eight months in the year. The small town of Vaison at some leagues westward, stands on the ruins of *Vasio*, the principal city of the *Vocontii*. Orange, seven leagues south-west of the last place, contains several manufactories, spinning looms, print fields and madder mills;^d it also carries on a trade in wine, oil, honey and saffron. Before it was taken by Louis the Fourteenth, it was the capital of a principality belonging to the house of Nassau. Before Cæsar's expedition into Gaul, it was one of the four principal towns in the territory of the *Cavares*. Ptolemy designates it by the name of *Arausio*^e *Cavarum*. A triumphal arch at the distance of four hundred paces from the walls, on the road to Marseilles, may bear a comparison with any in Rome. It was erected to commemorate the victory gained by Marius over the Cimbri.

The Rhone forms a western limit throughout the whole length of the department of the Drome; the road on the banks of the river first traverses Pierre-Latté, a small town of which the name signifying a large stone,^f may recal the ancient worship of the Druids, or it may be attributed to the large rock at the foot of which it is built. The agreeable town of Montelimart at five leagues northwards, is encompassed with walls and ramparts, watered by several canals, which supply different manufactories, and commanded by an ancient citadel. It is surrounded with fine meadows, fruitful plains and hills covered with excellent vineyards. The four gates that lead to the town correspond with the four cardinal points. Faujas de St. Fond, a learned professor, who promoted the study of geology, was a native of Montelimart. Valence is situated on the other side of the rapid Drome. It is the chief town of the department, and the residence of the prefect, and although built without regularity, contains some monuments not unworthy of notice; among others, a fine mausoleum in the cathedral, erected by Canova to the memory of Pius the Sixth, who terminated his days at Valence in 1798. The building called the Government House^g is not inelegant in point of architecture. It might be worth while to visit the citadel, were it for nothing else than to enjoy the view along the Rhone, or on the west, towards the mountains of Vivarais. The same city is mentioned in the writings of Ptolemy; it was the *Valentia* of the *Segalauni*. Championnet, a general, who distinguished himself by his victories during the revolutionary period, was born in the town. Die, the ancient *Dea Vocontiorum*, according to the Table of Peutinger, and the Itinerary of Antonine, and a place famous for muscadine wine, stands on the right bank of the Drome, in an agreeable valley enclosed by two chains of mountains, of which the northern is connected with Mount Embel, and the southern with Mount Volvent. Nyons in the southern part of the department, on the banks of the Aigues, carries on a trade in soap, woollen stuffs and silk. The bridge over the river was built by the Romans.

^a "La porte d'Orange"—Orange gate.

^b Sorgue.

^d "It possesses manufactories of printed cloths, and also silk mills and madder mills."

^e *Arausio*.—P.

^f "Pierre large."

^g "Gouvernement."

A road across the mountains leads to the small town of Scres, on the banks of the Buech, the first in the department of the Higher Alps. The place called *La Batie Mont-St.-Leon*, within a league from its walls in the direction of Gap, is the ancient Mount Scleucus, where in the year 353 of the vulgar era, Constantius gained a complete victory over Magnentius. At a league from Gap, the capital of the department, the peasants show strangers the *Trembling Meadow*,^a a small floating island in the lake of Pelhotiers, formed like every other of the same description by a congeries of vegetables, the surface of which has been changed into a sort of soil, and covered with grass. Gap stands on the site of *Vappicum* or *Vapincum*. Its name announces its early origin; but laid waste by the Lombards and the Arabians, and overthrown by earthquakes, it rises on the ruins of its ancient buildings. The remains, which indicate how much it has fallen, can only be discovered by digging to a great depth. The plague by which many were destroyed in 1630, the revocation of the edict of Nantes which annihilated its industry, and the almost general conflagration in 1692, when it was taken by the duke of Savoy, have reduced the population to less than half the number it possessed in the sixteenth century, when it contained 16,000 inhabitants. It is ill-paved, ill-built, and without any remarkable edifice; indeed, it can only be commended on account of its agreeable position on the banks of two rivulets, the Bonne^b and the Luye, in a small plain bounded by mountains that form a natural amphitheatre. Embrun,^c called *Eborudono* in the Itinerary of Antonine,^d was the seat of a bishopric.^e The episcopal palace is a fine building, but inferior to the cathedral, which, it is said, was erected by Charlemagne. *Eborudono* was the principal city of the *Caturiges*; Nero and Galba conferred on it important privileges, and Valens rendered it a military station.^f

Passing through Montdauphin, a small stronghold^g of five hundred inhabitants, we may follow the road on the banks of the Durance, leave Mount Genevre on the right, and arrive at Briançon, the highest city in France. It was the *Brigantio* of the Romans, under whom it rose to some importance;^h at present however it is so thinly peopled, and so ill built, that it need only be mentioned on account of its impregnable position. It is defended by seven forts that command all the approaches to the town. The Durance, an impetuous torrent, flows at the foot of a precipice 170 feet in height, and separates the town from the principal fortifications which are partly excavated in the rock above the river; a bridge consisting of a single arch 120 feet in width, thrown over the abyss, forms a communication between the fortress and the town. The trade of Briançon consists in woollen and cotton goods, and also in different articles of cutlery.ⁱ

It has been said that there are four climates in the moun-

^a *Pré qui tremble.*

^f "Nero granted it the right of the Latins (*Jus Latii* vel *Latinitas*.) Galba that of alliance, and Valens rendered it an important military station."

^g "Place forte"—fortified town.

^h "It was ranked among cities of the second order."

ⁱ "It has manufactories of hosiery, cotton goods and hardware."

^k "The mountainous department of the Isere presents several remarkable peculiarities. Four different climates may be distinguished,

namely, those of the arid and the marshy plains, and those of the vallies and the mountains.^k The first are subject in summer to excessive heat and violent winds—the second are exposed to a humid but less elevated temperature. In the deep vallies the variations of the atmosphere are very rapid, still rains and droughts are often of long continuance; during summer, the heat is extreme, while in winter, the cold is very rigorous. Only two seasons, those of summer and winter, are known on the mountains; the latter lasts longer than the former. Among their inhabitants, are observed the same activity and the same industry for which the mountaineers in other European countries are remarkable. The high part of the country is ill provided with wood, but the abundant pastures compensate in some measure for the want of forests; the peasants are thus enabled to rear numerous flocks. The lofty woods in the eastern districts of the department, furnish fuel, timber for building, and masts for ships.

The road which leads from Briançon to Grenoble, extends across a mountainous country, and follows the windings of the Romanche from La Grave, the last village in the Higher Alps, to Vizille, a burgh of no great size, but important on account of its manufactures.^l The forges and iron works that are scattered on the same road, indicate the metallic wealth of the mountains. Leaving the wild and romantic banks of the Drac on the left, we observe the Isere pursuing its sinuous and rapid course at the foot of a chain of heights, covered with vineyards and mulberry trees at their base, and with forests and pastures towards their summits. The same river waters the valley of Gresivaudan, and passes through Grenoble. The lofty ramparts of the town command a fruitful plain, varied with orchards and meadows. The principal public buildings are situated in the part of the town on the left bank of the Isere.^m Among these are the palace of the prefect, and the court of justice. The library belonging to the universityⁿ contains sixty thousand volumes, besides many valuable manuscripts, among others, the poems of the duke of Orleans, the father of Louis the Twelfth. The statues of Bayard, Vaucanson, Condillac and Mably, all natives of Grenoble, are erected in the college. In the schools of law, medicine and surgery, other men, still living, have been educated, who have given proofs of talent sufficient to merit one day a place near the distinguished persons already mentioned. The town carries on a trade in different articles, particularly in gloves, which are said to be the best in France.^o History attests its antiquity; it was the *Cularo* of the ancients;^p ruined in the wars of the Romans, it was rebuilt by the emperor Gratian, who gave it the name of *Gratianopolis*, which has been corrupted into Grenoble.

The burgh of Sassenage, well known for excellent

namely, those of the arid and the marshy plains, and those of the vallies and the mountains."

^m Nine tenths of the city are on the left bank of the Isere.—Ed. Encyc.

ⁿ "College"—Grenoble possesses a university and a royal college.—P.

^o "Its commerce and manufactures are important; among the latter, that of gloves has few rivals in Europe." The principal manufactures of Grenoble are woollen cloths, muslins, hats, and particularly gloves, the principal towns of France, Spain, Italy, and Britain, being supplied with them. (Ed. Encyc.)—P.

^p "It was one of the cities of the Allobroges, who gave it the name of *Cularo*."

cheese, is situated at the foot of the mountain that rises on the west of Grenoble. Strangers visit there two grottos, rendered famous in past times by popular superstition; with-in them are two cylindrical excavations, called the Vats of Sassenage,^a in both of which the water rises spontaneously, and according to the height it reaches, the peasants used to presage the scarcity or abundance of the harvest. These grottos, well worthy of being seen, are not so frequently visited at present, probably because imposture works no longer on ignorance and credulity. A rugged and difficult path leads to them; the entrance is about twenty-five feet broad, and as many in height; beyond it, a sort of porch forty feet wide and seventy long,^b terminates in several caverns; the torrent of Germe issues from the largest, and forms a cascade, of which the noise is heard in the subterranean cavities.

Although the direct distance to the frozen summits of Mont Blanc exceeds twenty-five leagues, they may be distinctly seen from the heights above Grenoble. The Great Chartreuse^c lies in the same direction, a monastery formerly considered the capital of the rich and rigid order founded by St. Bruno in the year 1084. It has taken its name not from the founder, but from the village of *Chartreuse*, situated near the valley, where the pious anchorite chose his retreat, and where his disciples built their convent. It is enclosed at the two extremities by mountain-passes extending between rugged and almost vertical cliffs covered with fir trees and brambles; in certain seasons of the year, particularly in spring, those who visit it must be prepared to brave dangers at every step; enormous rocks rising on the right and on the left afford but an insecure support to other rocks that are lost in the clouds. The precipices are in some places, more than four hundred feet in perpendicular height; the voice of the guides and the cries of animals are drowned in the noise of torrents. The stranger must traverse a narrow pass below the cataract of Guiers-Vif, on the slippery declivity of an immense rock, that separates the mass of water from the abyss into which it descends. These difficulties, almost insurmountable while the snow melts, cease generally about the middle of summer. But the journey in every season is very fatiguing; a winding road encumbered with large stones or broken rocks terminates in the obscurity of a forest, in which the traveller ascends constantly until he observes the convent; the road then begins to descend, and the valley becomes broader, and at the same time the forest opens, and the fir gives place to the beech. An edifice of a simple and noble architecture in such a situation, is not likely to be seen for the first time without feelings of devotion. These walls were respected at the revolution, when religious houses were destroyed. The people in these mountains have not forgotten the blessings which the successors of St. Bruno diffused among the poor; they furnished employment to every inhabitant, they encouraged agriculture, and they changed part of a desert into meadows and fruitful fields; under their superintendance, the forests were preserved, the flocks multiplied in the vallies. Now set-

^f In the year 1670.

led again in their ancient residence, if they no longer possess the influence which was acquired partly by their wealth, they still retain an ascendancy that must be attributed to exemplary virtue, benevolence and charity.

It may not perhaps be worth while to describe all the remarkable places in the neighbourhood of Grenoble; a few detached features may suffice to give the stranger some idea of the country. The hamlet of Andrieux in the valley of Godmard is so much concealed by steep rocks, that the inhabitants never see the sun during three months of winter. When the luminary appears for the first time after so long an absence, all the people, according to an ancient custom, follow the oldest person^d to a bridge in the vicinity; every person carries an omelet, and the return of the sun is celebrated by dances. As soon as it appears, the omelets are presented as an offering; the band then returns to the village, and the festival terminates in mirth and drinking.^e The burgh of Echelles to the north of the Great Chartreuse, stands near the limits between France and Savoy, and not far from the excellent road cut through the rocks by Charles Emmanuel,^f and improved by Napoleon. At a greater distance, Pont de Beauvoisin on the banks of the Guiers, is the last town in France. La Tour du Pin is situated on the same road, in a fertile valley. Near the village of *Notre Dame de la Balme*, on the left bank of the Rhone, the entrance to a cave has been changed into a chapel, and dedicated to the Virgin. The interior consists of several halls adorned with beautiful stalactites, and with cascades, canals and a small lake, where strangers may sail in a boat by the light of torches; and if it were not that the place was sanctified, for it belongs to the chapel, the boat might be compared to the one in which the shades of heathens are transported to the infernal regions.

Confined between the left bank of the Rhone and a series of heights arranged in the form of an amphitheatre, and watered by the Gere, which gives motion to machinery, Vienne, consisting formerly of dirty and winding streets, has been lately embellished with many new buildings. The modern front of the town-house adorns the principal square; the portal and nave of the ancient cathedral are works of considerable merit. The town possesses a library of 12,000 volumes, a theatre, a college, a museum of natural history, and a collection of valuable antiquities, discovered within the walls. It was the *Vienna* and *Vindobona*^g of the ancients, and had risen into importance in the time of Cæsar;^h Strabo styles it the capital of the Allobroges;ⁱ Ptolemy considers it their only city,^k and Pliny calls it a colony.^l According to Pomponius Mela, it was one of the most opulent cities in Gaul. Literature was cultivated, and the poet Martial congratulates himself on the success which his writings met with in the town.^m Under the reign of Claudius, the prefect of Gaul, and the commander of the fleet, which the Romans kept on the Rhone, resided at Vienne. The emperors built a palace in the town, and it was there that Valentinian was strangled in the year 392. It became the capital of the Burgundian

kingdom in 432; but the Franks made themselves masters of it in 534. It was taken in the year 871 by Charles the Bald, after a siege that lasted several months. Pope Clement the Fifth, in presence of Philip the Fair, assembled within the walls a council, memorable in the history of fanaticism, for the unjust condemnation of the Templars. In the time of Eusebius, Lyons and Vienne were the two most important metropolitan cities in France; the archbishop of the latter town was long entitled first primate of Gaul. If the edifices for which the place was remarkable, have been destroyed, it may be attributed to the blind zeal of the early Christians, and the devastations occasioned by war: still, however, there are the remains of a theatre, the ruins of an aqueduct and an amphitheatre, a temple dedicated to Augustus, and a triumphal arch. The church of Notre-Dame de la Vie is an ancient edifice, supposed to have been the *Prætorium*. According to several antiquaries, the bridge which serves as a communication between the town and the suburb was built by the Romans, as well as fort Pipet; but some parts of the latter are evidently of Gothic architecture. The most celebrated persons born in Vienne are the poet Claudian and pope Guy,^a surnamed Clement the Fourth. Now the capital of a prefecture, it holds some rank among the manufacturing towns in France; it has cloth manufactories and iron works, and carries on besides a considerable trade in leather.^b La Côte de St. André, a populous burgh, near the banks of the Frette, derives great profit from the sale of liqueurs and light sparkling white wines. St. Marcellin, well built and agreeably situated, is enriched by the produce of the neighbouring vineyards.

The Ardeche has given its name to the department which it traverses in an easterly direction, and which it also bounds on the south near its confluence with the Rhone; the same department is limited on the east, in the direction of its length, by the Rhone, while on the west, the chain of Mezin,^c and the mountains of Sone and Tanargue, form part of the frontiers. Thus within the same limits was almost wholly contained the ancient province of Vivarais, which long before the invasion of the Romans, was called *Helvia*. In conformity to an etymology, that may be admitted, because it accords with the nature of the country, the ancient name of the province might signify *a road in the mountains*.^d But etymologists have certainly gone too far in deriving the name of the Ardeche from the same root as the Latin word *ardere* (to burn). To suppose that the mountains of Auvergne and Vivarais, almost all of which bear the marks of igneous origin, emitted flames when man inhabited those regions or other neighbouring countries, is to indulge in conjectures wholly at variance with facts. Not the least important of these facts may be considered the discovery of the fossil bones belonging to different animals under the basaltic currents near Issoire in Auvergne,^e—bones in which nothing has been found to announce the existence of man at the period when the basalt covered the place where these remains were deposited. If the ancient names of certain mountains accord with the notion of their ignition, it is because they preserved their heat,

^c From *mezing*, a word in the old patois, which signifies middle.

^d In the ancient Celtic languages, *hel* and *bel* signify elevation, height, and *ria*, like *weg*, a way or road.

smoke or other signs of incandescence, long after the flames had disappeared, or because the dark colour of volcanic products leads the most ignorant persons to compare them with objects which have undergone the action of fire. Thus basalt,^f an eastern word, signifies burnt stone, from its dark color, although the ancients applied that name to a rock, which they did not consider a lava, and which in reality differs from the basalt of geologists.

The physical geography of the same department is less understood than that of almost any other in France. It owes its peculiar character to the volcanic conflagrations, of which it was once the theatre, and to the decomposition of the rocks in many parts of its granitic and calcareous mountains. The crater of St. Leger, not far from the banks of the Ardeche, exhales like the Grotto del Cane near Pozzuoli, a great quantity of carbonic acid. The Pont de la Beaume,^g a volcanic current, exhibits a mass of basalt, arranged in the form of prisms, inclining in different directions, and resting on a range of larger prisms, placed vertically the one beside the other. But the most curious part of the hill is a natural grotto, formed and surmounted by prisms regularly fashioned into an arch, as if by the hand of man. The mountain of Chenavari rests on a calcareous base, supporting a stratum of rolled pebbles, and is crowned by a volcanic summit, which forms a barrier of grey and reddish lava towards the south, and presents in the opposite direction the singular spectacle of a basaltic colonnade more than six hundred feet in length. At a greater distance northwards, a rock surmounted by prisms heaped horizontally, or grouped in an inclined position, supports the ancient castle of Rochemaure, now in ruins, so called from the black colour of the stone. The burgh of Vals is celebrated for its mineral waters; near it may be seen the famous Giants' causeway (*Chaussée des Géans*) formed by many basaltic prisms that rise above both banks of the Volant. A cataract near the bridge of Bridon falls in foam from similar rocks. It is impossible to behold these objects with indifference; but others not less remarkable, are situated in the same department; such are the majestic collection of prisms near the bridge of Rigodel, the stupendous causeway formed by colossal pillars near the village of Colombier, and lastly, the *Gueule d'Enfer*, a waterfall that rushes from a granite rock more than five hundred feet in height, covered with prismatic lava. These volcanic mountains have been frequently described with more or less exactness and particularity;^h it is, however, unnecessary to enumerate all the objects in the same part of the country, which have been mentioned by different authors, under the enticing head of natural curiosities or wonders of nature. Among those not of volcanic origin, the natural bridge of Arc above the Ardeche has given rise to much speculation. It is formed by a semi-circular arch a hundred and ninety-five feet wide, and ninety or ninety-five in height,ⁱ opening a passage through a calcareous rock, that extends across a fruitful and romantic valley. The geographers who mention it, suppose it to have been formed by a rupture made in the rock by the waters of the river, and finished by the hand of man,

^e See p. 883.

ⁱ "60 metres in width, and 25 or 30 in height."

because since the time of the Roman conquest, it has been used as a passage from the Cevennes to Vivarais.^a But so large a rock, instead of having been perforated by the river, must have determined its course in a different direction. It is evident also that it never has been perfected by manual labour; for owing to the inequalities of its upper surface, no one can cross it without the greatest difficulty. It is also certain that the Ardeche has not enlarged it, for the arch exhibits no marks of aqueous abrasion; the bridge must therefore be considered a real cavern, like other caverns formed in the same rock on the banks of the river by natural disintegration; indeed its tendency to disintegration serves as a character for that sort of limestone, whence in the language of geology, it is termed *cavernous*.^b The grottos near the burgh of Vallon, may be attributed to the same cause; they are remarkable for the singular and varied forms which their stalactites present; the rocks near Ruoms, on the other hand, are not less remarkable for their regular shapes, either cubical or pyramidal.

The geologist and the painter may find ample scope for their respective pursuits in the same department, but several places well worthy of being visited, are almost unknown. Such is the domain of Ubas, occupying a circumference of nearly seven leagues. It lies in the western extremity of the department, in the district of St. Etienne de Lugdarès, at eight leagues north-west of L'Argentiere, and surrounded on the north, the east and the south by hills, which rise gradually, and form the volcanic mountain of Prasoncoupe, about 3250 feet^c above the level of the Mediterranean; the name of the mountain signifies *the cup or crater of the meadows*,^d so called most probably on account of the fruitful meadows below it. The same volcano, from the abundance of its lava, may be considered the most important in Vivarais. If the geologists, who have examined the neighbouring country, had observed it, the first rank would not have been assigned to the volcano of Loubaresse. The thermal springs that rise in the neighbourhood, account for the wealth in the village of St. Laurent les Bains; if it were not for the reputation in which the waters are held, it might remain deserted in its narrow and sterile valley. The scene changes at the summit of Prasoncoupe, and lands covered with woods, meadows, abundant streams and cultivated fields, form a contrast to the arid and dismal valley. The worthy descendant of the ancient family, to whom the domain belongs,^e has set an example that the landlords in the department would do well to imitate; he has improved agriculture by introducing the methods adopted in different districts in Switzerland and Alsace, and by crossing the oxen with the best herds of Berne. It were to be wished that such improvements were generally adopted in a country, that appears to have made little or no progress in agricultural knowledge since the thirteenth century. The domain, like all the western and northern part of the department, abounds in granite and sandstone; it contains besides rich iron ore, coal, clay well adapted for earthen ware, and the finest kaolin for porcelain.

The summit of the volcano of Loubaresse commands the valley of Valgorge; its numerous peaks and fruitful fields,

and the frequent contrasts between cultivated nature and romantic scenery, render it the most picturesque in Vivarais. It was in the castle of Valgorge, near a small town of the same name, in the most fertile part of the valley, that the Marquis de La Fare composed the poems on which his celebrity depends. Although the mines of argentiferous lead are now exhausted at L'Argentiere, it finds in its silk manufactures more resources than ever it obtained from the works from which the name of the town has been derived. The town of Bourg St. Andeol to the south-east, on the banks of the Rhone, contains twice as many inhabitants as L'Argentiere, although the latter is the chief town of a subprefecture.^f It has been affirmed that the town was called after St. Andeol, who suffered martyrdom in the third century. On a rock in the neighbourhood from which the Tourne, a fountain of cold mineral water, escapes, is situated a religious monument of the Gauls, namely, the ruins of a temple, which appears to have been consecrated to the god Mithra. Most of the *basso-relievos* are nearly effaced, but one of them, perhaps the most important, remains in a good state of preservation.^g It is not difficult to distinguish a bull with a dog biting it on the neck, and a man holding it by a rope; a radiated figure above the same group represents the sun. Two monuments of a similar kind may be seen in the royal museum of antiquities at Paris; they have been illustrated by French antiquaries. Aps, the *Alba Helviorum* of the Romans, and the ancient capital of Helvia, was ruined by the Goths; it is now a mere village. The inhabitants of Villeneuve de Berg in the vicinity, rear an immense number of silk worms. The same town was the birthplace of Court de Gebelin, one of the greatest philologists of the last century, and whose researches on the languages and monuments of antiquity are among the most valuable. Viviers on the banks of the Rhone contains two thousand souls; it was formerly the capital of Vivarais.

The granite and gneiss that bound the department on the north-west, the sandstone and schistus that rest on these rocks, the limestone that reposes upon the two latter, and the volcanic belt that terminates suddenly on the banks of the Rhone in the basalt of Rochemaure, as if the river had been a barrier to the torrents of lava, meet near Aubenas, where alluvial deposits occasioned by the erosion of the vallies which intersect the other formations, form a very fruitful soil. It might be said, judging not only from the walnut, chestnut and mulberry trees, but also from the vineyards and crops, that few parts of France are so productive; thus Aubenas, a town of 3500 inhabitants, is the mart for the chestnuts and wines of the Ardeche, and a fair to which many persons resort, is held twice a year in the same place for the sale of silk. Privas, the capital of the department, is not remarkable for its edifices; indeed, with the exception of a prison, it possesses none of any consequence; the importance of the town depends on the commerce and industry of the inhabitants. The village of Cornas and the burgh of St. Peray, at no great distance from the Rhone, are encompassed with fruitful and valuable vineyards. The course of the river leads to Tournon, which communicates with Tain on the opposite bank by means of a suspension

^e The family of Agrain des Ubas has possessed it since the eleventh century. ^f Bourg St. Andeol is in the sub-prefecture of Privas.—P.

^g "Among several bas-reliefs, nearly effaced, the most important is that which indicates the purpose for which the temple was erected."

bridge, that is neither so light nor so elegant as others in the neighbourhood of Vienne. An old castle that rises above the town, was built in the time of Charles Martel; it is at present only remarkable for the extensive view it commands along both banks of the Rhone; on the right and in the department of the Drome are seen the famous hill of Hermitage, and the vineyards of *Côte-rôtie brune* and *Côte-rôtie blonde*; the trade in these wines is principally carried on at Tournon. The ruins of an old bridge are situated on the Doubs in the neighbourhood; according to different writers, it was built in the time of Cæsar. The first iron wire bridge made in France, was erected at the small town of Andance. Annonay, well known for its fine paper, is the most industrious town in the Ardeche, a pre-eminence, owing partly to its position at the confluence of the Cance and the Deume. It possesses in addition to the paper mills, cloth, silk and cotton manufactories, bleach-fields, wax and leather works.^a The population amounts to 8000 individuals. It was the birth-place of the virtuous Boissy d'Anglas and of Mongolfier, the inventor of the balloon and the hydraulic ram. Two monuments raised to the memory of these distinguished men, attest the gratitude of their fellow citizens, but reflect little honour on the artists by whom they were executed.

The department has produced several great men, but it cannot be remarked without pain that the mass of the people both in the country and in the towns are as uncultivated as their mountains, and as superstitious as the ancient Helvians from whom they are sprung. The climate of the same department is very different in different places. A fructifying heat is felt on the banks of the Rhone; the vallies round St. Julien and Annonay are temperate, but in the Cevennes on the west, winter lasts nearly eight months, and the ground is often covered with deep snow.

Conterminous to the department of the Ardeche, and traversed by the same chains of mountains, the department of the Upper Loire exhibits the same volcanic phenomena, as wild scenery, and as romantic beauties. The Mezin,^b a mountain of igneous origin, is adorned with majestic columns of basalt; it rises to the height of 2600 feet^c above its granite base. The volcanoes called the *Tartas*,^d the *Infernals* and the *Mouns Caou* or *Mont Chaud*^e are the most remarkable among those which are situated on the same line as the Mezin.^f Basaltic currents appear to have obstructed the course of the Loire at Goudet and at Solignac, and of the Allier at Monistrol, Prades and Chascz. The volcanic rocks take at Pradelles a north-west direction, and they may be discovered near Lonjac, Poulaquet, La Voute, Brioude and Blesle; the currents of lava that flowed from them, appear to have been broken or cut by rivers. Conical masses of scoriæ rise in several places above the basalt; the Bard^g near Allegre, one of the most remarkable of these masses,

^a "It also possesses manufactories of cloth, establishments for spinning silk and cotton, and for bleaching wax, and tanneries."

^b "Mont Mezin."

^c "800 metres."

^d This name has some analogy to the Tartarus of the ancients. M. B.

^e The Hot Mountain.

^f A very apposite remark, which has been already made by different writers, may be here repeated; it is that the names of the volcanoes in Vivarais and Velay are not of Roman origin. Cæsar observed that there was a great analogy between the dialect spoken in these countries and the Latin, as if the latter was derived from it. In this manner it is easy to account for the resemblance which the names mentioned in the text, bear to words of the purest Latinity. Thus *Tartas* or *Tartarou*, and *Infernals* or *Infernès*, may serve to recal the Latin words *Tartarus* and *Infernus*, whilst *Coueron* is not unlike *coquere* (to boil), and *Tanargue* resembles *Tonitru ager* (the field of thunder).

^g "Le Bois de Bard"—the wood of Bard

^h "1150 metres."

reaches to the height of 3737 feet;^h the traces of a lake long since dried up, are still apparent on its truncated summit.ⁱ The site which the lake of Bouchet occupies, is considered an extinct crater; it is about ninety feet in depth, and nine hundred in diameter,^k and is surrounded by four hills of scoriæ. But the most singular volcanic rocks in the department, are the rock of Corneille, rising like an enormous cube in the neighbourhood of Puy, that of Polignac covered with the ruins of an ancient castle, that of St. Michael, exhibiting the appearance of a round tower, and the *Roche Rouge*^l at a league and a half from Brives, a volcanic pyramid more than a hundred feet high, encompassed with a belt of reddish granite seven feet in breadth, and mixed with granite blocks which stud its surface from the base to the summit—a curious example of the action of subterranean fire by which its products have been forced upward through the superincumbent rocks. If it were certain that the hand of man had not contributed to its regularity, the *natural temple*, as it is called, might merit a particular notice; a current of lava near the village of Goudet on the banks of the Loire, has assumed the most capricious forms, such as a round tower terminated by a conical roof, and the peristyle of an edifice supported by columns, thirty feet in breadth and a hundred and eighty in height.

Different mineral substances are found in the primitive and secondary districts; granite, serpentine and marble are rendered useful, and excellent mill-stones are extracted from the beds of sandstone near Marsanges, Navogne and Returnac; coals of the best quality are worked at Frugerès, but the department possesses enough of that mineral to furnish an annual supply of 11000 chaldrons for a period of 600 years.^m Sulphuret of antimony is found in beds or in veins in the districtⁿ of Brioude, and several places abound apparently in sulphuret of lead.^o One or two remarks on the principal towns may enable the reader to estimate the commerce and industry of a department from which more than three thousand individuals emigrate every year, and find employment as tradespeople or workmen in the different French towns.

Puy,^p the ancient capital of Velay, is finely situated in a picturesque valley, watered by the Loire and by two small rivers, the Borne and the Dolaison; it stands at the base of Mount Anis, which terminates in the volcanic rock of Corneille. The streets are so steep that the noise of carriages or waggons is never heard; the lava with which they are paved, and with which the houses are built, gives it a gloomy and dismal appearance. There is no town in France where religious ceremonies are more strictly observed, or where more time is lost in unnecessary and tiresome forms.^q The rock of St. Michael, in the lower part of Puy, is commanded by a church to which the people ascend by a stair of 260

ⁱ On its summit is situated the Crater of Bar, which is almost perfect, 1660 feet in diameter, and 130 feet in depth. It appears that a lake once existed there, but it is now nearly dried up. Daubeny's *Descript. of Volcanoes*, p. 40.—P.

steps cut in the solid rock. The cathedral stands in the highest part of the town, and a lofty flight of 118 steps leads to its portico. The situation of the building, its architecture and the height of its pyramidal steeple, render it one of the most majestic Gothic monuments in Europe. The front is adorned with a sort of mosaic, and the interior appears like a large chapel, in which the vault is formed by the junction of several cupolas. The most valuable relic is a miraculous image of the Virgin—a small cedar wood statue, according to tradition, carved by the Christians of Mount Lebanon, and brought to France in the eighth century, but more probably a figure of Isis, which the pious crusaders mistook for the mother of Christ; at all events, it is begirt with fillets after the manner of Egyptian statues. But as it has long been an object of veneration, it may be considered a Christian relic; several popes and eight or ten kings of France have prostrated themselves before it. The tomb of Duguesclin, which adorns the former church of the Dominicans, the theatre, supposed to have been an ancient temple of Diana, and the museum of natural history are not unworthy of notice. Cardinal Polignac, the author of the poem of Anti-Lucretius, and Julien the sculptor were born in the town; it is now the capital of the department, and it possesses several manufactures, particularly different sorts of lace, and for more than a century has furnished horse-bells to the waggoners and muleteers in the south of France. The neighbouring village of Expailly is known to mineralogists from a stream, in which sapphires, garnets and hyacinths are found. Among the ruins of the ancient castle at Polignac raised on the site of a temple, consecrated to the Celtic Apollo, may be seen the head of the god, carved on a disc of white marble that serves as a cover to the aperture of the cave from which the Gallic divinity used to deliver his prophecies. The small town of Craponne in the same district^a carries on a trade in cloth and lace. Yssengeaux is the seat of an agricultural society; it has also a valuable lead mine in its vicinity. Brioude, at no great distance from the Allier, is situated in a fruitful district.^b

A chain of mountains extends from east to west, and the highest part of it, or the Lozere,^c gives its name to a department. The mountains of Margeride traverse it from south-east to north-west, and the heights of Aubrac are divided into two principal branches. Three rivers, the Allier, the Lot and the Tarn rise in the same country; they are embellished with waterfalls, whilst rugged rocks and wild scenery attest the desolation occasioned by subterranean fires. The Pas de Souci on the Tarn, is formed by two hills almost touching each other at their summits; it would seem as if they waited for the hand of man to unite them, and thus erect a bridge 1800 feet in height: in one place the waters are engulfed between two immense rocks, the Aiguille and the Roc-Sourde; repelled by these barriers, they resume their course, and make the air re-echo with their noise. The abundance of water renders the department humid, and the mountains lengthen the duration of winter. Spring and autumn are generally rainy seasons; storms are not uncommon in summer, but the heat is rarely oppressive. The soil does not produce enough of corn or wine for the con-

^a " Arrondissement."

^b It has an elegant church. M. B. There are two towns of this name, about half a league distant from each other, viz. *Vieille-Brioude* or *Brioude la Vieille* (Old Brioude,) on the Allier, with a lofty bridge of a single arch, and *Brioude-l'Église*, so called from a chapter of canons, all of whom are of noble descent. Encyc. Method. The latter is the one mentioned in the text.—P. ^c Mount Lozere, p. 878.

^d " The town is surrounded with a boulevard."

sumption of the inhabitants. The wealth of the country consists in its mines, which yield silver, antimony and lead. Cattle and woollen stuffs form the two principal branches of its commerce.

Mende, the capital, is situated in the centre of the department; the valley in which it stands, is intersected by a great many streams that water the villas and country seats in the vicinity. The town is encompassed with ramparts;^d the streets are crooked, but adorned with several fountains; the cathedral is remarkable for the boldness of its steeples. The serge manufactured at Mende is exported to the north and south of Europe. Pope Urban the Fifth was born in the neighbourhood of the town, which, it has been affirmed, was the *Anderitum* of the Romans.^e Chateaufort de Randon, a burgh in the mountains to the north-east of Mende, contains hardly 2500 inhabitants; it was formerly a strong place, and a town of some celebrity from the siege which the English maintained against Duguesclin in 1380. The Frenchman died beneath its walls, and the English general, who promised to surrender if he did not receive assistance within a certain time, laid his sword and the keys of the town on the coffin of his adversary. The same year in which that event took place, an act of heroism was achieved near the village of Luc on the eastern frontier of the department, by the ancestors of some families now existing. The English had invaded Gevaudan and Vivarais with a considerable force; murder and desolation indicated their march, until it was suddenly impeded at the fort of Luc, which commanded the road into Upper Auvergne. Two thousand men attempted to besiege it, but three brave knights,^f to whom the fief belonged in common, defended themselves so valiantly that they at last repelled the enemy. The English, however, were ashamed of their defeat, and returned to the contest, when the three knights must have perished, had they not been unexpectedly reinforced by ten of the most intrepid proprietors in the neighbourhood,^g by whose assistance they gained a decisive victory. The castle of Luc is still remarkable for its antiquity; according to ancient chronicles and popular traditions, it was founded before the country was conquered by the Romans. Langogne, a small place of 2500 souls, possesses different cloth manufactories. The village of Bagnols les Bains is much frequented on account of its mineral waters.^h Marvejols, destroyed by the duke De Joyeuse, and rebuilt by Henry the Fourth, is a neat town with broad and straight streets. Florac in a narrow valley on the left of the Tarnon, is surrounded with meadows and fruitful fields, but derives little advantage from its situation.

Three streams, known by the name of Gardon, rise on the eastern declivity of the Cévennes, namely, the Gardon d'Anduse, the Gardon de Mialet and the Gardon d'Alais, so named from the principal places they water. Their junction forms the Gard, also called the Gardon, which gives name to a department;ⁱ its waters sometimes disappear under beds of gravel, but its destructive inundations make the labourer pay very dear for the pieces of gold it brings along with it. Alais, watered by one of the branches already mentioned, is considered a very ancient town; it

^e *Anderitum* occupied the site of Javols or Javault, an inconsiderable town, five leagues N. W. of Mende. D'Anv. Vosgien.—P.

ⁱ The department of the Gard

suffered much during the persecutions^a in the reign of Louis the Fourteenth, but these injuries have been repaired; it is well built, has several manufactories, and carries on a considerable trade in raw silk and ribbons. Near the burgh of Remoulins, the impetuous waves of the Gard rush through a narrow pass, traversed by the Pont du Gard,^b a majestic Roman aqueduct, which conducted the waters from the fountain of Aure to the *naumachia*^c in the ancient *Nemausus*.^d Formed by three rows of arches, it extends to the distance of 600 feet, and rises to the height of 160. The same monument is in excellent preservation; it is difficult to observe it without admiring the ancient Romans, who, wiser than the moderns, employed their soldiers during peace in useful labours. Uzès, the ancient *Ucetia*, is surrounded with high hills; it was formerly the seat of a bishopric, but that did not prevent the inhabitants from embracing the reformation in the sixteenth century. At present it is a place of some trade; its manufactures consist of hosiery, silks, pasteboard and paper.^e It was the native town of the learned Abauzit. Bagnols lies in a fruitful country on the banks of the Ceze; it may be considered on the whole an ill-built town, although a square encompassed with arcades forms an exception; it was the birthplace of Rivarol. A citadel built by Louis the Thirteenth may still be seen at Pont St. Esprit, a town which is also remarkable for a fine bridge, almost half a mile in length,^f begun by St. Louis, and finished in the reign of Philip the Fair. It may be also observed that the same bridge rises at a place where the course of the Rhone is so rapid, that a spectator in a boat below it,^g has hardly time to observe the arches, before they recede from the view. Roquemaure on the right bank of the river, although small, is an industrious town; the inhabitants possess silk manufactories, brandy distilleries and hydraulic saws;^h they make more than 20,000 casks every year for the produce of the vineyards in the vicinity.

Nîmes,ⁱ situated in a fruitful plain, encompassed with hills, is important as the capital of a prefecture,^k and as the seat of a bishopric and a court of justice.^l Learned societies and numerous schools have been established in the town. The few streets that are straight or well built, are confined to the suburbs. Confined within a narrow enclosure, the air is only pure on the ramparts and glacis;^m these fine public walks are shaded with trees; the court of justice,ⁿ a very elegant building, is the greatest ornament of the one; the other is embellished with modern houses, the hospital and the theatre.^o The cathedral contains the tombs of Cardinal Bernis and the celebrated Flechier. But these edifices, creditable to any modern town, shrink into insignif-

icance when compared with the monuments of the Romans. The *Maison Carrée*^p, a rectangular building, as high as it is broad, stands near the theatre; the front is equal to thirty-six feet, and the length to seventy. It is an ancient temple with Corinthian pillars, built by Adrian, and since repaired by two kings of France, namely, Louis the Fourteenth and Louis the Eighteenth.^q The amphitheatre, which has been recently cleared from the buildings and rubbish that encumbered it, forms an elliptical enclosure of 1080 feet; it is surrounded with a hundred and twenty arcades, divided into two rows, the one above the other. It holds about 17,000 persons; bull-fights are sometimes exhibited in the arena. A triumphal arch, called the gate of Cæsar, is one of the ancient monuments most recently discovered;^r the northern gate is also of Roman construction. Many sculptures, basso-relievos and ancient tombs are seen in the town. The *Tour Magne*,^s a seven-sided pyramid,^t rises beyond the walls; the base is about 245 feet in circumference.^u The fountain of Diana and its Roman baths retain only their names to verify their antiquity. The remains of the temple consecrated to the same divinity,^v consists of several capitals, cornices and inscriptions. The foundation of the town is attributed to the Phocæans of Ionia. From the time when it bore the name of *Nemausus* to the present day, Nîmes has produced many distinguished men; among others, the emperor Antonine, Domitius Afer, the master of Quintilian, John Nicot, who first introduced tobacco into France, Bourguet the naturalist, Samuel Petit, the erudite Seguiet,^w Saurin, Villars, John Fabre the protestant, who suffered punishment in place of his father, who had been condemned to the galleys on account of his religion, and lastly, the learned but unfortunate Rabaud-Saint-Etienne.^x Nîmes contains at present a great number of manufactories, and carries on a considerable trade in the products of the department. The medicinal plants and others used in dying, collected by the peasants, form a lucrative branch of exportation; they may be seen in the markets of Amsterdam, Hamburg and Lubeck.

Beaucaire, probably the ancient *Ugernum*, is situated at the distance of five leagues to the east of Nîmes, on the banks of the Rhone, which separates it from Tarascon. The streets are narrow, but in other respects it is a well-built town. The commercial importance of Beaucaire depends principally on a fair, which lasts from the 22d to the 28th of July at midnight; during these six days, there is as much activity and confusion as at Leipsic, when merchants repair to it from every part of the world. As the season of the fair approaches, the Rhone is covered with boats con-

^a "Dragonnades"—After the revocation of the edict of Nantes in 1685, Louis XIV. attempted to compel the Protestants by force to renounce their faith and embrace the Catholic religion. For that purpose he built a citadel at Alais in 1689, and that he might combine spiritual persuasion with temporal power, founded there a bishopric in 1692.—P.

veying the manufactures of Lyons, Germany and Switzerland; at the same period, vessels arrive at Toulon and Marseilles, laden with the merchandize of Italy, Spain and the Levant. A hundred thousand merchants repair from different points of Europe and the East to the fair, where they are crowded in a town of ten thousand inhabitants. The houses can contain only a small part of the extra population, but the extensive meadows on the banks of the Rhone are covered with tents.

Aigues-Mortes, a small town of 3000 inhabitants, situated in a marshy country, is no longer a port, although St. Louis embarked there on his unfortunate expedition to Palestine. It derives its wealth from the immense salt works of Peccais, situated in an arid and sandy district. Vigan,^a a small place at the western extremity of the department, is the capital of a subprefecture; it is watered by the Arre, and only worthy of notice as the birthplace of the chevalier D'Assas.^b The bronze statue that serves to perpetuate the memory of the same person, was exhibited in the Louvre in 1828; it now adorns his native town.

The department of the Gard does not abound in metals or minerals; it contains, however, antimony, coal and lignite, the last of which yields sulphate of iron and alum. The grain harvests are insufficient to supply the consumption, but the vineyards yield three times the quantity of wine that is used in the country. The excess, either in the form of wine or distilled into brandy, together with silk, olive oil, wool, and other articles already mentioned, make up the exports of the department.

The department of the Herault is still poorer than the last in mineral substances. The people work coal, marble, salt and lignite, the last of which, under the name of fossil ashes, is used as a manure. It produces more grain than it consumes, and the great excess of wine, dried fruits, liqueurs, perfumes and oil, form exports of considerable value. The river which gives its name to the department, rises in the Cevennes, at the foot of the high mountains of Egoual and Esperon; it is only navigable for the distance of three leagues, from the burgh of Bessan to its mouth. The course of the same river, from its origin to its junction with the Ergue, may guide us in the description of the country.

Ganges, on the left bank, a town of four thousand inhabitants, is surrounded with country houses, and commanded by an ancient castle. The grotto of the fairies (*la Baouma de las Doumaiselas*), in which the sombre windings are covered with magnificent stalactites, is situated in the neighbourhood. At Aniane,^c a place of less importance than the last, may be seen the ruins of the first convent, built by St. Benedict. Ascending the Ergue, and leaving on the left Clermont de Lodeve^d or Clermont l'Herault, peopled by six thousand inhabitants, who export cloth to the Levant, and carry on a

trade in leather and verdigrise,^e we arrive at Lodeve, the ancient *Luteva*, and the metropolis of a subprefecture, an ill-built town, encompassed with walls, and situated in a fruitful valley. The manufacture of coarse cloths is the principal employment of the inhabitants.^f

A very bad road through a wild country leads from Lodeve to Montpellier.^g The last town stands on a hill from which a magnificent view stretches to the Mediterranean and the Pyrenees. Squares adorned with fountains, no broad streets, but well-built houses, a spacious glacis,^h the Peyrou,ⁱ a fine walk which terminates at an aqueduct, formed by two rows of arches, placed one above the other, the church of St. Peter, the residence of the prefect,^k and the exchange, a very elegant edifice, render it one of the finest towns in the south of France. In the same town, the sciences are taught with zeal, and cultivated with success; it possesses an university, a library containing many valuable manuscripts, an excellent botanical garden, an observatory, several scientific societies, schools of music and painting,^l an anatomical theatre,^m and a celebrated school of medicine, founded in the twelfth century by Arabian physicians expelled from Spain, but received and protected by the counts of Montpellier. It is indebted to M. Fabre, the worthy pupil of David, for a very valuable collection of paintings, both as to their number and selection. It has produced many celebrated men in different branches of knowledge, such as Barthez, Broussonet,ⁿ Fizes, Fouquet and Baumes^o in medicine, Peyronie the founder of the academy of surgery at Paris, Rondelet the naturalist, Magnol, who may be considered the inventor of natural methods in botany, Cambon, who distinguished himself in the troublous times of the revolution by restoring order to the finances,^p Cambaceres, whose talents have never been disputed, and who rose to the first offices of the empire, Roucher, the author of the poem of the Months,^q the celebrated painter Bourdon, and Vien the master of David.^r It is unnecessary to describe in detail the curiosities of Montpellier; one or two remarks may suffice. The marble chair on which the professor^s sits in the amphitheatre of the medical school, is an ancient monument, that was found in the amphitheatre at Nimes. Although the names of the ancient and modern buildings are the same, it might have been as well that the chair had remained in the ancient;^t but the same remark is not applicable to an old bronze bust of Hippocrates, now placed in the hall of the celebrated school. The walk of Peyrou terminates in a six-sided pavilion; within it is a basin supplied by the aqueduct already mentioned, and from which the water falls in cascades over artificial rocks, till it terminates in a lower basin.^u The botanical garden, at no great distance from these places, cannot be observed without interest; it was the first of the kind in France, that was formed for the

purpose of naturalizing plants remarkable for their rarity, beauty or utility. It contains not less than eight thousand plants, and the manner in which it is laid out, renders it an agreeable walk. The admirers of Young's Night Thoughts may repair to a thick shade, below which is an obscure vault, that contains the tomb of his daughter Narcissa. Commerce and the useful arts are cultivated in Montpellier as successfully as the sciences; the manufactures of the town consist in cottons, muslins and cloths, and also in verdigrise and other chemical products. The hospitals and other charitable establishments are well regulated; the mount of piety cannot be too much commended; such institutions, notwithstanding their name, are in most places usurious and fatal to the poorer classes, but in this town at least, their philanthropic purpose has been preserved, and money is advanced on pledges to the poor without interest.

Lunel, a town of 5,500 inhabitants, near the eastern limits of the department, is situated in a country famous for muscadine wines. A cavern in the neighbourhood has been frequently visited by geologists;^a in an alluvial deposit, the fossil bones of different gaminivorous animals, such as wild boars, stags, horses, oxen, and others no longer found in our climates, as hippopotami and camels, are mingled with the remains of lions, tigers, bears and hyenas; it is proved too by the marks of teeth on the bones of the former, that they have been devoured by the latter. The wines in the district of Frontignan,^b about six leagues to the west of Montpellier, rival those of Lunel. Cette, which ought to be written Sette, because it stands upon Mount Setius,^c a height mentioned by Pomponius Mela,^d guards with its fortifications the entrance into the canal of Languedoc.^e Built in the form of an amphitheatre between the sea and the lagoon of Thau, the last of which yields a great quantity of salt, and possessing a fine harbour, accessible to large ships, it contains ten thousand inhabitants, and carries on an extensive trade. Invalids repair to it every year on account of the sea and sand baths. The vertical fissures in the heights near it, are filled with alluvial deposits,^f in which are contained the fossil bones of birds, quadrupeds and reptiles.^g

Beziers rises on a hill that commands a view of a rich valley, where the sad foliage of the olive is united with the verdant leaves of the mulberry, and where gardens, orchards, vineyards and country houses extend along both banks of the Orb.^h In a different direction, may be seen the country watered by the canal of Languedoc.ⁱ The town was the birthplace of Mairan the astronomer. It is a place of great antiquity; it was the *Baterra* of the Romans; although it had been repeatedly ruined by the Visigoths, the Saracens and Charlemagne, it had reached the height of its splendour

when it was sacked in the thirteenth century by Arnold, abbot of Cîteaux,^k during the crusade against the Albigenses. When the monk was about to storm the town, his followers asked him by what signs they might know the catholics,—*Kill all*, said the bigot, *let God discover his own*.^l Agde, formerly *Agatha*, stands near the sea at the base of a volcanic height; it was founded by a Greek colony; the harbour is advantageously situated for the coasting trade; it possesses a hundred and twenty small vessels, and it is peopled by eight thousand inhabitants. Pezenas, which Pliny calls *Piscnæ*, rises to the north-east of Beziers, on the banks of the Herault; the inhabitants carry on a trade in woollen stuffs and in the excellent wines for which the district is celebrated.

The Tarn waters on the western side of the Espinouse and the Black Mountains, a poorer department^m than the one that has been described. The people employed themselves formerly in cultivating woad, but now that the superiority of indigo is acknowledged, the profits arising from the culture of the plant are much reduced. The country is in many places covered with forests, and the timber is exported and used in building; the pastures are abundant, and the produce in grain and wine is more than sufficient for the wants of the people. Coal is the only mineral substance of any importance, and the manufacturing industry is principally confined to cotton and woollen stuffs.ⁿ

Alby^o on the banks of the Tarn, perhaps the worst built archiepiscopal city in France,^p is the native town of the unfortunate Lapeyrouse^q and the brave general D'Hautpoul.^r The walls in the inside of the cathedral are adorned with old paintings. The building itself is remarkable for boldness and elegance. The Lice, a public walk, is formed by a fine terrace commanding a view of an extensive and fruitful plain. *Albiga*, the Latin name of the town, proves it to have been the principal city of the *Albigi*; it was afterwards the capital of Albigeois, a province devastated in the twelfth century by the fanatical Simon de Montfort, and at a later period, during the persecutions in the reign of Louis the Fourteenth. Castres, founded in 647 on the site of a Roman camp, may be considered the most important town in the department, both on account of its manufactures and the number of inhabitants. The residence of the subprefect is the ancient episcopal palace, a very elegant edifice built after the plans of Mansard. The Agout divides the town into two parts, which communicate with each other by means of two stone bridges. It has produced several distinguished men, among others, Rapin Thoyras the author of a history of England, Andrew Dacier the academician, and the learned Sabatier.^s La Roquette, a place in the vicinity, so called from the broken masses of rock which cover

Beauvais.—P.

it, is visited by strangers on account of the *Trembling Stone*,^a and the *grotto of St. Dominic*. The trembling stone, a mass consisting of 360 cubic feet, has been supposed to weigh not less than thirty tons;^b it resembles an egg flattened at one end, and placed on its smaller extremity; it rests near the edge of a large rock on the declivity of a hill; any one may easily make it vibrate, and when once put in motion, the vibrations are distinctly repeated seven or eight times. The grotto that has been called after the founder of the Dominicans, to whom it served as a retreat, is situated at the base of the hill, below the trembling stone; it consists of subterranean galleries about 4200 feet in length, by sixty or seventy in breadth.^c The walls of the cavern are formed by rounded rocks, heaped upon each other in many places with so much regularity that they might be supposed to have been the work of art, not of nature.^d Alby and Castres are the two most important towns in the department; the others are comparatively insignificant. Gaillac rises on the right bank of the Tarn, at the place where it begins to be navigable; the inhabitants find employment in building boats or in making casks, and they carry on a considerable trade in the brandy and wines of the neighbourhood. The village of Lombers is mentioned in history, as the place where a council assembled in 1176, whose decision was the signal for the crusade against the Albigenes, and for the murders committed in Languedoc. The small town of Lavaur possesses cotton and silk manufactories. Bruguiere,^e the capital of a district, contains four thousand inhabitants; it is situated near the Thauré, a small river which loses itself in subterranean cavities, and leaves a part of its bed, equal in length to more than eight hundred yards, always dry.^f The small town of Soreze, peopled by 2500 souls, enjoyed some celebrity in past times on account of a college.^g

The canal of Languedoc passes through the department of the Upper Garonne, a department bounded on the south by the lofty summits of the Pyrenees, and watered by the Tarn, the Arriege and the Garonne, and by not less than fourteen smaller streams. The soil is rich and fruitful; the forests supply the inhabitants with timber proper for ship-building, and the abundant pastures account for the number of the herds. From the mildness of the climate, and the favourable exposure of many hills, the vine has been planted in a great part of the country. The wines, it is true, are not of the best quality, but the quantity is so great that two-thirds of it are exported from the department. The mineral products are various, but not very useful; two salt springs, and the mineral and thermal waters of Encausse, Barthe, and Bag-

neres de Luchon form an exception. It possesses manufactories of iron, steel and different kinds of stuffs.

The Tarn which traverses the northern part of the department, leads to Villemur, the capital of a district, a small, ill-built town peopled by 6000 individuals, and situated near the confluence of the Save and the Garonne. Grenade, a neat and clean town, although consisting of brick houses, was the birthplace of Cazalès.^h

Toulouse, five leagues above the last place, on the banks of the Garonne, was the ancient city of the *Tolosates*, the dominant tribe of the *Tectosages*, a nation that had no inconsiderable share in the distant expeditions conducted by Belovesus, Sigovesus and Brennus. The capital of the kingdom of the Visigoths during several centuries, it became afterwards the capital of the country governed by the counts of Toulouse, and continued so until Languedoc was united to France. The numerous monuments that adorned it, when it was classed among the most important Roman colonies, are now almost wholly destroyed; none can be mentioned except the remains of a small amphitheatre, and a single ancient tomb in the cloister of the old church of the Augustines. Some of the edifices are admired, several modern houses are not inelegantly built; but although a large town, it contains nothing which indicates its ancient splendour.ⁱ Brick buildings are too numerous, and the squares, with the exception of St. Cyprian's, are deficient in regularity. The broad quays give the town an imposing aspect; the Garonne divides it into two equal parts, and is crossed by a magnificent bridge terminating in a triumphal arch, constructed after the plans of Mansard. It is encompassed with walls flanked by two round towers, and nine gates lead to different parts of the city. The townhouse, called the *Capitole*,^k is an old building with a fine modern front; the busts of different persons born in Toulouse are placed in the interior. We may mention those of Cujas the lawyer, Fermat the mathematician, Campistron the tragic poet, Duranti the magistrate, and Clemence Isaure, who founded in 1323 the college of the Gay Science.^{l,m} A fountain adorned with basso-relievos rises in front of the cathedral, of which the choir is the only part finished. The principal institutions in the town are a university, a school of medicine and surgery, a royal college, a botanical garden, a school of artillery and one of horsemanship, an academy of the fine arts with a collection of paintings, a mint, and a royal cannon foundery. Most of the buildings were more or less injured on the sixteenth of April 1816, by the explosion of a powder magazine.ⁿ

ⁱ "Although this large and celebrated city contains many fine residences of the old nobility (*hôtels*), and many modern houses of elegant architecture, it exhibits no traces of its ancient splendour."

^k The Capitol.—The consuls of Toulouse were from this circumstance called *capitouls*. (Vosgien.)—Consuls were certain municipal magistrates in some of the French cities and towns (see Toulon note ⁿ p. 892), corresponding to the *jurats* and *echevins* in others, and to the sheriffs and aldermen in England.—P.

^l "*Guy Savoir*"—*El Gai Saber*, the Provençal term for poetry.—P.

^m This college was erected into the Academy of Floral Games in 1694; the society assembled in one of the halls of the Capitol. M. B.—Clemence Isaure, a lady of Toulouse, who founded the Floral Games in the 15th century. The precise period of her birth and death are

not known; it is only ascertained that she was living in 1478, and that she died not long before 1513. The academy of Floral Games was dissolved in 1790, but restored in 1806. A history of the academy has been recently published by the perpetual secretary, M. Poitevin-Peittavi, entitled: *Mémoire pour servir à l'Histoire des Jeux Floraux*, Toulouse, 1815, 2 v. 8vo. (Beauvais, Dict. Hist.) The academy of the Gay Science (*del Gai Saber*) was founded in 1323, by a number of versifiers who had assumed the name of Troubadours, and who associated themselves under the title of *La Sobregaya Companhia dels sept Trobadors de Tolosa*, "the very gay society of the seven Troubadours of Toulouse." In 1324, the *capitouls* or magistrates of Toulouse, and the company of Troubadours, addressed a circular to all the cities of Languedoc, offering a prize of a golden violet to the author of the best poem in the Provençal language. This was the origin of the Floral Games. The existence of Clemence Isaure is considered doubtful. She is not mentioned in the circulars of the academy, nor in the registers of the magistrates. Sismondi's *Literature of the South of Europe*, vol. I. p. 126, Roscoe's *Trans.*—P.

ⁿ The country in the neighbourhood of Toulouse, is very agreeable; the Canal of Languedoc passes at the foot of the ramparts, and not far from the town is the plain where Marshal Soult signalized himself in 1814, by defeating the Anglo-Spanish army, although three times

The road to Carcassonne crosses a fruitful plain, and passes through the small town of Ville Franche,^a the capital of a district.^b Muret in a valley at the confluence of the Louge and the Garonne, is a place of considerable industry; the people are employed in making fine pottery, or in manufacturing coarse cloth. It is celebrated in French history on account of the siege, which Simon de Montfort maintained against the king of Arragon, who was killed in a sally. St. Martory, the capital of a district,^c is situated in a pleasant valley on the Garonne, which is traversed by a bridge terminated by two triumphal arches. The same town was the birthplace of the priest Vigilantius,^d who flourished during the fourth century, and attempted in vain to reform the abuses that had crept into the church. St. Gaudens on the left bank of the river, is the mart for an extensive trade with Spain. St. Bertrand de Comminges stands on the ruins of *Lugdunum Convenarum*;^e it was formerly an important town, but contains at present hardly 800 inhabitants; they export marble vases, statues and bas-reliefs to different parts of Europe. The mausoleum of the holy bishop whose name it bears, serves as an ornament to the church. At the distance of a league beyond St. Beat, which a strong dike protects against the inundations of the Garonne, the traveller leaves the valley watered by the river, and enters another in which Bagneres de Luchon is situated; at present indeed Bagneres hardly deserves the name of a town, but it may soon do so, if the population continue to increase as it has done of late years. It resembles a triangle, and from the three angles extend as many public walks; one is planted with planes, another with sycamores, and a third with lime trees; the last or the most northern leads to the baths, and is consequently the most frequented. The public baths may be compared to the finest of the kind in Europe; the structure itself has the appearance of a castle. The establishment does not appear to be of very ancient origin, although it is certain that the baths were known to the Romans;^f altars and votive inscriptions have been discovered at different periods. The valley of Luchon is broad in the neighbourhood of Bagneres, and laid out in rich meadows and cultivated fields, which yield often two harvests in the same year; numerous herds and flocks^g are reared in the same part of the country. Mountain passes, fragrant with aromatic flowers, torrents broken by cataracts, and the peak of Maladetta, covered with eternal snow, and situated on the crest of the Spanish Pyrenees, give a lively interest to the excursions round Bagneres. But the stranger is often saddened in the midst of such magnificent scenery by the sight of beings as hideous from the goitres with which they are affected, as from their invariable attendant, moral degradation; they are the true *Parias* of the French Pyrenees; whether men, women or children, all the other inhabitants look on them with disgust, and condemn them to the lowest occupations. Wealth and cleanliness, the companions of industry, tend happily by their progress to diminish the number of these unfortunate persons.

Although the mountains are arid, that extend from the

stronger than his own, and commanded by the Duke of Wellington. M. B. This pleasant specimen of French national vanity has been omitted by the English translator for very obvious reasons. English writers inform us that the Duke of Wellington was completely successful. The battle was fought April 10th, and at the close of the day the French were hemmed in on three sides, the road to Carcassonne being the only one left open. Marshal Soult however succeeded in effecting his retreat by that road on the night of the 11th.—P.

summits of the Pyrenees to the canal of Languedoc, and although the Black Mountains, which rise on the north, and which belong to the chain of the Cevennes, are unfruitful, the agricultural products in the department of the Aude, are more than sufficient for the wants of the people. The principal river which waters it, the canal which crosses it from west to east, and the Mediterranean which washes the coast, have contributed to its commerce, or at least to the activity and industry of the inhabitants. The mines yield comparatively little, but the iron works in the department are not without importance; the people are economical and frugal, and consequently rich; indeed it has been ascertained that the average quantity of wealth belonging to each individual, is greater than in most other departments; the country, however, might be still much improved.

Sostomagus, one of the most ancient towns in southern Gaul, was ruined at the time the Goths invaded France; at a later period it was rebuilt and fortified by the same people, and as they were Arians, it took the name of *Castrum Novum Arianorum*, which has been since changed into Castelnaudary.^h Traversed by the canal of Languedoc, a fine basin enclosed with broad embankments, and shaded with trees, serves as a harbour, and forms a public walk. Charitable institutions and places of industry are not wanting in the town, and the historical recollections connected with it are not without interest. It is known that the count of Toulouse was obliged to demolish the fortifications, when he made peace with St. Louis in the year 1229. The English burnt it in 1355; it was rebuilt and enlarged about ten years afterwards, and it was below the ramparts that Marshal Schomberg at the head of the troops of Louis the Thirteenth, defeated the forces of Gaston d'Orleans, commanded by the duke of Montmorency, who was decapitated at Toulouse. Among the great men to whom it has given birth, we need only mention the learned and brave general Andreossy. It carries on at present no inconsiderable trade in woollen stuffs; the use of modern machinery has been introduced into the manufactories.ⁱ The Aude divides Carcassonne into two parts; the upper town is a wretched and almost deserted place, encompassed with walls, and built on a rock, but the lower town consists of broad and straight streets, and is adorned with several public walks; it possesses a fine harbour on the canal, and among the public buildings may be mentioned the cathedral, the town-house, the palace of the prefect and the barracks. It has been long famous for its cloths;^k it still possesses about forty manufactories, and the cloths are mostly destined for the Levant. Cæsar mentions the town, and calls it *Carcaso*;^l it was the birthplace of Fabre d'Eglantine. On the banks of the Fresquel in the neighbourhood, may be seen a triumphal arch, erected to Numerian.

Limoux on the Aude contains within its walls about twenty cloth and ratteen manufactories. The same river waters the small town of Alet,^m peopled with 1100 souls, and visited by strangers on account of the thermal springs. Narbonne, celebrated under the name of *Narbo*, 300 years

^e It is situated on the Garonne, above St. Gaudens, and was formerly capital of the country of Comminges, originally an independent county, but surrendered to the king of France by the countess Margaret, who died in 1443, when it became a province of the kingdom.—P.

before the vulgar era, and surnamed *Marcius*^a by the Roman consul, who founded a colony there a hundred and fifty years afterwards, is situated on the canal of Robine, which communicates with the Mediterranean by the lagoon of Sigean. The Gothic cathedral is a very fine edifice, and the stranger may observe within its walls, and within the court of the former archiepiscopal palace,^b several Roman monuments in a good state of preservation. It was the native town of Varro, a poet and a warrior,^c of the emperor Marcus Aurelius,^d of Fronto the orator, and of Montfaucon the antiquary. The honey in the district^e forms a branch of exportation.

The eastern extremity of the Pyrenees gives its name to a department,^f watered by the Agly, the Tet and the Tech, which flow for the most part in an eastern direction. The climate is warm; indeed the temperature of winter might be mistaken for that of spring. A favourable exposure unfolds the vegetation of eastern countries; pomegranate trees grow in the hedges, and the fields are shaded with mulberry, olive and orange trees; juniper bushes, thyme, rosemary and lavender grow in the open fields or on the sides of the mountains, and gentle breezes diffuse their fragrance. The vines warmed by the summer's heat yield a great quantity of grapes, and two-fifths of the wine are exported from the department; the best kinds are raised on the hills of Collioure, Salces and Rivesaltes. But the department is not exempt from disadvantages; during the summer season, droughts are not unfrequent, and the rivers, from the inclination of their channels, are left dry; on the contrary, during the rainy season, and the melting of the snows, they inundate their banks, and deluge the plains. It may be also mentioned that the lands near the sea, formed by alluvial deposits, are little better than marshes; the exhalations that rise from them, render several districts very unhealthy, and their effect might be still more deleterious, if the air was not occasionally purified by a north-west wind, which the people call the *Tramontane*, because it crosses the mountains of Corbieres, which extend into the department of the Aude.

Perpignan, the seat of a prefecture and a bishopric,^g rises on the right bank of the Tet, and on the small river Basse. It is situated about two leagues from the sea, at the foot of a hill, and on the site of *Flavium Ebusum*, an ancient municipal city. The old fortifications and the works constructed according to the principles of Vauban were almost entirely rebuilt in the year 1823. The view from the ramparts extends over a magnificent plain, bounded by mountains, and commanded on the west by the snow covered peak of Canigou; in a different direction, several openings in the midst of fruitful hills unfold the expanse of the Medi-

terranean. An inexhaustible spring flows at the base of a lofty citadel. The buildings worthy of notice are the barracks erected by Louis the Fourteenth, which may contain about five thousand men, the church of St. John, the town-house, the court of justice and the exchange. The college, the library, the museum of natural history, and different seminaries are certainly creditable to the town. The royal sheep-folds in the neighbourhood are perhaps the finest in France; it may be regretted that the improvements introduced into so important a branch of rural economy, have not been imitated in other parts of the country.^h

Elne on the left bank of the Tech, a small town of 1200 inhabitants, stands on the site of the ancient *Helena*, or the still more ancient *Illiberis*, a place of some celebrity, for Hannibal encamped under its walls. Ceret, thinly peopled and encompassed with lofty walls, may be mentioned on account of a bridge more remarkable for boldness than any other in France; it rises to an extraordinary height, and consists of a single arch, of which the abutments are built on two rocks; the opening exceeds 150 feet.ⁱ Port Vendre near the frontier, a short distance to the south-east of Collioure, was a small seaport about the end of the eighteenth century, hardly equal in point of population to Collioure; it owes its present importance to Marshal De Mailly, who was then governor of Roussillon.^k He foresaw the advantages it might derive from its position; the harbour was cleared and reconstructed, a basin was dug, which may contain five hundred vessels, and at present Port Vendre is a flourishing and well-built town, in which the market place^l is adorned with fountains and a marble obelisk a hundred feet in height.

It is only necessary to traverse some ravines near the sources of the Tet, to arrive at the vallies where the Arriege^m rises. The department watered by the last river,ⁿ is covered with mountains, forests and pastures; two distinct climates are perceptible within its limits. The southern part, from the elevation of the soil, is exposed to great cold and excessive heat, while the vallies on the north are mild and temperate. Numerous herds are reared in the same vallies, and the soil, although ill adapted for the vine, is very fruitful in corn. The number of iron works, and the quality of the steel made in the department, prove that the industrious inhabitants have availed themselves of the mineral riches in their territory.

The small town of Foix rises in the valley watered by the Arriege, near an ancient castle surmounted by three Gothic towers. The counts that bore the name of the town, appear in the brightest pages of French history, but the monuments of those times are passing away. The

^m "Ariège."

ⁿ The department of the Arriege.

streets are narrow, and the ancient castle is wholly deserted and falling into ruins;^a trade and industry correspond with the insignificance of the population. Tarascon stands in a very picturesque situation at the confluence of the Arriège and a torrent which descends from the valley of Vic d'Es-sos. Ax is famous for fifty-three mineral and thermal springs, of which the temperature varies from 72° to 167° of Fahrenheit.^b Pamiers in the north of the department is surrounded with canals fed by the Arriège, which serve to move many machines; the streets are broad and straight, and the houses well built. Foix is the capital of the department, but Pamiers surpasses it in every respect; it has lately been made the seat of a bishopric.^c The mountain called the Puy du Till stands at no great distance from the small and neat town of Mirepoix; the mountain is remarkable for the cavities contained in it, from which cold and sometimes very violent currents of air escape in every season of the year; the people call the phenomenon, the *Vent de Pas*. St. Girons is the only other town worthy of notice in the department; it stands on the Salat, a small but rapid river, which sets in motion paper mills and different manufactories.^d St. Lizier in the vicinity, formerly the seat of a bishopric, claims vainly the rank of a town; it does not contain 1100 inhabitants, and, as if to afford an example of the vicissitudes in this lower world, the episcopal palace has been changed into an asylum for mendicants.

The ancient county of Bigorre forms almost the whole of the department, which derives its name from the highest part of the Pyrenees.^e The plains are confined to the northern districts; the others are made up of thick forests and verdant vallies, mountains difficult of access, naked peaks, summits covered with glaciers, and lakes fed by melted snows. The torrents or *gaves*,^f which fall in cataracts from the mountains, are the sources of the Adour, the Garonne and other rivers which water the department. He who travels from the confines of the department of the Gers to Mont Perdu, the Mont Blanc of the Pyrenees, passes through almost every climate in Europe; he may observe the vegetation changing gradually from the plants of temperate countries to those of hyperborean regions. No great quantity of corn is raised on the most fruitful soils, but they yield plenty of wine. An active race of men inhabit the mountains; their manner of life may recal the customs of pastoral tribes. The shepherds have their winter and summer residence; they choose the first in the lower, and the other in the higher vallies. Skilful in directing the course of the waters, they are thus enabled to enrich the meadows, which in the latter part of the year, afford nourishment to their cattle. "The same small stream," says Ramond,^g "waters contiguous possessions, the one above the other. A few slates are the simple sluices by which the course of the water may be changed, and made to communicate with neighbouring canals, where, by the same means, it is directed from meadow to meadow, until it reaches the lowest declivities which it is intended to fructify." While the different members of the family are

engaged in cultivating the ground, one man conducts the flocks to the highest mountains, where natural pastures await them; if he cannot find any cave or shelter, he raises a rude cottage with stones and the branches of trees; in autumn, the sheep and cattle are brought down to the summer residence, which the family has left for the village. The shepherd passes the winter in solitude, and his flocks consume the food that has been prepared for them. He braves the rigours of the season, the snows, the hurricanes and the overwhelming avalanche. His food consists principally of milk, but the cows are much inferior both in form and in size to those on the Alps.

We shall commence with the towns in the northern part of the country. Vic en Bigorre,^h a small town on the right bank of the Lechez, is peopled by 3500 inhabitants; it carries on a trade in brandy and leather. Rabastens near the banks of a canal,ⁱ is the small town whose inhabitants were massacred without distinction of age or sex by the troops of Charles the Ninth, after the battle of Montcontour.

Tarbes is situated above these places, on the banks of the Adour; the streets are broad and regular, and the houses are built of brick and marble. A pure air and a cloudless sky, together with fresh and limpid streams, contribute to the salubrity for which it is famed. It is the chief town and the mart of all the commerce in the department; many Spaniards repair to it for the purpose of purchasing cattle. The prefect resides in the ancient episcopal palace; the cathedral rises on the ruins of the castle of Bigorra; the square of Maubourguet, situated in the centre of the town, is adorned with trees, and encircled with coffee-houses and places of amusement, but it cannot be compared with the Prado beyond the walls. Tarbes stands probably on the site of the ancient city of the *Tarbelli*.^k

Bagnères de Bigorre is situated five leagues to the south, and on the banks of the same river; it is the capital of a district,^l and many strangers visit it every year on account of its mineral waters. It stands at the foot of a hill covered with trees and verdure; pleasant walks extend from it through the fine valley of Campan and along the banks of the Adour. Campan, a flourishing burgh, contains about 4500 inhabitants; it is a place of trade; the manufactures are paper and woollen stuffs. Extensive marble quarries and a grotto four hundred feet in depth, adorned with beautiful stalactites, are situated in the vicinity.^m Argelès,ⁿ the chief town of a district,^o is only remarkable for its romantic position in a valley, watered by the Gave d'Azun, which unites with the Gave de Pau. On the banks of the last river, and at the distance of five leagues below Argelès, Lourdes rises on a rock, commanded by a fortress, which was ceded to the English by the treaty of Bretigny, and afterwards changed into a state prison. It is a small town, with manufactories of linen and woollen stuffs, and appears to be of very ancient origin, from the remains of walls and towers of Roman construction. Caunterets, towards the summits of the Pyrenees, is situated near roaring cataracts and foaming streams; it is mentioned in history as the resi-

dence of Margaret of Valois, but its celebrity depends chiefly at present on its mineral waters. The village of St. Sauveur is visited on account of the sulphureous springs in the neighbourhood. The church in the small town of Luz, was originally a convent of the Templars. The thermal springs of Baresges, to which more than 600 strangers repair, vary in temperature from 106° to 122° of Fahrenheit.^a The village is formed by a single street, consisting of eighty houses, and has a chapel, an hospital built by Louis the Fifteenth for disabled soldiers, and extensive baths. Although a pleasant summer residence, it is hardly habitable in winter; most of the inhabitants then repair to Luz, where they remain until the beginning of spring. The famous cataract of Gavarnie, more remarkable than any other in Europe, may be observed in the neighbourhood; it falls from the height of 1270 feet.

The ancient principality of Bearn,^b and Lower Navarre,^c the only remains of the kingdom, which Rome took from the grandfather^d of Henry the Fourth, and granted to Ferdinand king of Arragon, are included in the department of the Lower Pyrenees. A new title, that of king of Navarre, was assumed by the French sovereigns, when a descendant of the house of Bearn mounted the throne of France. The territories of Soule and Labourd^{e f} are also situated in the same department.^g The Pyrenees do not occupy one half of the country; they have no longer the appearance of lofty mountains covered with eternal glaciers, but of heights crowned with forests, and intersected with fruitful and well peopled vallies. Hills planted with vineyards extend at their base, plains rich in corn line both the banks of the Gave de Pau, and the sandy lands on the north, partly uncultivated, but susceptible of much improvement, add to the varied products of the department. The Bidassoa bounds it on the west, and determines the line which separates the kingdoms of France and Spain. In the same river is situated the isle of Pheasants, called also the isle of Conference, from the interview between Mazarin and Lewis de Haro,^h an interview that brought about the treaty by which Artois and Roussillon were ceded to France.ⁱ Although the coasts bathed by the Gulf of Gascony are not extensive, the harbours situated on them, afford great advantages to the commerce of the department; the inhabitants are not solely occupied with agricultural labours; many of them are employed in different manufactories, and in working iron and other mines.

At the period when the Arabs, then masters of the greater

^h Don Luis de Haro, prime minister of Philip IV. of Spain.—P.

ⁱ In the river Bidassoa nearly at the crossing place from Fontarabia to Andaya on the French side, is a small barren and uninhabited island, formerly named the Isle of Pheasants, but being the place where the conference was held between France and Spain, which produced the peace of the Pyrenees, it thence received the name of Isle de la Conference. Tuckey's Mar. Geog. II. p. 74.—P.

part of Spain, extended their devastations beyond the Pyrenees, a prince of Bearn marked with three stakes, the site of a castle, which was afterwards raised to impede their progress. The same edifice, built in the ninth century, was occupied both as a palace and a fortress. The people of Bearn called it *Paou*, which signifies a stake, and from the protection it afforded, houses were grouped round it, and a town was thus formed in the tenth century, which continued to increase and prosper under the government of good and enlightened princes. Such was the origin of Pau, a city built with some sort of elegance, near the extremity of a table-land that commands the fruitful valley watered by the Gave,^k which derives its name from the ancient capital of Bearn. The principal ornaments of the town are a lofty bridge that rises above the river with the majesty of an aqueduct, together with the castle, the court of justice, and a public walk adorned with a fine fountain. Pau is renowned as the birthplace of Henry the Fourth, but it has also produced Gaston de Foix, the celebrated duke of Nemours, Jane d'Albret, who, although queen of a petty state, acted an important part in French history, and the viscount D'Orthès, who in Bayonne, on St. Bartholomew's day, spared the victims devoted by Charles the Ninth;^l it was also the native town of Peter Marca,^m one of the most learned prelates in the Gallican church, of Pardies the astronomer, and lastly, of the general,ⁿ who accepted the Swedish throne, and renounced his country. It may be repeated that Henry the Fourth was born in the castle of Pau, which, during the revolution, was changed into a barrack, and after the restoration, into a royal palace. A large tortoise-shell, once the cradle of the monarch, is preserved with almost religious veneration; other relics of the great and good king are kept with the same care. But Pau has more titles to celebrity than those arising from historical associations; it holds no mean place among the industrious towns in France; the manufactures consist of cloth, carpets and woollen stuffs.^o Nay, situated above it, on the left bank of the Gave de Pau, is a place of some trade;^p it was the native town of Abbadie, a famous protestant theologian.

Oloron or Oleron on the right bank of the Gave d'Ossau,^q carries on a trade with Spain; it sends among other articles into that country, a great many boxwood combs made by machinery; it exports timber for the royal navy, and the wool it receives from Spanish Navarre into different parts of France.^r Mauleon stands in a fruitful valley; it is the smallest capital of a district^s in the department. Orthez,^t

another chief town of a district,^a and a place of greater importance, is well built and commanded by the ruins of an old castle. Jane d'Albret granted it an university,^b and founded a school, in which a trial was made of what has been since called the system of mutual instruction, a system renewed at the present day, and generally believed to be of English invention.^c A destructive battle was fought at the gates of the town in 1814; Marshal Soult, at the head of 20,000 men, sustained the shock of 70,000 English, Spaniards and Portuguese under the command of the Duke of Wellington, who purchased a victory with the loss of 10,000 men. The salt springs near Salies, a small town in the same district,^d abound in salt of a pure whiteness, to which has been attributed the superiority of the hams cured at Pau and Bayonne.^e It was in the last town that the bayonet was invented in the eighteenth century,^f—a formidable weapon by which many victories have been since decided.

Bayonne is the only trading town in France, that possesses the advantage of two rivers, in which the tide rises. The Nive and the Adour divide it into three nearly equal parts, called Great Bayonne, Little Bayonne and the suburb of St. Esprit. The streets are broad and straight; the squares and market places are adorned with different edifices, the finest of which are the cathedral and the exchange.^g As a strong place, it may be ranked in the first class; it is the seat of a bishopric, and the capital of a district.^d Great Bayonne is commanded by an old castle, Little Bayonne by a modern castle, and the suburb of St. Esprit by a citadel, the work of Vauban, which has been since enlarged and improved. The harbour, although difficult of access for large ships, is safe and much frequented by small vessels. Many persons are engaged in the coasting trade and in the cod fisheries. Bayonne rivals Andaye in preparing the liqueur that bears the name of that village;^h it sends chocolate into most parts of France,ⁱ and wines of the first quality are produced in the neighbourhood.

The people in the department of the Landes see the summits of the Pyrenees only at a distance; the Adour and the Lay which descend from those mountains, water fields fruitful in maize and wheat, and the hills on the left are covered with vineyards. But on leaving the Adour, vast plains of sand fatigue the eye by an uniformity which is only broken by ponds, marshes or heaths, and at distant intervals, by meadows and cultivated fields. A long green belt near the sea shore is formed by a forest of maritime pines; the same part of the country is thinly peopled. These monotonous and dismal plains (*landes*) give their name to the department. The peasants live in isolated cottages; the father of the family employs himself in cultivating the ground, or in other rural labours, while the young people often travel ten leagues round the country for the purpose of making char-

coal in the forests, or of leading their flocks to pastures. It might be supposed that the people were wanderers, and not unwilling to quit an ungrateful soil; certainly their great sobriety, their comparatively few wants, and the velocity with which they move along their deserts by means of long stilts, might afford them great facility in removing; but the love of country prevails. The land, however, is not wholly unproductive; the peasant cultivates hemp, makes sail cloth, and derives considerable profit from the resin of his pine trees. The soil abounds in iron ore, and there are not fewer than seventeen places in the department in which it may be smelted.^k

Dax,^l situated on the left bank of the Adour, above its junction with the Lay, may be considered an important town, not from its population, but as being the capital of a district.^m It is well built and encompassed by old walls flanked with towers. The hospital may be mentioned for the excellent way in which it is managed, and on account of the attention bestowed on the inmates.ⁿ It possesses a museum of natural history, containing a fine collection of fossil shells mostly found in the vicinity; some species which are still inhabitants of the neighbouring sea, prove that the sandy plains in the department were covered by the ocean at a later period than the marine deposits round Paris. The thermal springs are much frequented; their mean temperature is about 165° of Fahrenheit.^o The waters are collected in a pentagonal reservoir nearly 25 feet in depth, surrounded with porticos and iron rails. The vapours that rise from them in the morning when the air is cold, form a dense fog, which covers sometimes the whole town. The Romans were not ignorant of the thermal springs in this ancient city of the *Tarbelli*; it was styled by them *Aqua Tarbellica*;^p it is still not unfrequently called *Aqs*, which, as well as its more common appellation, is evidently derived from the same name. It passed from the Roman domination under that of the Goths; the latter were succeeded by the Franks, who were in their turn expelled by the *Vascones* or Gascons. The Arabs took it in the year 910, and the English in the twelfth century; it was freed from the yoke of the latter about the middle of the fifteenth by Charles the Seventh; it carries on at present a considerable trade in the products of the department. It was the native town of Borda, the inventor of the reflecting circle. The small village of Poy in the vicinity claims the honour of having given birth to Vincent de Paul,^q whom the church adores as a saint, and humanity reveres as a benefactor.

St. Sever rises on the left bank of the Adour, at the distance of ten leagues above Dax. It owes its origin to William Sancho,^r duke of Gascony, who, in the year 982, founded there a celebrated abbey of Benedictines. Aire,

^r "Guillaume Sanche."

at the foot of a hill, is the ancient *Vicus Julii*, which was called *Atures* before the reign of Augustus, from the *Atur*,^a the name given by the *Tarusates* to the Adour, that flows below the town. Tartas rises like an amphitheatre on the declivity of a hill; it is watered by the Midouze, a feeder of the Adour; the country in the neighbourhood abounds in tortoises, red partridges and different sorts of game. Lastly, Mont de Marsan, situated near the confluence of the Douze and the Midou, formerly a very insignificant town, has increased in population, since it became the capital of the department. It bears the name of its founder, Peter, viscount of Marsan, by whom it was built in the year 1140. Although not a manufacturing town, its position at the entrance into a vast plain, renders it the principal mart for the trade of the department.

The Leyre, a small river, which rises on the north of Mont de Marsan, and throws itself into the bay of Arcachon,^b serves as a boundary to the department of the Gironde. The sandy plains or *landes* extend nearly to the banks of the Garonne, from which they are separated by the rich vineyards of Medoc, Haut Brion, St. Emilion and Grave; they terminate on the west in sandy downs that stretch along the sea-shore; the particles of sand carried by the wind, covered formerly every year a space seventy-two feet in breadth by fifty leagues in length. The steeple of a church was long seen near the canal of Furnes, while the other parts of the building were buried in the sand. Several houses on the coast of Medoc, have been destroyed in the same manner, and the tops of the highest trees are only observed in an ancient forest near the bay of Arcachon. It was the opinion of Bremontier the engineer, that plants well adapted for such kinds of soil, might be raised on these downs; his advice was followed, and they have since become fruitful.^c The marble monument, which records the memory of the event, and the gratitude of the inhabitants, is now surrounded by cultivated fields. In the country between the Garonne and the Dordogne, the most varied and picturesque sites succeed the uniformity of the heaths. The soil between the last river and the Dronne, which forms the northern limit of the department, consists of calcareous heights, covered with coppice or vineyards, and separated from each other by fruitful vallies. Enriched by agriculture and trade, the people are industrious and enlightened; iron and other mineral substances are worked with profit; flocks of merinos are by no means uncommon on the estates of the wealthy proprietors, and of late years, the best breeds from England have been introduced into the country.^d

The towns situated in the *landes* are poor and thinly peopled; such is Bazas, the capital of a district.^e Although it possesses no other antiquities than medals and mosaics, it

is known to have been an important place in the time of the Romans, who called it *Cossium Vasatum*,^f because it was situated in the territory of the *Vasates*. The diocese, of which it was formerly the seat, must have been very ancient, since one of the bishops was present at the council of Agde in the year 506. The cathedral is a fine Gothic edifice of the fourteenth century. The ruins of the church of Ozeste, another Gothic building, erected by pope Clement the Fifth, may be seen at a short distance from the walls.^g Langon, surrounded by the vineyards of Grave, is better built; it rises on the left bank of the Garonne, where the tide, still perceptible, favours the trade of the town, and the conveyance of its wines. Of late years, steam boats have sailed regularly to Bordeaux, and the communication between the two towns, has in consequence been much increased.

Many islands are scattered in different parts of the river, and the banks are bordered by fruitful hills. On the right bank are situated the old towers and embattled walls of Cadillac, as well as the fine castle of Epéron. Rioux at a greater distance to the north, on the same bank of the river, contains 1500 inhabitants. Castres, on the left bank, near the confluence of the Gué-Mort, is not so important a place as the last, but better built, and is agreeably situated on the road from Toulouse to Bordeaux. The last city rises majestically on the banks of the Garonne, at the place where the river forms a large curve, and renders the harbour very imposing. It describes an arc, of which the two extremities are not less than a league distant from each other, and the space it encloses may contain a thousand ships. Bordeaux^h may be ranked from its commerce and importance among the first towns in the kingdom. A line of fine buildings extends along the whole length of the city,ⁱ and vessels of every size and from every nation repair to the harbour. The mean breadth of the river may be more than a mile;^k it flows with rapidity, and a magnificent bridge, consisting of seventeen arches, erected over the narrowest part of the Garonne, occupies a space equal to 648 yards^l in length. The difficulties against which the architect had to contend in building such a bridge in such a situation, were apparently insurmountable. It was necessary to overcome the obstacles arising from the sandy and shifting bed of the river, from the depth of twenty-five to forty feet,^m from the force of the tide, which twice a-day rises to the height of four or five yards,ⁿ and from the currents occasioned by the same cause, the velocity of which sometimes exceeds three yards in a second. Old Bordeaux extends on the right of the bridge; the streets are narrow and crooked, and the squares and market places are irregular. The quarter of Chartrons is the most commercial part of the town,^o but the finest and best

century. The Gothic church of Ozeste,[†] founded by Pope Clement V. is situated at a short distance from the walls now in ruins (*ses murailles en ruines*.)

† Oreste? Orestes was bishop of Bazas in 585. Moreri.—P.

^b Arcachon.

^c "Since the engineer Bremontier suggested the idea that these downs might be fixed by sowing them with plants suited to the soil, they have been rendered productive." France is indebted to Bremontier for fixing the sands and planting the downs along the Gulf of Gascony, and for restoring those sandy soils to cultivation. (Beauvais.) Since 1788, the government has attempted checking the progress of the downs, by raising pines from seeds on their internal declivities, and as far as the experiment has been tried, it is said to have succeeded. Tuckey's Mar. Geog. V. II. p. 5.—P.

^d "Enriched by its agriculture and a very extensive commerce, the department of the Gironde also contains many manufacturing establishments. Iron is extensively manufactured; there are four high furnaces* and seven fineries† in the department. Many of the wealthy proprietors keep flocks of merinos, and are also engaged in introducing the English long woolled sheep."—P.

^g "The cathedral is one of the finest monuments of the fourteenth

built is the quarter of the Chapeau Rouge. Louis the Fourteenth destroyed the remains of an ancient temple dedicated to the tutelary gods, in order to enlarge the esplanade of the Chateau Trompette; but the castle itself has been destroyed since the revolution, and modern buildings not unworthy of so wealthy a city are now raised on the site.^a All that remains of the old fortifications, now useless, are the ruins of the fort of St. Croix at the extremity of the quarter of Chartrons; the dockyards extend at their base.

The old dungeons^b in the castle of Ha are still entire; they are used as a prison. The Burgundian gate,^c a fine triumphal arch, rises on the quay, opposite the bridge; it was built to commemorate the birth of the grandson of Louis the Fourteenth.^d Another gate near the old trenches of Salinieres, may be remarked on account of the Gothic edifice which rises above it; it is the ancient town-house. The Royal square^e is more worthy of the name from the buildings which adorn it, than from its size. The *Place Dauphine*, more regular than the last, is situated at the extremity of a much frequented walk, called the alleys of Tourny; the other squares worthy of notice, are the *Place d'Armes*, and those of *St. Germain* and *Grands-hommes*. The cathedral, the largest church in the town, is a Gothic edifice; the interior, imposing from its size, is adorned with a magnificent altar. The large theatre, a circular building,^f surpasses most places of the same kind in elegance of architecture, and in the commodious arrangement of the boxes. A light and graceful dome towers above the exchange, the rendezvous for merchants from every part of the world. The ancient archiepiscopal palace, an edifice remarkable for its regularity, was changed into a royal palace at the restoration. Bordeaux, like Paris, has a pompous cemetery, where the wealthy accumulate marbles and inscriptions; it is situated at the extremity of the town, in the enclosure of the new Chartreuse, near a handsome modern church embellished with fresco paintings. Within the same rich city are situated several hospitals, an asylum for the deaf and dumb, different academical societies, and a public library, consisting of 110,000 volumes, among which is a copy of Montaigne's *Essays* with marginal corrections written by the author; it possesses besides, a botanical garden, one of the four established by government for the purpose of naturalizing exotic plants, a collection of natural history, schools of theology, medicine, surgery, drawing and painting, and lastly a

museum of antiquities, in which are tombs and basso-relievos collected in the town or neighbourhood.^g We have had occasion to mention an ancient temple, now wholly destroyed; some arcades of an amphitheatre, called the palace of Gallienus,^h are the only remains that serve to recal the Roman domination. It is supposed that Bordeaux was a town before the conquest of Caesar, and that its ancient name came from two words of Celtic origin, *Bur* and *Wal*, signifying a Gallic fortress, which the Romans corrupted into *Burdigala*. It is by that name that Ausonius mentions it in his verses; it became the capital of the second Aquitania during the reign of Hadrian. It was ravaged by the Visigoths about the end of the fourth century, and four hundred years afterwards, by the Saracens and the Normans; it passed with the whole of Aquitaine into the power of the English in the year 1152.ⁱ It was enlarged under Henry the Second and Edward the Third, but it did not become very flourishing until Charles the Seventh freed it from a foreign yoke. Although it may be doubted that it was the native town of Ausonius and Sidonius Apollinaris, it claims at least the merit of having given birth to Montesquieu, to Berquin, to Ducos and Gensonné, two distinguished members of the national convention, and lastly to the celebrated defender of Louis the Sixteenth,^k whose devotedness was rewarded with the most honourable dignities.

Bordeaux has its distilleries, vinegar, nitric acid and sugar works; it possesses paper, cotton, silk and woollen manufactories: the porcelain, glass, hats, carpets and stockings made in the same place are sold in different parts of France.^l It equips every year nearly two hundred vessels, and of these several are sent to the cod and whale fisheries.

The small town of Blaye, supposed to have been the ancient *Blavia*, is situated below the narrow tongue of land, called the *Bec d'Ambès*,^m on the right bank of the Gironde, opposite Medoc. It is divided into two parts, one of which rises on the acclivity of a hill, and the other on the summit, where four large bastions serve with the fort of Medoc to guard the entrance into the river. According to tradition, Caribert, who died in the year 574, and the brave Roland, who fell at Roncevaux in 778, were buried within the walls of the town. Libourne, the capital of a district,ⁿ is situated at the confluence of the Dordogne and the Dronne; it is encompassed with walls and

^a The Chateau Trompette was purchased from the late king (Louis XVI.) by a company of speculators, for the purpose of being taken down, in order to build with the materials a fine square, and several splendid streets, to the number of 1800 houses. (Ed. Encyc. 1813.)—P.

agreeable walks, and was founded by Edward the First, king of England. La Reole, the last town worthy of notice, rises near the eastern extremity of the department, on a hill which commands the right bank of the Garonne. It was the birthplace of the two Fauchers, both victims of the same political revolution. Twin brothers, and united to each other by the most devoted attachment, their patriotism called them both to the field of battle, where they served in the same ranks, distinguished themselves in the same engagements, and were made generals at the same time. Enthusiastically attached to liberty, they disdained to promote the ambition of a single man; as soon, therefore, as Bonaparte assumed the title of consul, and thereby announced his ambitious designs, they resigned their commissions. Their retirement was ennobled with the laurels of twenty campaigns. But the presence of foreign troops on the French territory after the battle of Waterloo, and the continuance of hostilities after the departure of Napoleon, and the return of the King, announcing the dangers which threatened France, the two brothers accepted from general Clausel, the honourable office of defending their native town, an office which they fulfilled with much zeal and ability until, informed of the state of events, they laid down their arms. Their patriotism was imputed to them as a crime; summoned before a special commission, no advocate was bold enough to defend them. The two brothers were in consequence doomed to death, and as they had been inseparable during life, so they died in embracing each other.

If a traveller were to form an opinion of the soil in the department of the Lot and Garonne from the wide and fertile vallies that these two rivers water, he might suppose it one of the most fruitful in France. But the dismal landes that have been already mentioned, extend on the west, and cover an eighth part of the surface. The hills situated on the east between the Garonne and the Lot, particularly near the banks of the Lot, are by no means fruitful. On the north, the labourer attempts to derive some profit from a ferruginous clay, which covers several districts; it may be truly said, however, that the soil is ungrateful.^a But in the more fertile parts of the country, the corn crops suffice amply for the wants of the inhabitants. Trees of different kinds are loaded with fruit, and it is believed that the best prunes in France are exported from the department.^b The vines, often cultivated with the plough, and suffered to grow without props, yield double the quantity of wine that the inhabitants consume. Most of the wines are red, thick and strong; they may be kept a long time, and are not impaired by distant voyages. Hemp grows to a great height, and judges consider it superior to any in the north; tobacco is cultivated on a great scale,

^a "It may be truly said that in one half of the department, the soil is unproductive."

^b "Plum trees are the most common, particularly those that furnish the excellent prunes called *cates*,* which form an extensive article of exportation."

* Fr. *ente*, a graft.

^c "Iron is the most important of its mineral productions; it supplies three high furnaces, three Catalan forges,† and five fineries."

^g Clerac.

^h "The tobacco manufactory (*manufacture de tabac*), which formerly enjoyed a high reputation, is situated at a short distance from its walls. Clairac on the Lot formerly rivalled it in that article; its tobacco (*tu-*

and it is considered of a better quality than any other sort in France. Iron, the most abundant mineral substance in the department, adds considerably to the wealth of the inhabitants.^c The climate is temperate, the sky is seldom clouded, and the air is salubrious; an exception, however, must be made of the country near the marshes, which cover part of the landes. Long alternations of rains and droughts often interrupt the course of the seasons; sometimes an atmospheric phenomenon, called the *brouillard*^d in the country, changes the joyful days of spring into days of mourning. If the burning rays of the sun are suddenly felt after the light mist which accompanies the same phenomenon, the hopes of the husbandman are blasted.

Marmande was almost destroyed by the Arabs in the eighth century; although many of the buildings are antiquated, it is on the whole, a well built town; it is the chief place in a district^e of the same name; it rises on the right bank of the Garonne, and carries on a considerable trade with Bordeaux. Tonneins consists mostly of a long and broad street, embellished with several fine houses; the inhabitants are industrious, and the town is a place of trade both in the products of the department, and in different manufactures.^f The tobacco works, which were at one time in greater repute than any others in France, are situated at a short distance from the walls. Although its snuff is still much prized, connoisseurs of the present day seem to give the preference to that of Clairac,^g a town situated on the Lot, peopled by about 5000 inhabitants, and one of the first places in the south that embraced the reformation.^h Villeneuve d'Agen, which was built in the thirteenth century according to a regular plan, is traversed by the Lot; the principal arch of a bridge erected at the same period over the river, is 108 feet in width and 55 in height. The old fortifications are now changed into agreeable walks, but some remains of the former may be seen near the castle of Duke Alphonso, the brother of St. Louis, and the founder of the town. No other place of any consequence can be mentioned in the same district.^k Agen, although thinly peopled, is the largest town in the department; its antiquity is attested by the name of *Aginum*,^m given it by Ptolemy, who informs us that it was the capital of the *Nitiobriges*. It obtained the rank and privileges of a city under Theodosius; it is at present the seat of a bishopric and a court of justice.ⁿ The streets are narrow and crooked, and the houses clumsy and inconvenient, but the bridge over the Garonne is a fine structure. The walks are laid out with much taste, and the neighbouring country cannot be too much commended. Agen was the native town of Joseph Scaliger and Lacepede. The inhabitants manufacture hard-ware, sail-cloth and printed cottons. The small but neat town of Nerac on the Bayse,^o

bac) was esteemed the best in France."—For a memoir on the cultivation and preparation of tobacco in the district of Tonneins, see Savary, Dict. Comm. 1741, Vol. III. p. 272, or Encyc. Meth. Commerce, art. *Tabac*. The modes of preparing it were spinning and rolling. The manufacture of snuff is not mentioned.—P.

ⁱ "The first place in the south which embraced the reformation." Gerard Le Roux, abbot of Clerac, about the year 1530, having embraced the doctrines of the reformation, not only brought over the town to his persuasion, but also Margaret, queen of Navarre, who declared herself his protectress. is situated in a picturesque country, and commanded by an ancient Gothic castle, the residence of the kings of Navarre.^a

The department of the Gers, bounded on the north by the one that has been last mentioned, may be considered an agricultural country; although mountainous on the south, large plains extend towards the north; the air is pure and the climate temperate. A seventh part of the surface is covered with vineyards; the rest is laid out in meadows and corn fields. The greater part of the soil yields moderate harvests, and the department furnishes very little good wine, but a great quantity of bad, which the inhabitants convert into brandy, better than any other sort in France, with the exception of that of Cognac. The brandy still bears the name of Armagnac, an ancient province, of which the greater part forms the present department.^b

Condom stands on the Bayse, a river which serves to turn many flour mills in the vicinity;^c it carries on a considerable trade in leather and quills; it was formerly the seat of a bishopric. Several distilleries have been built in the small towns of Cazaubon and Eauze; the name of the last was probably derived from *Elusa*, a city belonging to the *Elusates*, and the metropolis of *Novempopulania*, of which some vestiges are to be found in Ciutat, an adjoining hamlet. The village of Castera-Vivent, situated on the road to Auch, is much frequented on account of the sulphureous springs near it. Auch, the ancient *Climberis*, the capital of the *Ausci*, a people who were subdued by Crassus, is at present the chief town of the department, and the residence of an archbishop, who was formerly entitled primate of Aquitaine.^d Rising like an amphitheatre on the declivity of a hill, and divided by the Gers into the upper and lower town, Auch consists of narrow and winding streets, but the squares and public places are built with greater regularity. The foundation of the cathedral has been attributed to Clovis; it may be admired for the elevation of the vaulted roof, the beauty of the painted windows, which Mary de Medicis wished to remove to Paris, and the elegance of the modern portal, in which the Corinthian order is united with the Composite. A well built square in the upper part of the town, leads to a pleasant walk, from which the view extends to the Pyrenees; for these as well as many other embellishments, the inhabitants are indebted to M. Deigny,^e an individual to whom they have shown their gratitude by erecting a statue. Auch is the native town of the witty Roquelaure, of admiral Villaret de Joyeuse and of general Dessolles. Mirande, the small capital of a poor and sterile district,^f is well built and encompassed with walls. Lombès,^g still more insignificant, but situated in a very fruitful part of the country, has been often injured by the inundations of the Save, which waters it. Fleurance, although it contains only 3000 inhabitants, is adorned with a fine public square.

We traverse a fruitful country, and follow the windings of the Gers, before we arrive at the height which crowns Lectoure, the birthplace of Marshal Lannes. It is not far removed from the site which has been attributed to *Lactora*, a city of the *Lactorates*. It is chiefly worthy of no-

tice on account of the magnificent view from the public walk called the Bastion. The walls that surround it, are erected on the space occupied by the triple enclosure, which defended it in the time of the counts of Armagnac, but which proved no security to the last descendant of that illustrious family, against the vengeance of Louis the Eleventh. John the Fifth, count of Armagnac, was one of those persons who seem to be impelled in the career of wickedness by an irresistible power, and whom impetuous passions render as culpable as unfortunate. The crimes of his father, who revolted against his liege lord, might have deprived him of his dominions, had it not been for the clemency of Charles the Seventh, but the misfortunes of his family, and the proscription denounced against him in early life, were all unavailing lessons. A passion at which nature shudders, was the origin of his misfortunes. Madly attached to his sister Isabella, a lady renowned for her beauty, the publicity of their guilt brought upon him the wrath of the church; but the indignation of Rome was appeased by his feigned repentance. He had hardly been absolved from excommunication and restored to Christian privileges, when he ventured to solicit from the pope, dispensations for marrying his sister, which were peremptorily refused, but two persons suborned by the count, forged them, and the monstrous marriage was celebrated with pomp and solemnity. The chief of the church published a second and a terrible anathema against the incestuous pair. Charles employed persuasion and counsel to restore the count to reason, who repaid his kindness by joining the enemies of France. Lectoure was shortly afterwards besieged by a formidable army; Isabella fled, John could not remain without her, and both hastened for protection to the King of Arragon, their relative. Love, not fear, had induced the count to fly, but singularly inconsistent in his character, he returned and appeared before the parliament that summoned him. Thrown into prison, he made his escape; proscribed, deprived of his dominions, and unable to see her, whom a late but not insincere repentance rendered the most wretched of mothers, he travelled on foot as a mendicant to Rome, and implored for himself, now that his power had vanished as a dream, and for her who was bewailing her crimes in a cloister, the mercy of the holy father; an absolution was granted, but not without the most rigid conditions. Louis the Eleventh put him again in possession of his estates, and he married the daughter of the count of Foix; but equally ungrateful to his new benefactor, as he had formerly been to Charles the Seventh, he conspired against the throne of France. Punished a second time, and driven from his dominions, he was enabled to return in consequence of new political intrigues, which he had formed with the duke of Guienne. He became a third time an exile after the tragical death of the duke, but by new intrigues he made himself a third time master of his capital, and cast Peter of Bourbon into prison, who commanded the town in the name of the king. Louis the Eleventh had now determined to reduce the power of the great vassals of the crown, and the treason of John was not to be passed over with impunity. Tristan

the hermit, and Cardinal D'Alby, marched with their sanguinary troops against Lectoure; the count defended himself bravely, and his son, the fruit of incestuous love, was slain in a sally. Despairing of success, and no match against the king in the number of his men, he offered to surrender on certain conditions. The conditions were accepted; the cardinal and the count partook the sacrament together, and both parties swore on the altar to observe them. However, the troops of the king had hardly entered the town before all the inhabitants were put to the sword; the count fell in the midst of the slaughter,^a and the countess, far advanced in pregnancy, was compelled to swallow poison;^b Charles his only brother, and James d'Armagnac his cousin expiated on the scaffold the crimes of their relative.^c

A new department, that of the Tarn and Garonne, was added to the others, conformably to a decree passed on the second of November 1808; it consists of different districts, which were taken from the adjoining departments.^d It is watered by the Aveyron, which throws itself into the Tarn below Montauban, and by the Tarn which joins the Garonne below Moissac. The Gimonne, the Rats and other streams of less consequence, which traverse it in different directions, serve to enlarge a river often liable to inundations. Fruitful and well cultivated fields are enclosed with hedges, or varied with groves of quince trees.^e The land produces much more wheat than the inhabitants can consume; more than half the wine is converted into brandy, and sent out of the department; the white mulberry tree affords plentiful nourishment to the silk worm; different sorts of poultry are reared in great numbers; and mules prized by the Spaniards, are exported to their country. It is pleasing to observe the reciprocal influence of agricultural and manufacturing industry; thus the consequences of the one are numerous distilleries, silk manufactories and other works of different kinds.^f

Moissac, founded about the end of the fourth century, rises on the right bank of the Tarn, and the navigation of the river facilitates the trade with Bordeaux. Lauzerte, a small town of 5000 inhabitants, stands on a rock in a picturesque situation, at the confluence of the Landou and the Barguelonne. The ancient walls and ramparts that encompassed Castel-Sarrasin^g are now changed into agreeable walks.

Montauban, the most central town in the department, was founded in the twelfth century. It has been affirmed that it received the name of *Mons Albanus* from the great quantity of willows in the vicinity, which the country people call *albas*. It is a large and well built town; the Tarn, which divides it into three quarters, affords an easy communication with Bordeaux, and adds to the importance of its trade.^h The gates, the town-house and most of the public buildings are not inelegant; the cathedral is much

older than the town; indeed it is well known that long before the foundation of the latter, the convent of *Mons Aureolus* stood in the highest part of the present Montauban. It is the native town of Lefranc de Pompignanⁱ and other distinguished men.

It is said that queen Brunehaut had a castle at Bruniquel on the left bank of the Verre, where the lower orders find at present employment in working iron.^k Negrepelisse was a flourishing town, before it was burnt by the troops of Louis the Thirteenth.^l Cossade,^m St. Antonin and Caylus are small towns of four or five thousand inhabitants, who manufacture serge and coarse cloth, dress leather,ⁿ and carry on a considerable trade in the corn and wines of the department.

Mounts Espinouse, Garriguen and Aubrac, and some branches of the Cantal extend over almost all the surface in the department of the Aveyron;^o vast forests cover their declivities, and the snow remains on their summits six months in the year. Thus, although a southern department, the climate is cold in some places, particularly in the northern districts; in others where the temperature is milder, wheat is in general not the most common sort of grain. Not less than a third part of the land remains uncultivated, but the harvests are sufficient for the wants of the inhabitants. The vineyards, confined to the eastern part of the country, produce as much wine as the people can consume; if, however, the wines of Agnac, Laucedat and Marcillac be excepted, all the others are of an ordinary quality. But the wealth of the department consists in fruitful meadows and pastures, which afford the means of rearing horses, mules, oxen, goats, and nearly 600,000 sheep. The cheese of Roquefort, which the inhabitants export to most countries in Europe, is made of the milk of the ewes, mixed with a small proportion of the milk of the she-goats. The different metals in the same department are still unworked, but it contains besides extensive coal mines and quarries of aluminous schistus; the produce of the last in sulphate of alumine, which now forms a considerable article of commerce, might be easily increased in a tenfold ratio. The mineral riches of the department, the existence of which was hardly imagined thirty years ago, are found in the chain that separates the Lot from the Aveyron. The mountains containing coal were known only by their spontaneous combustion, the true source of which was not even suspected; the cause of their ignition is probably attributable to the decomposition of sulphuret of iron, although similar fires are often occasioned by accidental causes. A remarkable example of this kind may be seen on the heights of Fontagne, at the distance of four hundred feet above the Aveyron. One may there observe a crevice of an elliptical form, surrounded with plants, of which the pale verdure indicates their languid and unhealthy state. The combustion is not visi-

ble during the day, but favored by the obscurity of the night, flames are seen to rise from the cavity, which resembles a small crater; to the persons who venture to approach, notwithstanding the heat and smoke exhaled from it, it appears filled with a mass of burning coals. The combustion has continued for several centuries, but it is believed that a perceptible diminution has taken place in its intensity. The mountains in the department form the boundaries of six long vallies, watered by the Trueyre, the Lot, the Aveyron, the Viaur, the Tarn and the Sorgues, almost all of which flow in the direction from east to west. The same vallies are filled with fruitful alluvial deposits; the rivers, particularly the Lot and the Tarn, serve to move different works, such as silk, woollen and paper manufactories,^a and facilitate commercial intercourse with the neighbouring departments.

The towns are mostly insignificant, and they may therefore be briefly described. Ville Franche, the chief town in the westernmost district,^b is agreeably situated at the confluence of the Alzon and the Aveyron; it was the birth-place of Marshal Belle-Isle; the neighbouring country abounds in rich pastures.

Rhodesz or Rodez,^c the capital of the department, the smallest and also the ugliest provincial capital^d in France, is built on the declivity of a hill, at the base of which the Aveyron flows with great rapidity. It must not be inferred that the neighbouring country is destitute of beauty; on the contrary, the views from many places are romantic;^e but the dark, dirty, narrow and crooked streets, all built on an inclined plane, are steep and difficult of access. A great many wooden houses, and others of stone, but ill built, project on the streets,^f and the numerous inequalities in the pavement are filled with rough and sharp stones; on the whole, in point of convenience and comfort, it may be said to be several centuries behind the other towns in France. The inhabitants are indebted to the liberality of Francis d'Estaing, one of their bishops, for their cathedral, the only edifice of consequence in Rhodesz. The extent of the nave, the boldness of the vaulted roof, the finely formed windows, the steeple not less than 250 feet in height, and the principal tower terminating in a cupola, and crowned by a colossal statue of the Virgin, render it one of the finest monuments of Gothic architecture in southern France. It has long been considered one of the wonders in the department, and according to a ridiculous Latin inscription on one of the walls, it is said to be equal in height to the pyramids of Egypt. It is affirmed that the Vandals of the revolution would have destroyed the building, had it not been for the address of a single citizen, who preserved it by proposing in an assembly that it should be dedicated to Marat, a motion which was carried by acclamation.^g Rhodesz has given birth to some distinguished men, among others to Hugh Brunet, a troubadour of the twelfth century, and to John de Serres, a protestant theologian. The same town bore before the Roman conquest, the Celtic

name of *Segodunum*, which the Romans changed into *Rutena*,^h because it was the capital of the *Ruteni*. If any opinion may be formed from the resemblance between different words which appear to have passed from the Celtic into the Latin, and other known words of the former language, the people who at a remote period inhabited the province of Rouergue, might with greater accuracy have been called the *Rutheni*, from the Celtic word *Ruth*,ⁱ the same as the German *Roth*, both of which signify *red*; the origin of the name is still indicated by the red colour of the soil and the sandstone near Rhodéz.

St. Afrique, almost encompassed with fine walks, is watered by the Sorgues, which flows in the middle of a valley intersected with orchards, meadows and vineyards. Its crooked streets are lined with Gothic houses; an hospital and the reformed church are the only buildings worthy of notice. The village of Roquefort at two leagues from the town, was famous for its cheese more than eight hundred years ago.

Millhau,^k the Roman *Æmilianum*, is built on the Tarn, in an advantageous situation for trade and manufacturing industry. Severac le Chateau, a town of two thousand inhabitants, rises on a conical hill, commanded by an old Gothic fortress, in which a drawbridge leads to the massive ramparts. St. Geniez d'Olt^l stands on the Lot; *Oltis* was the ancient name of the same river, a name which was probably corrupted into *Olt*.^m It is a neat and small town of 4000 inhabitants, and has given birth to Raynal. Espalion, although not so large, is the capital of a district;ⁿ it is traversed throughout its whole length by a broad and well-built street.

The department which bears the name of the Lot,^o is crossed from east to west by the same river; the Dordogne and the Cere water its northern extremity, and the Sellé, less important than the rest, winds from north-east to south-west, and falls into the Lot. Although the mountains are not lofty, they cover a great extent of surface; different metals are contained in them, and iron is found in sufficient abundance to supply several large founderies.^p The vallies are fruitful in grain, hemp and tobacco; the low hills are covered with vineyards. The excess of the grain harvest above the consumption is considerable; that of the wines amounts to three-fifths.

The inhabitants of Figeac, a town situated on the right bank of the Sellé, are engaged in the manufacture of cotton stuffs, and carry on a great trade in wines and cattle. It owes its origin to a Benedictine abbey founded by Pepin in the year 755. When the abbot made his first entrance into the town, a baron, the lord of Montrun, appeared in the costume of a harlequin, with one leg bare and the other covered with an embroidered stocking; he led a horse from the stable, on which the pious man mounted, and, holding the bridle, conducted him to the church gate, where he waited until the abbot had gone through his devotions, held the stirrup for him on his return, and

led him back to his house. The ceremony was performed for the last time in the year 1766.^a

Cahors was a town before Cæsar invaded Gaul; it was then called *Divona*, and according to tradition it excited the admiration of the Roman general. It is certain that it was embellished by the Romans, who gave it the name of *Cadurci* from the people who inhabited the country. Some vestiges of those ancient times still exist, among others, the remains of a theatre and an aqueduct, and of a monument near the prefect's palace, erected during the reign of Augustus, by the *Cadurci*, to commemorate the courageous resistance which their countrymen made against Cæsar at *Uxellodunum*, the present Capdenac. The cathedral, it has been thought, is partly formed by the remains of an ancient temple, but the portal is of modern construction. The ramparts are used as a public walk; they rise above the Lot, which encompasses nearly the whole town, and the rock on which it stands. The streets are steep and crooked; the royal college, the seminary, the library, the museum of natural history,^c the theatre and the episcopal palace, are nowise remarkable. But the bishopric was one of some importance before the revolution; the prelate, who possessed it, was entitled the count of Cahors, and he had the privilege of having his gloves and sword placed beside the altar whenever he officiated. His installation was accompanied with a ceremony similar in some respects to the one that was performed at Figeac. The viscount of Cessac, the vassal of the bishop, waited for him at the city gate, having his head uncovered, without a mantle, the right leg bare, and a slipper on the right foot. In this dress, he held the bridle of the bishop's mule, and led it to the episcopal palace, where he appeared in the capacity of an attendant, and served his liege lord during dinner. As a recompense for his trouble, he received the mule and the buffct, which had been used at the repast; the value of the latter was fixed at L.130.^d Cahors was the birthplace of pope John XXII, who in the year 1321, founded an university in his native town, of the poet Clement Marot, of La Calprenede the writer of romances, of Joachim Murat, king of Naples, and of general Ramel, who was assassinated at Toulouse in 1815. The manufactures of the town are paper, cloth, and leather.

Gourdon,^e the capital of a subprefecture,^f rises on the small river Bloue; it carries on some trade in sail cloth and woollen stuffs. Souillac is about seven leagues from Gourdon; it contains a royal manufactory of fire arms; it is watered by the Dordogne, over which a fine bridge con-

sisting of seven arches has been erected. Two intermitting fountains, called the *Gourg* and the *Bouley*, are situated in the neighbourhood; the first rises in the valley of Blagour, and the other issues from the heights of Puy Martin. They never flow at the same time; as soon as the one ceases the other begins, and changes in a few minutes the valley which serves as its basin into a sheet of water. The eruption of the Bouley is almost always accompanied with a slight shock and a tremendous noise.

We may pass from the department of the Lot into that of the Dordogne by descending the last river, which traverses it on the south from east to west. It is also watered by the Ille, the Dronne, the Vezere, and by more than fourteen hundred smaller streams. Chains of hills extend through the country in every direction, but with the exception of the two vallies watered by the Ille and the Dordogne, they bound only narrow ravines, almost all of which are desolated by torrents. The soil is by no means productive; the calcareous rocks are in many places bare, and vast districts are covered with heath, broom and chestnut trees; the uniformity thus occasioned is in a few places broken by marshes. Some parts are rich and fruitful, but they are so insignificant in point of extent, that they may be said to form an exception to the general character of the department. The grain harvests are not sufficient for the maintenance of the inhabitants, but the deficiency is supplied by using chestnuts as a substitute. As to the vintage, more than half the wines are either consumed in different parts of France, or they are converted into brandy for exportation.^g Mineral substances abound in the country; the most valuable are coal, manganese and iron. The working of the last metal, and the art of converting it into steel, furnish employment to many of the inhabitants.^h The same country supplies the gourmands in Paris with different delicacies, among which the white wine of Bergerac is not the least important; pork, red partridges, pike, truffles, liqueurs and sweetmeats are also sent to the capital.ⁱ

Sarlat exports a great quantity of paper;^k it is the chief town in a district^l that abounds in iron and copper ore, mill-stones and coal. The people in Belvès^m and Le Bugueⁿ find employment in making walnut oil. The Doux has its source in the same district;^o it rises in a narrow valley, and fills a circular basin, of which the circumference exceeds 176 yards,^o but the depth has not been ascertained. The labyrinths in a cave about three leagues distant from Sarlat, are more than 4200 yards in length; they ex-

ist into the translation, form an amusing illustration of the progress of historical truth.—P.

^a "When the abbot made his first entrance into the town, a baron, the lord of Montbrun, was obliged to receive him in the costume of a harlequin, with one leg bare, to lead to him a horse, on which he mounted, and to hold his bridle to the gate of the church; then to wait for his return, when he held his stirrup, and conducted him to the abbey. The ceremony was performed as late as 1766."—This is apparently taken from the *Encyclopédie Methodique* (Part. Géog. Mod. art. Figeac,) where the same authority is quoted, and almost the same words are employed. The *Encyclopédie* does not say the ceremony was performed in 1766, but quotes the *Journal Encyc.* of that year (March,) and uses the present time in the relation. The latter circumstance might induce one to believe that the ceremony existed at a later period—that part of the *Encyc.* was published in 1782. There is one point in the relation in which the *Encyc.* and the original M. B. differ—the former does not say the baron was obliged to lead him a horse, much less to lead one from the stable, as the translator hath it, but simply that he was obliged to go and receive the abbot, and then lead his horse to the church. It however states in the words of the writer quoted, that the baron, like the viscount of Cessac at Cahors, received the abbot's horse for his pains. The changes the story has undergone in passing from the *Encyclopedia* into the original, and from the orig-

tend between the burgh of Miremont and the village of Privaset.^a The small and neat town of Bergerac rises on the right bank of the Dordogne; its position enables the inhabitants to carry on an advantageous trade with Libourne and Bordeaux. Many persons are employed in the founderies, forges and paper mills in the vicinity. Michel de Montaigne, a village about eight leagues to the west of Bergerac, is situated near the castle which belonged to the celebrated philosopher of that name; the chamber in which most of his essays were composed, may still be seen in one of the turrets.

A road crossing an arid ridge leads to the fruitful valley watered by the Ille, and to Perigueux, the capital of the department, and the seat of a bishopric. It stands on the site of the ancient *Vesunna*.^b The streets are dark, narrow and crooked; the old quarter or the city^c is almost deserted. Were it necessary to indicate its importance in the time of the Romans, it might be sufficient to mention the public baths and aqueducts now in ruins, the remains of the amphitheatre, the tower of *Vesunne*,^d as the inhabitants call it, a circular edifice^e without doors or windows, but communicating with the town by subterranean pas-

^a "At the distance of three leagues from Sarlat, between the small town (*bourg*) of Miremont and the village of Privaset, there is a cavern, the ramifications of which form a total length of more than 2000 toises." The cavern is called the *Cluseau*. (Vosgien.)—P.

sages,^f different inscriptions,^g and many other objects collected in a museum of antiquities. Several monuments of the middle ages, such as the cathedral, and the church of St. Front, in the last of which the Gothic architecture recalls the period of the lower empire, prove how much it has fallen since the time that Pepin defeated the duke of Aquitaine under its walls. The inhabitants of the present day carry on a trade with the capital in turkeys, truffles, pastry, liqueurs and other articles.^h

Brantome, a small town on the left bank of the Dronne, peopled by 2700 inhabitants, was formerly the seat of a Benedictine convent, which might have been long since forgotten, had it not been for Peter de Bourdeilles, better known by the name of Brantome, a writer of some celebrity,ⁱ and although a layman, abbot of the convent. Nontron^k on the right bank of the Bandiat carries on a trade in leather, hardware goods and iron obtained from the mines in the neighbourhood.^l Ribérac, the chief town of a contiguous district,^m rises in a fruitful plain at no great distance from the Dronne, but still nearer an old castle that belonged to the viscounts of Turenne.ⁿ

ⁱ "Author of memoirs of a licentious character."—The memoirs of Brantome were printed in 10 vols. 12mo., and a supplement in five volumes afterwards published. Of the former, four contained accounts of French captains, two of foreign captains, two of gallant women, one of illustrious women, and one of duels. The writings of Brantome are not always perfectly decent, a circumstance attributable to the nature of his undertaking, as historian of a very licentious age. Born 1527; died 1614. Gorton's Biog. Dict.—P.

^k Capital of an arrondissement. M. B. ^l "—manufactures leather, and common knives with boxwood handles, and carries on a trade in the iron furnished by the mines and forges in its neighbourhood."

BOOK CXLIII.

EUROPE.

Europe continued.—France.—Second Section.—Western Region.

WE have had occasion to observe the mild climate, the romantic sites and the remains of Roman power in the twenty-eight departments^a that form the Southern region of France. The inhabitants, it has been seen, are favoured by nature; different productions are admirably adapted for their country, and with the exception of the mountains, the soil is almost everywhere fruitful. But if the population be compared with the surface, it will be found that the result accords ill with the natural advantages of the same vast region, which makes up more than a third part of the kingdom. The extent is equal to 9,000 square leagues, and the population to 8,404,000 individuals; thus the number of inhabitants to every square league does not amount to nine hundred and thirty-four, a result below the mean number in the other divisions of the same country. Such facts are not without their value; if the best and most fruitful part of France is comparatively poor and ill-peopled, it proves how much the munificence of nature may be surpassed by the industry and resources of man. Government too may derive an important lesson from the same fact; it may thus be taught to appreciate the elements of its wealth and power. Thirteen departments make up the Western region; the population relatively to the surface is greater than in the last, for 5,438,000 inhabitants occupy a surface of 4200 square leagues, and consequently the average number to every square league exceeds 1294; still the advantages of education are little known in the Western region; in that point of view it is almost on a level with the preceding. How much then might the population and wealth be increased, if ignorance no longer formed a barrier to the expansion of industry?

Continuing in the direction from south to north, the department of the Charente may be first described. Contiguous, but much inferior in size to the department of the Dordogne, it is intersected on the north by high hills, and on the south by low ridges and heights. Nine rivers, exclusively of the one from which the department takes its name, water it in different directions. The waters of the Tardouere are absorbed by numerous subterranean cavities, and they never reach the Bandiat until they have been swollen by rains. The last river exhibits the same phenomenon;

^a Including Corsica.

^b It is navigable for boats to its source. M. B.

^c "Plateaus"—table-lands.

^d "Barriques."—The *barrique* of Bordeaux is nearly equal to the English wine hogshead, or in the proportion of 12000 to 12034. Encyc. Method.—P.

^e "The iron ore worked in the department, is converted into cast iron in six high furnaces, and into bar iron in fifteen fineries."

the hills which border it are undermined by immense cavities, adorned with the finest stalactites. The Taponnat after a course of some leagues, is lost in similar cavities, and never afterwards appears. The Touvre, almost as large as the Sorgues at Vaucluse, issues from the cavities of a steep rock; although its channel is obstructed by several islands, it might be rendered navigable without much difficulty.^b These rivers, as well as the Peruse, the Ne, the Tude, the Nizonne and the Vienne water vallies abounding in rich pastures. The calcareous ridges^c and sandy plains that cover several districts, account for the aridity of the soil in the greater portion of the department. The arable land is equal to a third part of the whole surface, and the grain harvests are sufficient for the maintenance of the inhabitants; another third is laid out in vineyards, yielding wines of an ordinary quality, but for the most part converted into brandy, of which the quantity exported to other parts of France and to different foreign countries amounts to more than thirty-five thousand barrels.^d The rest of the department is covered with woods of chestnut trees, uncultivated plains, and natural and artificial meadows, the last of which afford pasture to more than thirty thousand oxen, which the inhabitants import every year, and export again after they are fattened. Mines are worked in the department, and iron ore is converted into cast iron and bars.^e

Angouleme rises on a hill, which may be seen from a great distance; the air is pure and salubrious; many of the inhabitants attain to a great age, and the women are distinguished by their beauty. The *Quartier-Neuf*^f is the only part of the town worthy of notice; ill-built houses, and crooked and narrow streets, make up the remainder. The suburb of Ousmeau stands on a declivity above the Charente; the inhabitants have erected several paper mills, distilleries and sugar works; they manufacture woollen stuffs, porcelain and earthen ware.^g It is the capital of the department, and also the seat of a bishopric. It was once fortified, but the ramparts have been changed into public walks, that rise in the form of terraces, and command an extensive horizon bounded by heights; the most remarkable objects in view are the small river of Anguienne, that winds among rich meadows and fruitful hills, the fine bridge over the Charente, and the obelisk raised by government to the present duchess of Angouleme.^h Within the same town are

^f New Quarter.

^g "The suburb of Ousmeau—contains several large paper mills, which with the distilleries, sugar refineries, and manufactories of woollen stuffs and pottery (delft ware,) render the commerce of the town very active."—The trade of the town is chiefly carried on by the Charente.—P.

^h "The obelisk raised, in the middle of the new road (*chemin neuf*), in honour of the duchess of Angouleme."

contained a royal naval school, a college, a library and a museum of natural history; it was the birthplace of Balzac, of Montalembert the engineer, and of the assassin of Henry the Fourth.^a It is a place of great antiquity; the Romans called it *Iculisma*;^b it is more than once mentioned by Ausonius, but it did not rise into importance before the period of the middle ages. La Rochefoucault, a small town on the Tardouere, consists of a single street; it contains 3000 inhabitants. The old Gothic castle which commands it, was the birthplace of the duke, whose fame has been perpetuated by his book of maxims.

Confolans,^c surrounded by a comparatively sterile country, and the capital of a subprefecture, derives its name from the confluence of the Goire and the Vienne; it is not, however, unpleasantly situated, and the banks of both the rivers are fruitful in pastures. A single square tower is all that remains of its ancient strong castle. It is necessary to cross the Charente at two places on the road that leads from Confolans to the small and neat town of Ruffec, that rises on the right bank of the same river. Beyond a small chain of hills, terminating on the south in the neighbourhood of the Charente, which describes many windings through large meadows, the town of Jarnac rises on both banks of the same river, on which it possesses a port of some importance. A modern monument erected in the neighbouring plain, serves to mark the field of battle, where the duke of Anjou defeated the prince of Condé in the year 1569. As it has been thought consistent with good taste to commemorate the fatal engagement in which Frenchmen fought against each other, the place near the walls of the town, where the unfortunate prince was assassinated by the marquis of Montesquiou^d after the victory, ought also to have been indicated. Cognac, the capital of the same district,^e rises on an eminence, of which the base is watered by the Charente. Francis the First was born in the old castle that defended formerly this small commercial city, the mart of the excellent brandy and liqueurs that are distilled in the adjoining districts.^f

Barbezieux in the midst of the fruitful country through which the Ne flows, is neither so populous nor so well built as Cognac;^g it rises on the declivity of a hill, on the high road from Paris to Bordeaux; the ancient fortress has been changed into a prison. The trade it carries on with the metropolis, consists chiefly in capons and truffles.^h Aubeterre on the Dronne, at the southern extremity of the department, is finely situated at the base of a hill, commanded by an ancient castle. The church is cut in the rock which supports part of the town.

The lower part of the Charente waters a countryⁱ fruitful in corn and pasturage, and abounding in vineyards of which the produce is converted into brandy. The great extent of coast washed by the mouth of the Gironde and the ocean tends to enrich a laborious population. There are not many inequalities in the department; the surface is

chiefly occupied by low hills and extensive plains, and the climate is generally salubrious. But the salt marshes near the sea, which furnish the salt known in England by the name of Rochelle salt,^k diffuse pestilential exhalations, and occasion different diseases in their neighbourhood. Many anchorages and ports facilitate navigation, promote the coasting trade, and induce companies or individuals to equip vessels for the cod fisheries and the French colonies. Lastly, the islands of Re, Olcron and Aix add to the maritime importance of the department.

Jonzac^l is situated in a part of the country contiguous to the last department; it is the chief town in an ill-peopled district,^m but is inferior in population to the burgh of Mirambeau, which contains 3200 inhabitants. Saintesⁿ the capital of Saintonge, is an old and probably on that account, a dirty town. Ammianus Marcellinus considered it one of the most flourishing cities in Aquitaine. It was originally called *Mediolanum*, which the Romans changed afterwards into *Santonnes*, after the name of the people in that part of Gaul. It possesses still the remains of a triumphal arch, and the ruins of an amphitheatre. It was the seat of a bishopric, and several councils have been held in the town. The last met in the year 1096, and enjoined the faithful to fast during the vigils of the apostles. The residence of the subprefect, the theatre, the college and the ancient cathedral cannot be commended on account of their architecture; the public library contains 24,000 volumes. Bernard de Palissy was born at Saintes,^o a man of genius, who from the condition of a potter became one of the most eminent natural philosophers of the sixteenth century. The Boutonne, a small river, begins to be navigable at St. Jean d'Angely,^p and enables the industrious inhabitants to carry on a trade in brandy and timber. Religious wars were long fatal to the town; indeed they may be said to have been so from the period of the memorable siege by which it fell into the hands of Henry the Third, to the time it supported another siege against Louis the Thirteenth, who razed the fortifications. Henry the Second of Bourbon Condé, and Regnaud,^q a statesman under the imperial government, were born in St. Jean d'Angely. It possesses a royal powder manufactory. The horses in the neighbourhood are much valued in different parts of France.^r Marennes, about half a league distant from the sea, is exposed to the pernicious exhalations from the salt marshes. Although a well built and a commercial town, it might have been much more flourishing than at present, had it not been for its unhealthy situation. Tonny-Charente^s possesses a safe and commodious harbour for vessels of a hundred tons.

Rochefort rises on the Charente, about a league's distance from the last place; the harbour, one of the three largest in France, is about 2500 yards in length;^t it has a sufficient depth of water to float ships of the line^u at low tide.^x Ships of 600 tons with their cargoes, enter a smaller harbour

adapted for merchant vessels. Rochefort is about four leagues distant from the ocean, but the advantages of an admirable position are increased by large dockyards, careening wharfs, naval storehouses, cordage and sail manufactories.^a The town is regularly built, the streets are straight, many of them terminate in a large piece of ground planted with trees.^b The hospital, the prison^c in which 2400 galley-slaves may be confined, the cannon foundery and the arsenal are the finest buildings. A reservoir enables the inhabitants to water the streets daily, a precaution by so much the more necessary as from the month of August to that of October, the air of Rochefort is any thing but salubrious. The works that defend it are the ramparts by which it is surrounded, and the forts constructed at the mouth of the Charente. An excellent road leads to Rochelle,^d the capital of the department.

The latter town was founded in the tenth century. Philip Augustus conferred several privileges on the inhabitants; it was ceded to the English by the treaty of Bretigny. Charles the Fifth contrived to add it to his dominions; the political divisions to which the reformation gave so much importance, rendered it the centre of protestant opposition; it was finally besieged by Louis the Thirteenth, and taken after a resistance of thirteen months, a resistance which cost the king more than L.2,000,000.^e Situated at the bottom of a small gulf, the harbour is safe and commodious; whatever be the height of the waters in the ocean, vessels may be careened in the basin, in which they receive their cargoes. The fortifications were constructed by Vauban. Straight streets, many houses adorned with porticos that form arcades, the elegant court of the castle,^f the exchange and the townhouse give the place an imposing aspect. It was the native town of Reaumur, of Seignette the druggist, who discovered the purgative salt that bears his name, and of several other distinguished men. It is not remarkable, therefore, to find it the seat of learned and scientific societies; it also possesses a valuable library, a museum of natural history, a botanical garden, a college, and a school of navigation. The *Mall*,^g a public walk, commands a view of the ocean; from it may be seen the isle of Re,^h on the right, peopled by fishermen, and encompassed with breakers, the isle of Aix in front, where vessels wait for favourable winds, and the important Oleron on the left, an island abounding in wine and salt. Marans, a small but neat town at the northern extremity of the department, carries on a trade in salt, and contains four thousand inhabitants; it has a safe harbour on the Sevre Niortaise at the distance of four milesⁱ from the sea, to which vessels of a hundred tons are borne by the tides.

The Vendée, the largest feeder of the Sevre Niortaise, is only navigable in a small part of its course, not more than six leagues in length. At the time France was divided according to the new divisions, the same river was chosen rather than the Lay, although the last is somewhat larger, and the name of La Vendée was given to one of the most fruitful maritime departments^k—a department which by its

devotedness to the royal cause, became at the commencement of the revolution, the focus of a civil war, that lasted not less than seven years, and desolated almost all the western part of France. Its surface may be divided into three parts. The *Marais*^l comprehends all the country on the coast; it is covered with sands which have been rendered productive by canals and the labour of man, and it abounds also in marshes, which from their extent and the quantity of salt collected from them, seem to indicate that the ocean covered these coasts at a comparatively recent period. The *Bocage*,^m consisting in some places of sterile heaths, and in others of woods, is intersected by numerous streams that serve to water and fructify it. The Plain formed by all the country between the Bocage and the southern limit of the department, may be considered the most fertile division, and the best adapted for every sort of cultivation. The mephitic vapours that rise from the Marais, are fatal to the health of the inhabitants; drained by many canals, which intersect it in different directions, destitute of springs, and only affording water more or less brackish to quench the thirst, it is with all these disadvantages one of the best cultivated countries in France. It produces excellent hemp, abundant grain harvests, leguminous plantsⁿ remarkable for their size, and pastures in which large breeds of horses, oxen and sheep are reared. The Bocage yields good wine, and the fields are intersected by hedges and orchards. The Plain is fruitful in every sort of grain, but white wines of an ordinary quality are only produced in the vineyards. The manufacture of earthen-ware, cordage, linens and coarse woollens, the extracting of soda from sea-weed, the fisheries, and the preparation of salt in the marshes on the coast, form the principal branches of industry.

The name of Fontenay le Comte excited the indignation of the republican government; ridiculously jealous of whatever might be associated with the ancient system, it did not suffer the town to be called by its usual name, but changed it by a decree into that of Fontenay le Peuple. It stands in a fruitful valley on the left bank of the Vendée. The sombre remains of a strong castle, a church of which the steeple is about 300 feet in height, and suburbs larger than the town itself, give it the appearance of an important city; it is the capital of a district.^o Luçon, the second town in the same district,^p has been made the seat of a bishopric;^q it contains about 3600 inhabitants. The houses are well built, but the streets are ill paved; it is situated at the extremity of a canal, which throws itself into the sea at the Anse d'Aiguillon.^r A road through a dull and monotonous country leads to Sables d'Olonne,^s a town consisting of four long straight and parallel streets, built on a narrow stripe of sandy land that protrudes into the sea, and defended by several batteries. The harbour which can only receive vessels of a hundred and fifty tons, separates the town from the suburb of Chaume,^t which rises on a rock. St. Gilles, another seaport on the same coast, lies opposite the isle of Yeu,^u which is only inhabited by fishermen; but Noirmoutier, a

larger island at some distance from it to the north, contains two villages and a town of the same name, and is peopled by 7500 individuals. Both these islands form part of the district^a of Sables d'Olonne, which extends on the north to the isle of Bouin, formerly a calcareous rock, but at present more than seven leagues in circumference, and united to the continent by a causeway thrown across the canal, by which it was formerly separated from the main land.^b The island gives its name to a village of 2500 inhabitants.

Bourbon Vendée, a thinly peopled town,^c but the only one of any consequence that has not been mentioned, was formerly the burgh of La Roche sur Yon in the principality that belonged to the house of Bourbon-Conti. It contained hardly 800 inhabitants in 1807, when its name was changed into that of the emperor,^d who laid out L.126,000^e in erecting the necessary buildings for the chief town of a prefecture;^f in 1814, its name was again changed into that of Bourbon Vendée. It is built after the plan of a large city, but most of the edifices remain unfinished, owing to the want of funds; the streets are broad and straight, but deserted. From its position on the small river Yon, at a distance from all navigable rivers, and from any populous town, it can never become a place of commerce or industry until the projected canal of Bret has been completed.

The department of the Two Sevres^g is bounded on the west by that of La Vendée, and is crossed in a diagonal direction by the heights of Gatine, a chain of lofty hills shaded by forests, from which the inhabitants export different sorts of timber. Intersected by many small streams, it takes its name from the two Sevres, the one flowing from south to north, and the other from east to west; the former is called the Sevre Nantaise, because it enters the Loire opposite Nantes, and the latter the Sevre Niortaise, because it passes by Niort. Many fine vallies and plains, fruitful in vineyards and pastures, extend in different directions, but it contains also much uncultivated land, and numerous ponds and marshes. The produce in grain and wine exceeds the consumption; herds and flocks are reared in the meadows. It furnishes the mules that are so much prized by the wealthy Spaniards,^h others that travel with heavy burdens across the steep Alps and Pyrenees, and others too, that drag the enormous waggons, which are seen on all the roads in the south of France. The sale of these animals in foreign countries and in other parts of France, yields several millions of francs to the department. The oxen form also a lucrative branch of commerce; the fattest are sent to Paris, but the greater number are sold and fattened in Normandy. The people work iron,ⁱ and manufacture cotton and coarse woollen stuffs.

Niort, the capital of the department, and a place of some antiquity, has been much improved; modern buildings now occupy the site of the rubbish and old houses, that rendered it formerly one of the dirtiest towns in Poitou. The most remarkable edifices are an old Gothic church built by the English, the townhouse, the ancient palace that belonged to

Eleanor of Aquitaine, and the fine fountain of Vivier.^k Madame de Maintenon was born in one of the prisons in the same town; among the celebrated men that it has produced, Isaac de Beausobre and Louis de Fontanes may be mentioned. The picturesque banks of the Sevre in the neighbourhood add to the beauty of the public walks and gardens. The small town of Mauzé is the capital of a district^l from which fifteen or twenty thousand asses are annually exported. St. Maixent, a town of five thousand souls, may be mentioned on account of the fruitful country in the neighbourhood. The finest mules in Europe are reared in the district,^m of which Melle is the chief town.

After having crossed the heights of Gatine, the traveller enters a plain watered by the Thouet. Parthenayⁿ rises near its banks, on a hill formerly commanded by an ancient castle now in ruins. The village of La Foret, at no great distance from the sources of the Sevre Nantaise, contains the tomb of the celebrated Duplessis Mornay, whom the catholics called the pope of the Huguenots; the river flows in the neighbourhood, and serves to move different mills.^o Bressuire is situated on a hill, which borders the course of the Argenton; it was so much injured during the wars of La Vendée, that at one time the only buildings left entire were a solitary house and the granite church. It has since become the capital of a subprefecture, and the inhabitants manufacture linen and woollen stuffs. In a north-east direction, and about five leagues distant from the last place, the Thouet flows round the base of a hill, on the summit of which rises the town of Thouars. It was probably founded before the sixth century; its name signifies the citadel of the Thouet.^p Pepin took it in the year 758, and the English rendered it in the middle ages one of the strongest places in Poitou. As the town was more than once desolated during the late civil wars,^q it may excite surprise that the magnificent castle built in the time of Louis the Thirteenth by the duchess of La Tremouille,^r remains entire.

The Vienne gives its name to a department^s through which it passes from south to north. Some of the hills on the south are lofty, but those on the north are insignificant; the centre of the department is occupied by an extensive table-land, partly encompassed by the Vienne, and partly by the Clain, one of its feeders; the eastern districts consist of low plains and vallies. The soil cannot be said to be fruitful; the surface is covered in many places with landes and heaths; still as much grain is produced as the inhabitants consume, and a surplus quantity of wine, by no means inconsiderable, is either exported or converted into brandy.^t Different mineral springs and iron mines are situated in the department; it is unnecessary to mention the hardware goods, the cutlery, the coarse woollen stuffs and the ordinary lace that the inhabitants manufacture;^u it may be sufficient to remark that the greatest hindrance to their commerce is the want of roads and other outlets.

Civray, a small town and the capital of the most southern district,^x possesses a church, which was probably built before

^a "Arrondissement."

^b It was a few years since separated from the main, by a channel practicable by vessels of 200 to 300 tons, but which by the accumulation of sand is now reduced to a boat passage. The island has three leagues of surface almost entirely consisting of salt marshes. Tuckey, vol. II. p. 28.—P.

the establishment of Christianity in Gaul. Montmorillon, situated on the Gartempe, is the capital of another district;^a it is noted for its biscuits and macaroons, which are exported to different parts of France. An ancient and very curious monument, supposed by many to be of Druidical origin, stands in the court of the old convent that belonged to the Augustines.

Poitiers,^b the former capital of Poitou, rises on a hill at the confluence of the Boivre and the Clain. It was the *Limonum* of the *Pictavi*, an important place in the time of Ptolemy; it is now the capital of the department, and it still retains its old walls flanked with towers, the venerable witnesses of the invasion of the country by the Visigoths, and of their defeat by Clovis. King John of France, after having refused the advantageous terms offered by prince Edward,^c lost the memorable battle of Poitiers, in which a French army of eighty thousand men was defeated by eight thousand English; the king was taken prisoner and conveyed to England. Charles the Seventh removed the parliament of Paris to Poitiers during the wars he maintained against the English. The streets are narrow and crooked, but some traces of ancient splendour may be discovered in the remains of the palace erected by the emperor Gallienus, in the ruins of an amphitheatre, and in the name of the street that is still called the *Arena*.^d The Guillon,^e a picturesque walk in the neighbourhood, terminates near the imposing ruins of a Gothic castle. The cathedral, which in point of size is equal to any other in France, was built in the eleventh century, but the bishopric of Poitiers dates from a much earlier epoch; not less than twenty-three councils were held in the town during the period from the middle of the fourth to the beginning of the fifteenth century.^f The ashes of Madame de Montespan rest in the Grey Friars' church;^g St. Hilary and St. Maximin, two bishops of the fourth century, were born in Poitiers; it contains a curious collection of antiquities,^h and a library of 22,000 volumes.

The Vienne begins to be navigable at seven leagues to the north-east of Poitiers. Chatellerautⁱ rises on the right bank of the river, over which a modern bridge has been erected, that leads to an old castle flanked with four large towers; it may be doubted that the building adds much to the strength of the place, but it serves at least as a gate to the town.^k Loudun is about nine leagues distant in a north-west direction from Chatelleraut; it is situated on a hill, and surrounded by vineyards that yield good wine. Although an

insignificant town, it has given birth to several distinguished men; among others, to John Maigret,^l better known by the name of Maecin, from the assumed Latin one of Macrinus, and to Renaudot the physician, who published the first French newspaper^m in the year 1631. Urban Grandier, a curate,ⁿ was accused and condemned in the same town during the reign of Louis the Thirteenth. A song that he had written against Cardinal Richelieu was the cause of his death; a pretext, however, was necessary, and it was alleged that he had bewitched a convent of Ursuline nuns.^o Ignorant and superstitious women may be excited or bribed to swear on the altar that they are possessed by demons; if the experiment were renewed at present, it might be followed with the same success; it is much more wonderful that they were believed at so recent a period, at a time when many great and good men were living in France. Although a matter of deep regret, it ought not to be concealed that clergymen perhaps suborned, certainly encouraged and confirmed such witnesses in their delusion; the same men put an innocent brother to the torture, and afterwards burnt him alive to gratify the vengeance of a minister, whose great actions were sullied by greater crimes.^p

The department of the Maine and Loire derives its name from its two principal rivers, the Loire and the Maine. The former flows through it from east to west, and receives the latter, which is formed by the union of the Mayenne and the Sarthe. Manufacturing industry, the culture of corn and the vine, and the working of mines, and of granite, marble and slate quarries, are the principal sources of its wealth. The coal pits in the same department yield every year more than 10,000 chaldrons.^q

Saumur is situated on the left bank of the Loire; a suburb rises on the opposite bank of the river, which is crossed by a well built bridge of twelve arches. The quay is the most frequented walk, and the principal buildings in that part of the town are a royal riding school, spacious barracks^r and a theatre. A broad street leads to the declivity of a steep hill on which part of the town has been built.^s A strong castle rises on the summit of the same height, and it serves at present as a depot for arms and ammunition. The portal of St. Peter's church is modern, but the rest of the building is very ancient. The town-house is a Gothic edifice. The quay, which extends beyond the public walk, terminates at a fine hospital^t built near the chalky height that commands the town; the neighbouring excavations in the same hill

ⁿ Curate (*curé*) of St. Peter's at Loudun.—P.

^o The convent of Ursulines at Loudun.—P.

^p "The town was rendered famous during the reign of Louis XIII. by the trial of the curate Urban Grandier, who for having ventured to write a song against Cardinal Richelieu, was accused of bewitching the nuns in the Ursuline convent. It is difficult to conceive how at a period so recent and when France could boast of many individuals of great intelligence, any nuns could be found so fanatical as to declare

at the altar that they were possessed with demons, or any priests so weak and cruel as to pretend to be convinced of the guilt of Grandier, and even to put him to the torture before condemning him to the flames. These shameful intrigues were only meant to satisfy the resentment of a minister whose great talents were sullied with great crimes." It is said that the persecution of Grandier arose from the hostility of the monks of Loudun, and that in order to gratify their hatred, they persuaded Cardinal Richelieu that Grandier was the author of "*La Cordonnère de Loudun*," a severe satire on his person and family, and by this means succeeded in effecting their malevolent purpose Moreri. have been converted into a lunatic asylum.^a Saumur is watered on the west by the Thoue, a small river over which the inhabitants erected of late years a bridge, where general Berton halted very unexpectedly at a time when he might have easily taken the town. Three druidical monuments are situated in the neighbourhood: one of them is a natural obelisk that rises vertically to a considerable height;^b the two others, which consist of several stones laid flat upon other stones,^c are two *cromlechs*^d in a good state of preservation; the smallest stands on a sloping hill; the other, remarkable for its great size, rises in the middle of a plain. Saumur is a place of considerable trade; it employs 600 individuals of both sexes and different ages in a particular department of industry; they manufacture beads and enamels, of which the quantity exported may amount in value to L.20,000.^{e f} Doué, about four leagues distant from Saumur, is peopled by two thousand inhabitants. It contains the ruins of a Roman amphitheatre formed by excavations in a calcareous rock, the remains of an old palace, which is said to have belonged to king Dagobert, and one of the finest fountains in France. Extensive grottos are situated in the neighbourhood.

The road from Saumur to Baugé is nowise remarkable, and the latter town, although the capital of a subprefecture,^g might be passed over in silence, if it were not for the fine bridge that has been lately erected over the Couesnon.^h An English army was defeated at no great distance from Baugé in the year 1421.ⁱ The same district^k carries on a great trade in paper; thus although Durtal^l is a small town of 3000 inhabitants, it possesses several paper mills, and the inhabitants also manufacture linen, tiles and earthen ware. Durtal has been admired for its situation on the banks of the Loir, and at the base of a hill commanded by two colossal towers, the only remains of an old castle, that was founded in the eleventh century. The Oudon waters Segré, which although the chief town in a subprefecture,^g is inferior in population and industry to the burgh of Chateau-Neuf on the Sarthe, and to Pouancé, which is enriched by iron works, to Lion d'Angers, worthy of notice for its picturesque situation, and to other burghs and towns in the same district.^k

Angers rises on the declivity of a hill at no great distance below the confluence of the Mayenne and the Sarthe.^m The ramparts,ⁿ the public walks, particularly the Turcie and the Champ de Mars, the cathedral with its two steeples rising into the air, and a Gothic castle, the ancient residence of the dukes of Anjou, in which eighteen large towers form an imposing mass, give the town an appearance of splendour that it does not possess. The streets are narrow; some of the houses are built of wood, while others are constructed

with blocks of the slate, with which the roofs are generally covered.^o It must be confessed, however, that the modern additions made to the town, the quarter near the ramparts, and others are regularly and well built.^p Angers possesses a library consisting of 26,000 volumes, a valuable collection of French paintings, a museum of natural history, a botanical garden, and two theatres. It was a place of some importance before the Roman conquest; it was then called *Juliomagus*; the Romans changed its name afterwards into *Andecavum*.^q It has given birth to Bernier, the celebrated traveller, and to Menage, a poet and a man of letters, whom Moliere has represented in the character of Vadius.^r In the neighbourhood are situated extensive slate quarries, which afford employment to about three thousand workmen, and from which nearly eighty millions of slates are obtained every year.

Pont de Ce^s on the banks of the Loire, about a league distant from Angers, contains only 3000 inhabitants; it may be remarked however for its series of bridges and embankments, forming a line more than 3000 yards in length, and extending across the different islands and branches of the river. The remains of a Roman camp, occupying a great space, are situated near the confluence of the Mayenne. Ingrande near the road to Nantes possesses glass works in which five hundred workmen are employed. Chalonne a town of 5000 inhabitants, in a district famous for its vineyards, is built near the confluence of the Layon and the Loire; it fronts the Lombardiere islands, whose verdant groves and delightful scenery form one of the finest landscapes on the banks of the Loire. Coal and other mineral substances are worked in the neighbourhood.^t

Beaupreau between the same river and the southern limits of the department, is the chief town in a fruitful and industrious district.^u The inhabitants manufacture linen and woollen stuffs, and many of them are employed in dying cloth; they carry on besides a considerable trade in leather.^v The village of Mont-Jean is almost surrounded by coal mines; the prosperity of Tessouale, another village, depends on its bleach-fields.^w Chemillé, a small place of 4000 inhabitants, has been enriched by the same manufactures which have rendered Cholet^x a flourishing town. The latter was adorned with a fine castle, which was destroyed in common with almost all the other buildings during the wars of La Vendée; but it has risen from its ruins and increased in industry, and its population has been doubled; it contains in present more than 7000 inhabitants. The improvements introduced into the manufactories, and the greater demand for their products, are the cause of so much prosperity.^{aa}

The romantic sites and varied landscapes watered by the

^x "It possesses several manufactories of linen and woollen stuffs, and also dye-houses and tanneries."

^y "Near the village of Mont-Jean, are extensive coal mines, and at that of Tessouale, a fine bleach-field." ^z Chollet.

^{aa} "The improvements it has introduced into its manufactures of linens, cotton handkerchiefs, coarse cottons and flannels, have given them no small degree of reputation."

Loire, have given the river a celebrity which it might not have otherwise possessed. And certainly the lower part of its course serves to confirm the general opinion, and accounts for the songs that have been made in its praise.^a Neat villages, picturesque vallies, hills covered with vineyards, and rich meadows, may be seen on that part of the road to Nantes, extending from Montrelais, a village enriched by its coals and excellent wines, to the burgh of Oudon, where two chains of hills line the opposite banks of the Loire. The appearance of the country changes beyond the last place; the fields are no longer covered with luxuriant harvests, and the traveller might suppose himself in Brittany from the ferns, buckwheat and heath. Lastly, the cathedral of Nantes is seen, as the traveller reaches a well-cultivated plain, about two leagues in length.

Many rivers water the department of the Lower Loire; it is also bathed by the Ocean, the coasts of which are nearly twenty-five leagues long and are continually enlarged by alluvial deposits. It may be remarked too that the salt marshes on the same coasts are very valuable. Different districts in the department are covered with rich pastures and thick forests; it is fruitful in grain, and still more so in wine; it abounds in coal and iron; the inhabitants smelt the ore, and convert the metal into different articles which are sold in many parts of France.^b The other products of industry in the same department are porcelain, china and different manufactures;^c it carries on a trade with the principal European states,^d and it equips vessels for the herring, sardel and cod fisheries. The capital, not unworthy of the country, may be ranked among the largest towns in France.

Nantes, after Bordeaux, the most commercial town which communicates with the ocean, rises on the right bank of the Loire, at the place where the Erdre and the Sevre fall into the river.^e It occupies the site of *Condivicnum*, the principal city inhabited by the *Namnetes*; the ancient Celtic name indicates its position, for it signifies a town at the confluence of several streams. It may be admired for the regularity of the streets, the elegance of the public buildings, and the magnificence of the quays. Some parts of the town, such as the quarter of Graslin, the isle of Feydeau and the suburb of La Fosse, may bear a comparison with the finest quarters in Paris. The verdant banks of the river, the islands in different directions, and the natural amphitheatre that rises beyond them, render Nantes in point of situation, at least equal if not superior to any other town. The port of La Fosse is shaded with lofty trees, and lined with large buildings that extend to the distance of half a league. The same port is about twelve leagues from the ocean, and although one of the most frequented in France, it has the disadvantage of being inaccessible to vessels above three hundred tons,^f because the tide does not rise higher

^a "The Loire, in the lower part of its course, does not belie the reputation it has acquired from the beautiful scenery on its banks."

^b "The produce of its iron mines supplies four high furnaces and twelve fineries."

^c "It possesses manufactories of delft ware, porcelain and different stuffs."

^d "It carries on an important commerce with different parts of the globe."

ⁱ "At the extremity of St. Peter's Course (*Cours de St. Pierre.*) an agreeable and spacious promenade, the old castle of the dukes of Brittany rises on the banks of the Loire."

than six feet.^g The exchange, which appears like a monument erected to the commerce and shipping of France, exhibits a fine front adorned with an Ionic peristyle, and a portico on the opposite side, crowned with the statues of Duguay-Trouin, Duquesne, John Bart and Cassart. The residence of the prefect was the ancient court of exchequer;^h the front of the theatre presents a range of eight large Corinthian columns. St. Peter's course, a spacious and pleasant walk on the banks of the Loire, leads to the old castle that belonged to the dukes of Brittany;ⁱ it was built by one of them in the year 930, and has acquired celebrity from the edict issued by Henry the Fourth, the revocation of which by his grandson was the cause of innumerable calamities to France. Among the useful institutions, it may be worth while to mention a fine collection of paintings, a valuable public library, a museum of natural history, better than any other in any provincial town, a large botanical garden, a royal college, and lastly schools of medicine and hydrography. The charitable institutions are creditable to the benevolence of the inhabitants; the manner in which they are managed, is not less creditable to the civic rulers.^k Nantes is the seat of a bishopric which was erected in the third century.^l It was fortified in the time of Cæsar; it maintained a terrible siege against the Huns in the year 445; the Normans ravaged it in 843, and put all the inhabitants to the sword. The English besieged it in vain in 1343. A Vendean army consisting of 80,000 men attempted to take it by assault in 1793, but they were defeated and repulsed by the citizens. It became at a later period the theatre of the horrible executions which were sanctioned by Carrier. Nantes has given birth to the learned Mathurin Veyssiere,^m to René Le Pays, a poet of the seventeenth century, to Boffrand the architect, to Cassart the navigator,ⁿ to Cacault the diplomatist, to Bouguer the mathematician, and to Fouché, duke of Otranto, and minister of police. It possesses a cannon foundry, and dockyards in which merchant vessels and sloops of war are built; it also supplies part of the navy with cordage, sail-cloth and iron cables; there are besides several sugar works, cotton and cloth manufactories, tan-pits and different works of less consequence.^o

From the extremity of the department to Nantes, the Sevre waters a country not less romantic than Switzerland, and more interesting from the associations connected with it. The village of Palet was the birthplace of Abeilard;^p in the woods and rocks in the neighbourhood, Heloise and her lover bewailed their misfortunes after the base Fulbert had satisfied his monkish vengeance. The small town of Clisson contains only 1200 inhabitants, but it recalls the title of a family that rendered itself illustrious in the annals of France; their castle, formerly remarkable for its architect-

^k "The town house, in which there is a fine collection of paintings, the public library, the museum of natural history, next in importance to that of Paris, the botanical garden, remarkable for its situation and extent, the royal college, the schools of medicine and hydrography, and several establishments for the support and education of poor children, are creditable to the municipal authorities."

^o "It possesses sugar refineries, cotton mills (*filatures*), cloth manufactories, tanneries, and other manufacturing establishments of less importance."

^p The name is written variously in different authors: Abailard, Abailard, Abaelard and Abelard. The last is generally used in English authors. The name of the village is generally written Palais.—P.

ure, now majestic in its ruins, stands on a height near the town. Painbœuf,^a on the left bank of the Loire, about ten leagues below Nantes, was a hundred years ago a mere hamlet peopled by a few fishermen; but commerce has since changed it into a flourishing and well built city, at present the capital of a district.^b

The most remarkable places on the south of the Loire have now been mentioned; towards the north and on the right bank of the river is situated Ancenis, a pleasant town, commanded by the old castle which was long inhabited by the dukes of Bethune. Chateaubriant, on the other side of the small river Don, is well known for its preserves.^c Savenay on the south-west of the last place, is the chief town in a district^d that carries on a considerable trade in cattle and salt. Guerande, a more industrious and more populous town, and Pouliguen possessing a convenient harbour,^e are situated in the midst of salt marshes which yield every year nearly eighteen thousand tons^f of grey and white salt.

The word Morbihan, it has been said, signifies a small sea in Low Breton or perhaps in some Celtic dialect. The gulf of the same name is larger than any other on the coasts of the department, which the lower course of the Vilaine^g separates from the one that has been last examined.^h The same gulf encloses a great many small islands, the two largest of which, or the Isle aux Moines and that of Arz, are well peopled and cultivated.ⁱ Vannes is about a league from the most northern bay in the same gulf; two small rivers water and surround it; they add to the convenience of its harbour, and the advantages of its position. According to ancient authors, the walls of the town must have been bathed by the sea at the time when it was not only the principal city of the *Veneti*, but the most powerful, wealthy and populous of any in Armorica.^k An old wall flanked with towers separates the town from a suburb which exceeds it in size. The heavy and massive cathedral rises in the midst of dismal houses and dark streets. The freestone quays along the narrow harbour may be admired for their solidity, but the finest buildings are erected on the mole which extends near a small salt marsh. Three public walks are frequented in the vicinity, and within the walls are situated a college, an hospital and a theatre;^l the industry of the inhabitants is confined to sardel fisheries and to the manufacture of coarse cloth. Such is the capital of a department which, although poor in vineyards, is fruitful in corn, pastures, timber, flax and hemp. The marshes and landes are without doubt extensive; still the inhabitants rear many

^k Cæsar. de Bello Gallico, Lib. III.

horses, oxen and sheep.^m Iron mines are wrought in different parts of the country; the inhabitants export the leather, linen and woollen stuffs manufactured in the department.ⁿ

Sarzeau, on the peninsula of Rhuys, is a small town peopled by 6000 inhabitants, who are mostly fishermen. The castle of Suscinion was erected on the coast by Anne, duchess of Brittany, and the monastery of St. Gildas^o may still be seen on another part of the coast of the same peninsula; according to tradition, the monks possess the chair of Abeilard; it is certain that he was the abbot of the convent.^p

The islands which Pliny calls *Insulæ Veneticæ*, rise opposite the coast between Vannes and Lorient;^q all of them belong to the department. The inhabitants of Belle-Isle en Mer, the largest as well as the richest of these islands, rear cattle, and export every year nearly eight hundred draught horses of the best kind in France. It contains 8000 souls, three small harbours and the burgh of St. Palais^r defended by a castle. A small fortress guards Hoedic, of which the inhabitants, like those of Houat, earn their livelihood by fishing. Groix or Groaix, the most northern of these islands, is peopled by 2000 individuals scattered in different villages; they are at once husbandmen and fishers. Quiberon, or as old writers call it,^s Keberoen, a peninsula about two leagues in length, and a quarter of a league in breadth, is changed into an island during the full tide. It is celebrated for the descent made in 1795 by 10,000 emigrants under the protection of the English fleet; abandoned by allies who might have saved them, they were completely defeated by general Hoche. A monument perpetuates the memory of the event.

The burgh of Carnac, situated on a height near the coast, at some distance to the north of Quiberon, has been often mentioned by antiquaries on account of a druidical monument; the size and the arrangement of the parts have been much admired, but its true purpose has never been explained. It is formed by more than five thousand granite stones, rudely cut and arranged in eleven straight and parallel rows.^t As it has been proved that they were not erected by the Romans to commemorate the victory gained by Cæsar over the Veneti,^u it may with probability be inferred that they were raised for the same superstitious purposes as other Celtic relics of a like kind. The port of Lorient, the chief town in a district^x of the same name, was built in 1719 by the India company^y at the mouth of the Scorff, and on the bay of Port Louis. The town is large and well built, but it is no longer enriched by the commerce, which excited

^y "Compagnie des Indes"—formed in 1719 by the union of several companies, the most important of which were the East India and the West India companies. Savary, Diet. Comm.—P.

the jealousy of the English, who attempted to destroy it in 1746, when a nobleman of Brittany,^a having arrived with some assistance, displayed so much energy that the besiegers fled and left several cannon behind them, which the king presented to the town. If the harbour now appears more deserted than it really is, it should be recollected that its extent was made to correspond with the importance of its commercial transactions, at the time when the affairs of the India company in France were in a flourishing condition. Port Louis, about a league's distance to the south of Lorient, rises at the mouth of the Blavet in a situation well adapted for trade. The harbour is convenient,^b and the citadel which guards the entrance into the bay, was built by Louis the Thirteenth. The population does not exceed 3000 inhabitants. The old castle of Trafaven stands on the right bank of the Scorff, a castle which the imagination of the peasantry has peopled with sprites and fairies.

Ploërmel is situated near the confluence of the Oust and the Malestroit, beyond a chain of high hills, which crosses the department from north-west to south-east. It was an important town about the tenth century, but the old edifices were mostly destroyed when it was besieged by Henry the Fourth; there may still be seen, however, a Gothic church, adorned with painted windows and with the tombs of two dukes of Brittany, John the Second and John the Third. The waters which flow from a lake nearly three leagues in circumference, at a short distance from the town, form a fine cascade. The Blavet waters the western declivities of the same heights; it is navigable to Pontivy, a town situated on the left bank of the river, in a fruitful country. Now the capital of a district,^c it bore under the imperial government the name of Napoleonville. It owes its origin to the monastery in which St. Josse, the brother of Judicael king of Brittany, died in the year 660. The ruins of the ancient walls, with which it was surrounded, still remain, and also an old castle flanked with turrets, concerning the origin of which antiquaries disagree. The barracks are the finest buildings in Pontivy.

When the National Assembly decreed that the old divisions of France should be abolished, and others substituted in their place, it gave the name of the department of Finistère^d to that part of Brittany which juts into the Ocean, like the promontory on the north-west of Spain, to which the ancients gave the same name (*Promontorium finis terræ*), because early navigators supposed it the limits of the earth. The department is bounded on the east by those of Morbihan and the North Coast, on the south and the west by the Ocean, on the north by the Channel. Twenty islands are situated on the coasts, and the indentations in the latter form more than fifteen capes. Shipwrecks are not uncommon; these bold coasts are every where composed of granitic rocks, against which impetuous billows are dashed. The soil, although moderately fruitful, produces plenty of grain, hemp and flax. The country is well supplied with wood; thick forests grow on the hills, and the vallies are covered with rich pastures. It possesses more valuable silver and lead

mines than any other department in France; it is also perhaps the most humid, or the one in which rains and mists are most common.

The Isole which flows with the rapidity of a torrent, and joins the Ellé, a small and tranquil river, is known in the lower part of its course by the name of the Laita; it falls into the Ocean. Quimperlé^e situated at the place where the two rivers meet, possesses a small but well frequented harbour inaccessible to vessels above fifty tons. The prosperity of the place may be attributed to its position. The streets are neat and clean; two in particular may be remarked for their elegance; the finest public buildings are a church, the ancient convent of the Benedictines, now changed into the residence of the subprefect, and a four-sided tower on the high road. It was the birthplace of Morellet, nephew to the celebrated Abbé of the same name,^f and a writer of considerable talent and erudition. Quimper, surnamed Quimper-Corentin after St. Corentin, its first bishop at an uncertain period, perhaps about the beginning of the fifth century, was formerly called Cornouailles; it was the capital of a country of the last name, that comprehended the whole of its diocese.^g The Romans called it *Corisopitum*, but before their conquest, it bore the Celtic name of *Kimper*, which signifies a *small walled town*; it appears, therefore, that its antiquity cannot be disputed. It is situated on the declivity of a hill at the confluence of the Odet and the Steire. The most ancient quarter, encompassed with walls and turrets, rises like an amphitheatre, and commands a view of a romantic country covered with rocks, woods and heaths. In the more modern quarter of St. Mathieu, the streets are not so narrow, and the houses are better built.^h The finest public walk extends along the canal of the Odet,ⁱ which the tide renders navigable to vessels of 300 tons. The cathedral was rebuilt at the commencement of the fifteenth century, and is one of the finest churches in France. The town has given birth to several distinguished men, among others to Bougeant and Hardouin, two jesuits; the first composed the admirable *Histoire du Traité de Westphalie*, and also the *Amusemens philosophiques sur le langage des bêtes*, on account of which his brethren banished him to La Fleche; the second author, more to be pitied for his singularity, than dreaded for any real or imaginary danger arising from his writings, attributed Virgil's *Æneid* to a monk of the thirteenth century, and considered the poem an allegorical description of St. Peter's journey to Rome. The same writer maintained that the acts of all the councils anterior to the council of Trent, were false; he was charitable enough to include Malebranche, Nicole and Pascal in the list of atheists. The jesuits allowed him to repeat these absurdities without molestation.^k Freron the ex-jesuit, and Valentin the painter, were likewise natives of the town; the latter during the civil dissensions in France, handled the pencil, the pen and the sword. Concarneau, situated on a small island, which communicates with the continent by means of a convenient ferry, is enclosed with walls, and guarded by a castle. It was taken by Duguesclin in 1373. It sends

such a manner as to facilitate communication between the inhabitants on the opposite sides of the streets."

ⁱ "The fine quays and the promenade which border the channel of the Odet, contribute to the commerce of the place and the recreation of its inhabitants."

^k "He published and repeated these absurdities without molestation"—This statement is not strictly true. Not only were the works in which he had denied the authenticity of the ancients and the councils, suppressed by authority, but he was compelled by his religious superiors to retract his opinions.—P.

^g Cornouailles is the name of a country in Brittany, comprehending all the former diocese of Quimper. (Encyc. Meth. Vosgien.)—P.

^h "In the old quarter, the upper stories of the houses project in

every year about four hundred boats and small vessels to the sardel fisheries, of which the mean annual produce amounts to a thousand tons. Douarnenez rivals the last town in the same sort of industry; it is partly peopled by two thousand fishermen and sailors.^a

There are no towns of any consequence in the district^b of Chateaulin. The capital of the same name, divided into two nearly equal parts by the river Aulne,^c is pleasantly situated; it was the birthplace of father André^d and rear-admiral Cosmao; the former obtained some celebrity as the author of a treatise on Man, and an essay on the Beautiful;^e the latter died a few years ago, after having distinguished himself in several engagements. The burgh of Huelgoet and the village of Poullaouen are two other places in the same district;^b the former is enriched by a mine of argentiferous lead; the other contains 3,600 inhabitants, almost all of whom are employed in working a similar mine, the largest in France, and one of the finest in Europe. It yields annually about 150 tons of lead, and more than 900 pounds of silver.^f The machinery used in the works, the founderies and the houses of the miners,^g are not unworthy of being visited. The small and dirty town of Carhaix rises on the left bank of the Hiere at the distance of eleven leagues to the east of Chateaulin. It has produced one of the greatest men of the last century, the brave La Tour d'Auvergne, distinguished for his learning^h and as a soldier, and a worthy descendant of Turcotte, who was proclaimed first grenadier of France, and who fell in 1799 at the battle of Neuburg.

Every stranger who has visited Brest, must have observed the fatiguing and uninterrupted motion which prevails in the port, the vessels that frequent it, displaying the colours of every nation, the imposing aspect of the batteries, which defend the town, the old fortress, according to popular tradition, erected by Cæsar, which guards the entrance, and the extensive road, communicating with the ocean by the strait called the Goulet, and capable of holding five hundred ships of war;ⁱ he may also have remarked the naval storehouses, the large arsenal, the barracks on the long esplanade, the cordage and sail manufactories, the large dockyards, and lastly the work-houses which may contain four thousand prisoners or galley-slaves.^k Brest is built on the declivity of a hill, and is divided into the high and low

town; the latter has been embellished with many modern houses; indeed the quarter of Recouvrance may ere long be compared with the one round the harbour, for it has been found necessary to pull down the ancient Gothic habitations in order that sufficient space may be obtained for new buildings.^l The steep and crooked streets in the upper town are very disagreeable and difficult of access. The fifth stories of several houses are on a level with the gardens belonging to others, and as the only communications between the old and new quarters are by means of long and open stairs, accidents are not uncommon during frosty weather. A fine machine for masting vessels may be observed at no great distance from the entrance into the harbour. One can hardly behold the solid and extensive quays, and the magazines or storehouses built of freestone, which line them, without rendering homage to the genius of Richelieu, by whom they were planned, and who foresaw the advantages that might be derived from the situation of a burgh, which he raised to the rank of a maritime town. It has been supposed, and in all probability correctly, that Brest is not so ancient a place as many believe; it cannot be inferred from the Roman fortress which still remains, that the town existed in the time of Cæsar; besides it may be shown that it was only a village in the ninth century, when king Coron Meriadec erected a castle near it.^m Louis Choquet, a poet of the sixteenth century, Rochon, a dramatic writer, and Lamothe-Piquet and Kersaint, two distinguished naval officers, were born in the capital of Finisterre.ⁿ

The isle of Ouessant^o may be seen from the coast of Brest; it contains about 1800 inhabitants, who are scattered in several hamlets. The road to the heights in the district^p of Morlaix, leads to Landernau which, although it has been extolled by an academician, must be considered an ill-built and disagreeable town. Morlaix is not so dirty as many other small towns in Brittany; it stands between two hills, about two leagues from the sea, and at the confluence of the Jarleau and the Kerlent, which enter its harbour; the latter is defended by a castle.^q Possessing a considerable trade, adorned with several fine edifices, and encompassed with agreeable walks, it cannot be denied that Morlaix is a pleasant and wealthy city. It was the birthplace of general Moreau, a Frenchman who betrayed

particularly in the quarter of Recouvrance,[†] in which the old Gothic houses are replaced by modern buildings, and which promises soon to rival the quarter near the harbour.[‡]

† "Quartier de Recouvrance"—Brest is divided into two parts, one of which is called the *Côte du Brest* and the other the *Côte de Recouvrance*, between which there is no communication but by boats. (Ed. Encyc.)—The town (*ville*) properly so called, consists of a small number of narrow and crooked streets built on the declivity of a hill. The suburb, called the suburb of Recouvrance (*fauxbourg de la Recouvrance*), consists of straight and well built streets. It is separated from the town by an arm of the sea which forms the harbour. (Encyc. Meth.)—P.

^m Conan Meriadec died A. D. 393. (Moreri.)—Conan Meriadec, a native of Great Britain, was created duke (*dux*) of the Armorican frontiers by the emperor Maximus about the year 383, and 26 years afterwards invested with the sovereign authority by the Bretons. He died about the year 421. (Beauvais.)—Conan I. who took the title of king of Brittany, was killed in battle A. D. 992. (Beauvais.)—P.

ⁿ Roelon de Chabannes, the dramatic writer, was born at Paris 1730. La Mothe (Motte-) Piquet was born at Rennes 1720. Kersaint was born at Paris 1741. (Beauvais.)—La Mothe-Piquet died at Brest 1791. (Diet. Hist. Caen, 1804.)—Quimper is the capital of the department and the residence of the prefect. Brest is only capital of an arrondissement or subprefecture. (Alman. Royal, 1822.)—P.

ⁱ Brest has two roads, the outer called Bertheaume Road, and the inner, Brest Water, the communication between them being by a narrow channel, called *Le Goulet* (the Gullet,) which is defended by a castle on a steep rock on the south side, and by a semicircular battery on the other.* Brest Water is capable of holding 500 sail of large ships. Tuckey. Vol. II. p. 19.—P.

* Guarded by a castle on the side next the sea, and on the land side by a large ditch and other strong fortifications. Ed. Encyc.

^k "The magazines for naval stores, the arsenal, the barracks fronting on a long esplanade, the two rope walks in a line parallel with the dock yards, and the prison for the galley slaves (*bagne*,) built near the summit of a hill, and large enough to contain nearly 4000 prisoners."

^l "Improvements are making more rapid progress in the latter, par-

his country, and was mortally wounded when commanding the enemies of France. St. Pol de Leon,^a the metropolis of a district,^b and formerly the seat of a bishopric, rises on a hill near the sea. The only buildings worthy of notice are the town-house, the ancient granite cathedral and the steeple of Creesker. The district of which it is the capital, has been long famous for its horses.

Several deep bays and important capes that jut into the Channel, are situated in the department of the North Coast.^c The arid, rocky and wild heights of Menez, Ar-rée and Menebrat cover a large part of its surface, and are the sources of three navigable rivers, namely, the Guer, the Trieux and the Gouet. The gentle declivities of the same heights terminate both on the north and the south in sterile sands, which extend to a considerable distance, but plains of great fertility may be seen beyond them, particularly near the coasts. Their products are flax, hemp, and different kinds of grain and fruits; in some places the country is covered with vineyards.^d The mineral riches of the department consist in iron and lead mines, in granite and slate quarries, and lastly in several medicinal springs of greater or less celebrity. The culture of the ground and the produce of the fisheries enable many to gain the means of subsistence; but other sorts of industry, the products of manual labor, the *Brittany linens* as they are called, have almost changed the department into a vast manufactory.^e

Although the district of which Laudeac^f is the chief town, and which extends below the southern declivities of the Armorican chain, may be considered the smallest in the department, no less than four thousand linen manufactories are contained in it. Uzel, near the banks of the Oust, is the principal mart for the different manufactures. The small town of Lannion stands on the banks of the Guer, near the shores of the sea, in a favourable situation for trade. The river Treguier serves as a communication between the port of the same name and the Channel. Guingamp on the Trieux may be remarked on account of the fruitful and romantic country in which it is situated.^g

St. Brieuc or St. Brieuc contains hardly ten thousand inhabitants; one cannot see therefore without surprise, a public library of 24,000 volumes, a collection of paintings, a theatre, an hospital and a fine granite bridge over the Gouet.^h It may be added too that there are horse races every year in the beginning of July; the horses that run, must be bred either in the department of the North Coast, or in the neighbouring departments of Finisterre, Morbihan, the Lower Loire, and the Ille and Vilaine.ⁱ The town also contains a school of hydrography, and an agricultural society. The harbour is at the village of Le Gué St. Brieuc. St. Brieuc was built at irregular intervals round

a monastery which dates from the fifth century; the streets are clean and straight, and, according to antiquaries, one of the parish churches now repaired, was originally a druidical temple.^k Paimpol on the coast, towards the north-west, contains 2000 inhabitants; the harbour is safe and convenient, and the mineral waters are held in some repute. Quintin,^l at the distance of four leagues to the south-west of St. Brieuc, has been long known for its fine linens; on the neighbouring hill are situated a castle of singular architecture, and two *peulvens* or druidical stones twenty-five feet in height, one of which is still erect. The small town of Lamballe to the east of the capital, was probably the ancient city of the *Ambiliates*,^m a people mentioned by Cæsar.

The districtⁿ of Dinan is the only other in the department; the town rises on a height near the left bank of the Rance; it has a harbour, from which there is a communication during high tides with that of St. Malo. It is noted for a strong castle, an ancient residence of the dukes of Brittany, the walls of which are remarkable both for their height and thickness. The public walks are extensive and laid out with much taste; but most of the public buildings are not very creditable to the town.^o Dinan has produced several distinguished men; it may be sufficient to mention Duclos, the secretary of the French academy, and Mahé de La Bourdonnaye, who was thrown by an ungrateful country into a dungeon in the Bastille, after having added to the glory of the French arms in India. Although the time in which Dinan was founded, has not been determined, it is certain that it was originally a Celtic city, probably the same which Ptolemy designates by the name of *Dianlita*. Mineral springs,^p which have been of late years much frequented, rise in a valley at a short distance from the walls. The old road to them was almost impracticable; a new and an excellent one was made by the states of Brittany.

The Ille and the Vilaine water a department,^q the last of those that are included in the ancient province of Brittany. The first river flows from north to south, and unites with the second, which takes first a western direction, and turns afterwards to the south. It serves, as well as the Cher and the Coesnon, to facilitate the conveyance of goods. Hills extend in different directions, and forests, landes and heaths make up nearly half of the country. The banks of the rivers are covered with rich pastures, and the fruitful marsh of Dol, the *Delta* of the department, yields abundant harvests, but even these are hardly adequate to the consumption. The working and smelting of iron, and different manufactures, particularly linen,^r have diffused wealth among the inhabitants.

As the people in the ancient city of *Aleth*, the modern St. Servan,^s were continually exposed to the attacks of

pirates, most of them removed, during the eleventh century, to the rock of Aaron, where they founded a small town, which was called St. Malo after the name of their bishop. The rock on which it stands communicates with the land by means of an embankment; the rough breakers on the north, and many batteries, render the access difficult to the enemy. The entrance to the narrow gulf which forms the harbour, is very inconvenient; on both sides are situated numerous shoals, and the waters are suddenly depressed or swollen by the tides; indeed, they have risen more than once to the height of forty-five feet above their ordinary level.^a The town rises like an amphitheatre; many of the streets are regularly built, and public walks extend round the ramparts. St. Malo has produced several remarkable men; among others, Duguay-Trouin, James Cartier,^b who discovered Canada, Maupertuis, a geometer and natural philosopher, La Mettrie, a physician, who was banished and died in exile, because he doubted the immortality of the soul, and lastly, the Abbé Trublet, an indefatigable compiler. St. Servant, not more than half a league from St. Malo, is a neat modern town with two harbours, one of them set apart for merchant vessels, and the other for those in the service of government. Caneale on the coast, at the distance of three leagues from St. Servant,^c supplies different places with oysters.^d Although the church of Dol may be compared with any other in the department, the town itself does not contain more than four thousand inhabitants.^e

The road from St. Malo to Paris passes through Fougères, which was almost destroyed by fires during the last century, calamities which account for its being at present one of the best built towns in the department. The public walks command a view of the neighbouring country, the fruitful valley watered by the Nançon, and meadows varied by groves; a fine forest in which are contained several druidical monuments, extended formerly beyond the village of Landean,^f where the cellars may be still seen that were dug in the twelfth century by Raoul, lord of Fougères, in order that his treasures might be hid from Henry the Second of England, but the monarch was more active than his enemy, for he seized the booty before it was concealed. Fougères has been long famous for different dyes, particularly for its scarlet, of which the brilliancy has been attributed to the quality of the waters of the Nançon. The sinuous course of the Vilaine leads to Redon, an agreeable and well built town, that carries on a

^a "The harbour is surrounded with rocks (*écueils*), and situated at the bottom of a narrow gulf, in which the sea rises at spring tides, 45 feet above its ordinary level; the access to it is consequently difficult."—The harbour is spacious, but of difficult access from rocks. ^g "Its port receives vessels of 200 tons"—Its port which serves as the entrepot for the commerce of Rennes, is accessible to vessels of 200 tons with full cargoes. (Vosgien).—P.

^h "Arrondissement"

ⁱ "Redon is the capital of an arrondissement, in which are situated the small towns of Renac and Bain, in the former of which a kind of

considerable trade with Rennes; it possesses a harbour for vessels under two hundred and fifty tons.^k Two small towns, Renac and Bain, are situated in the district,^l of which Redon is the capital; cheeses little inferior to those of Gruyeres are exported from the one, and the department is supplied with serge from the manufactories in the other.ⁱ Three other districts^k remain to be described; their chief towns are Montfort sur Meu, Rennes and Vitré; it may perhaps be worth while to add that they are all situated under the same parallel; the old fortifications in the first of these places are not wholly destroyed. The most important iron works in Brittany are those of Paimpont, a village about five leagues distant from Montfort sur Meu. The inhabitants of Plelan le Grand, another flourishing village, manufacture linens, thread, and other articles.^l These two villages are three times more populous than the chief town in the district.^h

Public walks on the banks of the Vilaine, communicate with Rennes, the capital of the department. The upper town, the finest part of the city, has been so called to distinguish it from the lower, which is situated on the left bank of the river, and is not unfrequently liable to inundations. The philosophical author of the treatise on Compensations, has omitted to state that many towns might not have been improved or embellished, had it not been for the devastations occasioned by fire. Thus, in the month of December 1720, all the upper part of Rennes was laid in ashes by a conflagration, which lasted several days;^m but the finest quarter of the city was builtⁿ in consequence of that calamity. The court of justice^o stands in a square, which may be compared with any other in France;^p the houses that surround it, are adorned with Corinthian pillars,^q which accord well with the architecture of the principal building. The different halls in the court are ornamented with paintings by Jouvenet and other French artists.^r The town-house, a larger and finer edifice than the last, forms nearly one of the sides in another square shaded by lofty lime trees.^s One of the wings has been set apart for the civil and commercial tribunals, and also for a public library, containing seventeen thousand volumes. Some of the works in the gallery of paintings are attributed to the great Italian masters; it is situated near the botanical garden, which contains many rare plants, and forms one of the most agreeable walks in the town.^t The establishments connected with instruction are an academy, a royal college, a scientific society, and lastly, schools of medicine, law,

cheese is made that is sold for that of Gruyeres, and the latter of which contains several manufactories of serges."

and the fine arts.^a Rennes is not only the seat of a court, but also the chief town in a diocese;^b it has produced several great men, among others, René de La Bletterie, the historian of Julian the apostate, Tournemine the jesuit, a person of great erudition, Caradeuc de La Chalotais, whose name is generally associated with the expulsion of the jesuits, and the principal events that preceded the revolution, St. Foix, the author of the essays on Paris,^c and Lanjuinais, a member of the convention, and afterwards raised to the peerage; the latter was distinguished for his eloquent speeches in the revolutionary assembly; in his various public employments he conducted himself as an enlightened philosopher and a virtuous citizen. The large prison^d in the ancient capital of Brittany, serves as a place of confinement to the culprits in the four departments subject to the jurisdiction of the royal court. If the canal between Rennes and St. Malo were finished, the trade of the town might be much improved. It may be almost unnecessary to mention that the capital of Brittany was connected with many important events in the history of France. The parliament of Rennes was instrumental in bringing about the convocation of the states-general in 1789. The inhabitants took arms for and against the king at different periods during the League.^e In the fourteenth century, it was invested by the English under the command of Lancaster, who were forced by Duguesclin to abandon the siege; but at a period anterior to the French monarchy, and even in the time of the Romans, several antiquities still preserved within the walls, prove that the town must have been an important place. The masters of the world called it *Rhedones*,^e because it was the chief town in the country inhabited by the people of the same name. It was called *Condate* by the Celts before the Roman conquest, probably on account of its position at the confluence of the Ille and the Vilaine. The hamlet of La Prevalaye is not more than half a league from Rennes;^f the neighbouring country has been long famous for its butter, which is said to be better than any other in France; it is mostly consumed in Paris.^g

Vitré,^h the only other place in the department that remains to be described, cannot be said to be either a clean or well-built town. It might almost be supposed that it had been made the capital of a district,ⁱ merely because the states of Brittany assembled there before the revolution. The house in which Madame de Sevigné used to reside while the states sat, perhaps the finest in the town, would be considered a very ordinary building elsewhere. From its appearance, one would be led to consider it as

^a "An academy, a royal college, a society of arts and sciences, a faculty of law, a secondary school of medicine,* and a school of fine arts."

* The schools of medicine in France are of two orders, viz: faculties and secondary schools, the latter subordinate to the former. In 1322, there were three faculties of medicine in France, those of Paris, Strasburg and Montpellier.—P.

^m "The cattle, sheep and swine are numerous and valuable; bees are reared on a large scale."

one of the oldest Armorican towns; some antiquaries even pretend to have discovered within its walls the remains of Roman edifices. It was the birthplace of Savary, the author of letters on Egypt. The neighbouring country has been much admired, and of late years much frequented on account of medicinal springs. Strangers visit the barony of Rochers, and the old castle flanked with towers, in which, it is said, several articles are carefully preserved, that belonged to the celebrated person, whose correspondence has become classical in French literature.^k

The Mayenne waters the department of the same name^l in all its extent from north to south; the soil and the vegetable productions are nearly the same as in the last; the vallies are fruitful in grain, but the vine gives place to the apple tree. Herds of oxen, and flocks of sheep may be seen in all the rural districts, and the peasants find the rearing of bees a profitable employment.^m The industrious classes manufacture flax, hemp and cotton.

The stranger looks in vain at Laval for straight or broad streets and houses at all worthy of an industrious and wealthy city. Situated between two hills, which enclose a fine valley, the Mayenne divides it into two parts, and waters a country as agreeable as the town is the reverse. The old and clumsy walls were built about the tenth century, when the town and the territory attached to it, were erected into a barony, which was made over in 1218 to a branch of the house of Montmorency; it became afterwards a county during the reign of Charles the Seventh.ⁿ The old castle that belonged to the dukes of Laval,^o rises in the middle of the town, on the banks of the river; it has been long used as a prison. The linen mart,^p a large and lofty edifice, was built by the dukes of La Trimouille, who succeeded those of Montmorency.^q The linens of Laval have been held in great repute for more than five hundred years; that branch of industry was first introduced by Guy the Eighth, lord of Laval,^r after his marriage with Beatrice of Flanders, from which country many weavers migrated and settled in the town. The fact, however, is little known by the townspeople, who in gratitude ought to have erected a monument to the great promoter of their prosperity. The public library consists of 25,000 volumes; the town has produced several distinguished men, but none perhaps more eminent than Ambrose Paré, the father of surgery in France.

The Mayenne waters the three principal towns in the department, and it may be necessary to remark that two of them, Chateau Gonthier and Mayenne, are six leagues distant from Laval, the one on the north, and the other on

ⁿ "This ancient barony, the walls of which do not indicate an origin anterior to the tenth century, was acquired by a branch of the house of Montmorency in 1218,* and erected into a county by Charles VII.†"

* By the marriage of Mathieu de Montmorency (II.) with Emma, only daughter of Guy V. last of the barons of Laval of the first branch. The barony descended to the children of this, his second marriage. Moreri.—P.

† A. D. 1429.

^o "to its dukes"—not dukes of Laval, but of La Tremouille. Francis, lord of La Tremouille, married Anne de Laval, second daughter of Guy XV. count of Laval; the house of La Tremouille thus became lords of Laval, by the extinction of the elder heirs of the house of Montmorency-Laval, and assumed, as one of their titles, that of count of Laval. Moreri.—P.

^p "Halle aux toiles"—linen hall.

^r Guy VIII. died in 1323.

the south. Thus, their relative situation tends to facilitate their commerce with each other. If the streets in Chateau Gonthier were straight, it might be an agreeable residence; it is separated from its principal suburb by the river; the great charm of the public walks consists in the view along the basin of the Mayenne; the banks of the river are shaded with walnut trees and orchards, or bordered with meadows, and are commanded by heights that contribute much to the beauty of the scenery. Craon, a small town of 3000 inhabitants, about four leagues to the west of Chateau Gonthier, was the birthplace of the celebrated Volney. Although the streets of Mayenne are narrow and crooked, the cleanliness of the houses may convince the stranger that he is no longer in the ancient province of Brittany. It was erected into a duchy^a by Charles the Ninth in favour of Charles of Lorraine, who in consequence assumed the title of duke of Mayenne. The ancient castle inhabited by the same duke and his successors, may still be considered one of the greatest ornaments to the town.

The Sarthe, which gives its name to a department^b contiguous on the east to that of the Mayenne, traverses it from north to south, and waters a very fruitful country, until it joins the Huysne;^c there the soil changes, and all the space between the latter river and the Loir is covered with sandy and sterile heaths. Wines of an ordinary quality, grain in sufficient abundance for the wants of the inhabitants, rich pastures,^d numerous flocks, and iron and coal mines,^e make up the territorial wealth of the department.

The small town of Mamers may be first mentioned, because it is situated in the most northern district^f in the department. It was probably founded a short time after the arrival of the Franks in Gaul; the Normans fortified it at a later period, and it has since been embellished with public walks, fountains and different buildings. Although La Ferté Bernard contains hardly 2500 inhabitants, it possesses linen and woollen manufactories, together with several corn and fulling mills, which are moved by the Huysne and the Mene. The inhabitants have formed by subscription a public library,^g a proof that industry is accompanied with the desire of knowledge.

Mans, the capital and the residence of the prefect, is advantageously situated near the centre of the department; seven high roads terminate in the town, and the lofty trees^h which shade them, add to the beauty of the neighbourhood. Narrow and crooked streets paved with pebbles, and almost inaccessible to carriages, indicate the antiquity of the quarter on the right bank of the Sarthe. The upper town is more modern; the houses are built of freestone, and covered with slate; but most of the public buildings are situ-

ated in the New Quarter, the finest part of the city.ⁱ The cathedral was built at irregular intervals, during a period of not less than six hundred years; it forms a combination of Roman and Gothic architecture, very interesting to those who study the history of the art. Rows of stone alternate with rows of brick; the circular arches in the interior, and the ogives in the exterior produce a singular effect, which accords very well with the dazzling colours of the Gothic windows. The mausoleum of William de Bellay,^k viceroy of Piedmont during the reign of Francis the First, a good general and an able diplomatist, may be considered the principal ornament in the interior. The house in which Scarron resided, whilst he was canon at Mans, is situated at no great distance from the cathedral. The promenade of the Jacobins,^l a walk shaded with lime trees and bordered by terraces, occupies the site of a Roman amphitheatre. The same town was the ancient *Suindinum*, the capital of the country of the *Cenomani*; under the Roman government, it was the second city in the third Lyonnaise. It was one of the principal towns in France in the time of Charlemagne; the Normans by whom it was almost ruined, made themselves twice masters of it.^m It was several times taken and retaken by the Vendean and Republican armies; the market placeⁿ was changed into a field of battle on the 13th of December 1793, when the soldiers of La Vendée, commanded by the prince of Talmont^o and La Rochejaquelein, yielded in the darkness of the night and after much slaughter to the troops commanded by Westermann and Marceau, against whom they had defended themselves during the whole of the day.^p The wax candles made at Mans are said to be the best in the kingdom, but that branch of industry is not confined to the capital of the department; the same articles are sent to Paris from some districts in the neighbourhood, and from Suze,^q a small town of 1800 inhabitants, situated near the extremity of the landes,^r on the banks of the Sarthe.

Encompassed with forests and sandy plains, the Anille waters a town^s which bore the same name as the river until about the sixth century, when a St. Calais founded there a monastery, and gave his own name to the town. An old church, a large square and two public walks are the greatest ornaments to the place. Besides the commerce arising from the linen manufactories, it carries on a considerable trade in grain.^t The inhabitants in the industrious burgh of Bessé, about three leagues towards the south, find employment in different manufactories, in dying cloth, and in making paper and wax candles.^u In the same district,^v beyond the southern extremity of the landes, nature, abounding in contrasts, has embellished the rich valley of

^a "Duché-pairie"—a title peculiar to the old government of Franco. The Peers of France were the princes and nobles, secular and ecclesiastical, who assisted at the coronation, and had a seat in the parliament. All the nobles, however, were not peers. the Loir; fields covered with grain, leguminous plants^a and fruits, hills adorned with vineyards that yield the only good wine in the department, fruitful orchards and rich meadows are united with romantic scenery. The chalky hills, cut into terraces, on the banks of the Loir, form a very singular appearance; houses of two stories are excavated in the declivities; the chimneys pass upwards to the fields, and clouds of smoke are exhaled from them. Chateau du Loir rises on one of these heights; industry and commerce have enabled the inhabitants to substitute new and commodious houses for old and inconvenient habitations; the town has been gradually renewed, and although it contains at present only about 3000 souls, it possesses a good classical seminary, an hospital,^b a theatre and public baths.

Passing through the same sort of country, the Loir flows below the small but neat town of Lude;^c at a greater dis-

(*Prytanée Militaire*.) and under the late government (1822.) the Royal preparatory military school of La Fleche (*Ecole royale militaire préparatoire de La Flèche*.) The pupils who have completed their course at this school, are admitted at the special military school of St. Cyr. The college which had belonged to the Jesuits, was converted into a military school on the suppression of that order.—P.

tance, La Fleche, a comparatively wealthy city, rises on the right bank; it is not however remarkable for its industry, for its only manufactories are one of black veils for nuns, two of glue, and some leather works. It is however a well built town, and the public library contains 22,000 volumes; but this capital of a sub-prefecture has acquired additional importance from the college founded by Henry the Fourth, and changed many years ago into a military school^d for six hundred pupils, four hundred of whom receive their education at the expense of government. Prince Eugene, the celebrated Descartes and Picard the astronomer were educated at the college of La Fleche. Sablé at the confluence of the Erve and the Sarthe, is the last place of any consequence in the western region of France; a fine bridge of black marble obtained from the quarries in the vicinity, is without doubt the greatest ornament to the town.

BOOK CXLIV

EUROPE.

Europe continued.—Kingdom of France.—Third Section.
—Central Region.

THE thirteen departments which make up the central region of France, formed eight provinces in the ancient monarchy: Orleanais, fruitful in corn and in vines, Touraine, called the garden of France, Berri, abounding in cattle, Nivernais, Bourbonnais and Marche, each of them enriched by commerce, Limousin, whose inhabitants supply by their industry the disadvantages of an ungrateful soil, and lastly, Auvergne, where the low lands are productive, and the higher districts, although not fruitful in grain, afford good pasturage. The same region does not differ widely from the last in extent of surface, and in the means of education provided for the people, but it is far inferior to it in the number of inhabitants, for the 4,165 square leagues that compose it, are only peopled by 3,789,000 individuals, which on an average does not amount to 910 persons to every square league.^a Thus it appears to be even more thinly peopled than the southern region; although no very favourable opinion can be inferred from such results, still this portion of France contains within itself so many resources, so much that may contribute to the expansion of industry, that its present depressed state cannot render an account of it uninteresting.

Almost the whole of Touraine, one of the smallest of the ancient provinces, is at present included in the department of the Indre and Loire, which these two rivers, together with the Cher, the Claise and the Vienne, traverse from east to west. The mildness of the climate, the fruitful vallies, the romantic banks of the Loire, on which the scenery has not been too much extolled by poets, and the varied productions inadequately described by geographers,^b render the country one of the most delightful in France. But the celebrity that has been conferred on the whole department, strengthened by the repetition of the same praises, may be reduced or more correctly estimated after a minute examination. The traveller, after leaving the banks of the Loire, whose majestic course is bordered by heights, covered with vineyards, orchards, castles and villages, and after passing through the vallies watered by the other streams that have been mentioned, will observe in other parts of the country, large tracts of uncultivated heaths, and will not therefore be surprised to learn that a region apparently so rich, which

^a It amounts to 909.7 nearly.—P.

^b “—the beautiful country on the banks of the Loire, whose scenery has been perhaps too highly celebrated, but whose fertility almost surpasses description.”

^c “—with its prunes.”—Prunes, or St. Catharine’s plumbs, constitute a lucrative branch of traffic, almost exclusively carried on at Tours and Chatellerault. Ed. Encyc.—P.

^d Encyclopédie Methodique: Dictionnaire géographique, art. Touraine.

has been almost compared to the promised land, and which supplies France and other countries with different fruits, does not furnish a sufficient quantity of grain for the consumption of the inhabitants. Thus the rich banks of the Loire may be said to resemble one of those magnificent frames which deceive the ignorant, and enhance in their opinion the value of a picture.

The following passage concerning Touraine, appears in a work that was published about forty years ago.^d

“The province was formerly enriched by different manufactures, such as leather, cloth, silk and ribbons; but all of them have fallen into decay; those of cloth and leather are no longer carried on. The silk looms amounted in the sixteenth century to eight thousand, the number of mills to seven hundred, and the individuals who found employment in manufacturing silk, to more than forty thousand, but the latter do not at present exceed two thousand. Of three thousand ribbon looms, there do not now remain more than fifty.” The inpolitic revocation of the edict of Nantes, and duties equivalent to prohibitions on foreign trade, have been so fatal to the department, that it has not participated in the immense progress that French industry has made during the last twenty years. The cloth, carpet and cotton manufactories, the paper mills and leather works^e are without doubt both more numerous and important than they were forty years ago, but they are not nearly so productive as might have been reasonably anticipated.

The state of the department justifies these reflections, although few towns in the kingdom can be compared with Tours on the banks of the Loire. The entrance into it is very imposing. A circus^f leads to one of the best built bridges in Europe, terminating in a spacious court^g that communicates with the Royal street,^h the finest in the town, and inferior to none in any other. Broad, straight, furnished with side walks, and lined with large houses, public buildings or well furnished shops,ⁱ it terminates in the road to Poitiers, along which an extensive range of lofty trees stretches to a green hill, surmounted with ruins, forming an admirable perspective. The *Tranchée*,^k an excellent road, cut through another hill, and bordered by a verdant slope (*talus*) and different buildings, extends from the same bridge, in an opposite direction; it leads to the telegraph, not an uninteresting object, but very different from the ancient ruins that

^e “Manufactories of coarse cloths, carpets, silks and cottons, cotton mills (*filatures*,) paper mills and tanneries.”

ⁱ “—with fine houses (*hôtels*,) and elegant shops.”

^k The Cut.

crown the other hill. The Royal street extends through the whole breadth of the town; several straight and modern streets cross it; but the old quarters consist of narrow and crooked lanes. The cathedral is an admirable Gothic edifice; the nave is of vast dimensions; the organ is remarkable for its size and ornaments, and the windows in the choir display the most dazzling colours. A very precious monument, illustrating the revival of the arts, may be seen within the same building; it is the tomb of Charles the Eighth and Anne of Brittany, his wife. The public library is one of the richest and most valuable in France; it contains more than 30,000 volumes, a great many copies of rare editions, and numerous manuscripts; among the latter, are the Hours^a of Charles the Fifth, those of Queen Anne of Brittany, and a book of the gospels, written in gold letters, on which the kings of France used to swear in the capacity of abbots and canons^b of St. Martin's church, where it was formerly preserved. The collection of paintings was removed a short time ago to a more commodious gallery; they are sufficiently numerous and of various styles, and some of them are by the greatest masters. Tours possesses a medical society, another of agriculture, and a third of arts and sciences; the last boasts of some distinguished members. Several celebrated men have been born in the town; among others, we may mention Destouches, a dramatic writer, Dutens, the author of different valuable works on numismatics,^c and the canon Grecourt, whose licentious poems find but few admirers at the present day. The period in which Tours was founded, has not been ascertained; Ptolemy mentions it by the name of *Cæsarodunum*, a name that was probably derived from the conqueror of Gaul; but it is not less probable that it was the capital of the *Turones*, at the time Cæsar entered their country. Can the Roman general be considered the founder of a town, which a short time after the conquest was a place of considerable importance in Celtic Gaul, which afterwards became the capital of the third Lyonnaise, and the name of which was distinguished by a Celtic termination? It is well known that the termination *dunum* indicates invariably a position on a height.^d Tours then, although at present on the left bank, was originally on the right bank of the Loire, perhaps on the very eminence where the telegraph has been erected.

Amboise, the ancient *Ambacia*, at the distance of five leagues to the east of Tours, has been considered by its townsmen, a place of greater antiquity, but the honours which they claim, are at best doubtful.^e Peopled by five thousand five hundred souls, and memorable from events connected with the troublous times of French history, it is as ill built as at the period when Louis the Eleventh instituted in its old castle the order of St. Michael. Charles the Eighth was born and died in the same edifice; there too

^a Breviary.

^b "First canons."—The church of St. Martin was abbatial and collegiate. The dignity of abbot was united to the crown of France by Hugh Capet. The dauphin was first honorary lay canon of the chapter. (Moreri.)—P.

^c Better known by his work, entitled: *Recherches sur l'origine des découvertes attribuées aux modernes*, in which he attempts to trace the principal modern discoveries and inventions to the ancients.—P.

^d The Gaelic *dun* is generally interpreted a fortress or fortified town, erected on a hill. In a note to the Death of the Sons of Usnach (*Oidhe Chloinne Uisneac*), a Gaelic tale published in the Transactions of the Gaelic Society of Dublin, vol. i., it is asserted that *dun* signifies a fort, fastness, mansion or tower, or simply any place shut in or enclosed. But as the forts of the Celts, as well as other ancient nations, were very uniformly erected on hills, particularly such as were insulated and abrupt, (witness the *Acropolis* of the Greeks and the *Capitol*

the conspiracy against the Guises proved abortive, a family that contributed by their intrigues to make the catholics and protestants of the same country, two hostile people, and that first rendered popular the reproachful epithet of Huguenots, by which reformed Christians have been since designated.^f One of the towers in the castle rises to the height of eighty-four feet; a spiral stair leads to the summit, which commands a view of the rich landscapes that border the Loire and the Cher. A well built bridge, finished in 1822, crosses the river and communicates with the road to Paris. Chateau-Renault, situated to the north of Amboise, is divided by the Brenne into the upper and lower town; the burgh of St. Patern^g at no great distance eastwards, contains 2000 inhabitants and more than twenty manufactories of woollen and linen stuffs. One of the streams that fall into the Loire, waters the small town or rather burgh of Luynes,^h which was erected into a duchyⁱ by Louis the Thirteenth, in favour of the constable D'Albert. It possesses a large hospital^k and several lace manufactories. Habitations similar to those that have been remarked in a neighbouring department, are dug in the depths of chalky rocks, and the ground above them is covered with rich vineyards. Paul Louis Courier, one of the most learned hellenists in France, and not less distinguished as a political writer, was born in the neighbourhood.

The small town of Langeais^l at the distance of some leagues from Luynes, carries on a trade in linen stuffs and earthen ware;^m it consists of a single street, and contains 2500 inhabitants. The old Gothic castle is still in a good state of preservation; it was built in the eleventh century; the articles according to which Brittany was united to France, and the marriage contract between the duchess Anne and Charles the Eighth, were signed in one of the halls on the ground floor, now converted into a stable. The other parts of the building have been changed into a prison. Although the town is included in the districtⁿ of Chinon, it is separated from it by the Loire, the Cher and the Indre. Chinon, situated on the Vienne, carries on a considerable trade in wines and also in the excellent prunes produced in the district. The walls which encompass it, are all that remains of the old fortifications. The venerable ruins of an ancient castle adorn the town; it was there that Henry the Second of England died in 1189; Joan of Arc presented herself in the same place before Charles the Seventh, and offered to deliver France from a foreign yoke. Chinon was the birthplace of the celebrated curate of Meudon.^o The minister of Louis the Thirteenth^p changed Richelieu, then a mere village, into a town; he embellished it with a castle, which has been since destroyed. The houses and streets are built with great regularity.

La Haye^q on the banks of the Creuse, has been surnamed

of the Romans,) the meaning usually attached to the word *dun*, including the idea of a height, may be considered legitimate.—P.

^e "Amboise—disputes with Tours the precedence in point of antiquity."

^f "—and there too the reproachful epithet of Huguenots, by which the Calvinists (*chrétiens réformés*) were designated, first became popular." The original does not say that the Guises rendered the epithet popular, but that it became so at Amboise. Moreri mentions among his etymologies of the name, that it was first applied by the courtiers, while the court was resident at the castle of Amboise.—P.

Descartes after the celebrated philosopher who was born within its walls, and whose house and modest furniture are still preserved with scrupulous care. Loches, the chief town in a district,^a that produces in abundance the excellent plums, which the French call the plums of Tours,^b rises like an amphitheatre on the left of the Indre. The square tower which commands it, was built by the Romans; it formed part of the castle in which Agnes Sorel used the empire of her charms to inspire her royal lover^c with the desire of glory. The building was converted into a state prison by Louis the Eleventh, and the Cardinal Balue, one of his ungrateful favourites, was confined there during eleven years, in an iron cage. The tomb of Agnes Sorel, which Louis the Sixteenth removed from the choir in the church of Loches to another part of the building, may now be seen at the residence of the subprefect; the epitaph attests that she was *charitable to all, giving largely of her wealth to the church and the poor.*

Blois, Vendome and Romorantin are the three principal towns in the department of the Loir and Cher, a flat and uniform country, but in some places varied by hills covered with vineyards, on which the eye rests with pleasure. The soil is much more fruitful in some parts than in others; the lands on the north of the Loire are very fertile, but on the south of the river, marshes, heaths and forests cover a third part of the soil.^d The country yields more corn than the inhabitants require, fruits and leguminous plants^e of every sort, a great quantity of hemp, different kinds of timber, and some good wines, particularly those of the *Côte du Cher*. Many sheep and oxen are reared;^f the turf pits^g are by no means unprofitable; iron mines are worked, and the flints in the chalky hills form an important branch of commerce. As a manufacturing department, it is not inferior to the last.

Different remains of antiquity render it probable that Blois was founded before the Roman conquest; in it, as in all the ancient French towns, the oldest buildings are situated on a height, and form a quarter consisting of steep and narrow streets; modern houses are erected below them; they extend to the quay on the right bank of the Loire, and to the bridge of eleven arches, the latter adorned with a lofty pyramid, and communicating with a suburb on the opposite side of the river. The lower part of the city is well built, and the views which it presents in different directions, are likely to impress strangers with a favourable idea of the place. The former church of the jesuits, built after the plans of Mansard, the Roman aqueduct dug in the rock, the public library, the prefect's palace in the highest part of the town, and the long walk which terminates in a large forest,

are well worthy of notice, but all of them are less imposing than the old castle, where the good Louis the Twelfth was born, which was inhabited by Francis the First and Charles the Ninth, and where too, during the last meeting of the states under Henry the Third, the Duke of Guise, and his brother, the cardinal,^h were assassinated by order of the king,ⁱ who was himself afterwards murdered by a bigot.^k The curious repair to the village of Chambord,^l about four leagues to the east of Blois, in order to see a castle which was built in the reign of Francis the First after the plans of Primaticcio;^m the monarch employed 1800 workmen during twelve years, his successors followed his example, and the edifice was completed by Louis the Fourteenth.ⁿ Although an irregular assemblage of towers and turrets, it is one of the most imposing Gothic buildings in France. A double spiral stair in the interior has been often admired; one person may mount and another descend it without seeing each other. The park round the castle is enclosed by a wall seven leagues in circumference. This fine domain was the residence of king Stanislaus; Louis the Fifteenth ceded it afterwards to Marshal Saxe, who died there in the year 1750. Napoleon presented it to the prince of Wagram;^o lastly, having been purchased by means of a national subscription, it became the appanage of the duke of Bordeaux. St. Aignan on the banks of the Cher, carries on a considerable trade in cloth and in flints, which are cut in the neighbourhood.^p

Ten^q manufactories render the small town of Romorantin a place of some importance; and it may be mentioned as a proof of its prosperity, that it has lately been embellished with several new streets.^r It is celebrated in history on account of the edict that was issued by the chancellor De l'Hopital, an edict that saved France from the horrors of the inquisition. The Loir divides itself into several branches near Vendome, which stands at the foot of a hill covered with fruitful vineyards. The town is well built, and the college is not inferior in point of architecture to any in France;^s the finest buildings are those in the vicinity of the horse-barracks, and no view near the town can be compared with the one, which may be seen from the ruins of the ancient castle.^t Vendome was the birthplace of the poet Ronsard.

A flat country, consisting of extensive and fruitful plains, with some narrow vallies of little depth, watered by different rivers, the largest of which are the Eure and the Loir, makes up the department of the same name,^u in an agricultural point of view, one of the most productive in France. It comprehends the greater part of the ancient Beauce and Perche. It furnishes corn in sufficient abundance for the consumption of the inhabitants, and exports besides a great

^u Department of the Eure and Loir.

quantity^a to Paris and the neighbouring departments. It has been proved by official returns, that the quantity of grain raised in the department of the Eure and Loir, is nearly three times greater than the average produce of the French departments. The inhabitants rear numerous flocks and herds; the quantity of wool exceeds twice the mean quantity in the other departments, and the same may be said of the number of horses that are bred in the country.^{b c} As the agricultural products are so abundant, it might be supposed that the inhabitants are not engaged in other occupations, but all the branches of industry are mutually connected with each other; thus, the mines furnish materials to several important iron works, and the wool, to cloth and different manufactories.^d It may be unnecessary to mention the vineyards, as all the wines are of ordinary quality; the quantity produced may be equal to 20,000 tuns; cider, however, is a very common beverage in different parts of the country.^e

The department of the Eure and Loir contains four districts.^f Nogent le Rotrou is the chief town in one of them; the houses are mostly well built; it stands in a fruitful valley watered by the Huysne and the Arcise; the latter turns several mills, and forms a cascade near the town. The Gothic castle, which commands Nogent le Rotrou, need not be mentioned on account of its architecture, but it may be remarked that it was the residence of Sully. There are no other towns of any importance in the same district.^g The burgh of Senonches is situated in the district,^h of which Dreux is the capital; the inhabitants carry on a trade in machinery and agricultural implements.ⁱ Maillebois has several cloth manufactories.

It would be a waste of time to inquire whether Dreux¹ derives its name from the Druids or from Dryus, the fourth king of the Gauls; the antiquity of the town cannot, however, be disputed; it is well known that it was called *Durocasses* before the Roman conquest, a name which was afterwards changed into *Droca*, and lastly into Dreux. The inhabitants carry on a trade in leather, printed cottons, woollen stuffs, stockings and hats, all of which they themselves manufacture.^k Rotrou the poet, and Philidor the musician and celebrated chess player, were born in the town. The battle in which the troops of Charles the Ninth took the prince of Condé^l prisoner, was fought under the walls in 1562. The ruins of the ancient castle that was inhabited by the counts of Dreux are still seen on a neighbouring height. The burgh of Anet is about three leagues to the north of Dreux; it was near it that Henry the Second built a noble residence for Diana of Poitiers, his mistress; what remains of it enables us to form some notion of what it must have been, in its original magnificence; it may be considered a monument of the foolish passion that the

king had for a woman who was not always faithful to him, and who was the cause of many disasters to France.

Epernon in the district^s of Chartres, contains about fourteen hundred inhabitants; it rises in a pleasant valley. Maintenon, somewhat more populous and still more agreeably situated than Epernon, was the native town of Colin d'Harleville. The castle, its finest edifice, was built in the sixteenth century; limpid streams water the park that surrounds it; there Louis the Fourteenth raised an aqueduct,^m now in ruins, in order to transport the waters of the Eure to Versailles; for that purpose he employed during several years more than sixty thousand soldiers, and a great many workmen. Several Druidical monuments are situated in a plain beyond the park; the country people call them the stones of Gargantua. Dirty and mean villages extend in different directions in the country between Maintenon and the capital of the department; they are built in the same manner as were those belonging to the *Carnutes* in the time of Cæsar; they consist of wretched hovels without windows, and made of clay mixed with cut straw, but what is very remarkable, the peasants who inhabit them, are not indigent.

The two towersⁿ of the cathedral of Chartres may be seen from the heights in the neighbourhood of Maintenon; they might be mistaken for two lofty obelisks. A small wood, the only remains of the ancient forest inhabited by the chief of the Druids, is in the vicinity of Chartres. The Eure, which flows below it, was the Celtic *Autur*, and the Latin *Autura*, whence the town was called *Autricum*, but the ancients also designated the latter by the name of *Carnutum*.^o An elegant square adorns the lower town, which is mostly well-built, but the upper town is formed by steep and irregular streets; in one of the narrow courts^p may be observed a monument^q erected to the memory of general Marceau, in every way unworthy of the young hero, whose ashes repose in a foreign land, and whose tomb was respected by the enemies he had defeated. The cathedral is the most remarkable edifice in Chartres; it stands in the highest part of the town, and the towers^r rise to a great height. It was founded in the eleventh century, and it was there that St. Bernard excited his hearers to engage in the second crusade; at a later period Henry the Fourth was crowned in the same place. Among the ornaments may be mentioned a white marble figure of the Virgin^r by Coustou, and in one of the small chapels, another Virgin with the infant Jesus. The last group and the relics of St. Vast are held in great veneration by the people.

The most valuable collections in the town, are a museum of natural history, and a public library, the latter consisting of about 30,000 volumes and 700 manuscripts. Chartres has produced several distinguished men; we may mention

^m "Behind the castle is a park watered by limpid streams, and traversed by the remains of the aqueduct"—undertaken by Louis XIV, A. D. 1684.—P.

ⁿ "Clochers." The principal curiosity of the town is the church of Notre Dame, with its two spires, one of which is the admiration of strangers, from its enormous mass, and from its pyramidal and finely tapering form, while the other is admired for the strength of its architecture and the richness and delicacy of its ornaments. (Ed. Encyc.)—There is a proverb in France: the steeples of Chartres, the nave of Amiens, the choir of Beauvais, and the portal of Rheims. (Encyc. Meth.)—P.

Philip Desportes and Regnier^a his nephew, two poets of the sixteenth century, Andrew Felibien, an author of considerable crudition,^b Thiers, better known as a critic than a theologian,^c Peter Nicole, an eminent writer of Port-Royal, Brisot de Warville and Petion de Villeneuve, two members of the Convention, and the virtuous defender of the unfortunate queen. The old ramparts of Chartres have been changed into public walks, which communicate with the lower part of the town; the gates are adorned with triumphal arches, and one of them flanked with turrets was connected with the drawbridge that was lowered before Henry the Fourth. The road to Brittany passes through Courville, a small city about four leagues to the west of Chartres. Sully died in the neighbouring castle of Villebon, an elegant and well preserved Gothic edifice of the sixteenth century.

The banks of the Loir lead to Bonneval, a burgh of seven hundred inhabitants, who carry on a trade in cotton, woollen stuffs and leather;^d broad, clean and well built streets indicate the wealth of the people. Chateaudun on the banks of the same river, was destroyed by fire in 1723, a calamity which has contributed much to its improvement; it is at present one of the finest towns in France. It has been made the capital of a district;^e it contains a townhouse, a public library and a college. The market-place must be considered the greatest ornament to the town both on account of its size, and the number of public buildings; a pleasant walk extends along the peaceful banks of the Loir, bounded by natural grottos, which have been converted into habitations for the peasantry.^f A castle rises on a rock that commands the river; it belonged to the counts of Dunois, and was built in the tenth century; there is not perhaps another edifice of the same date in France that can be compared with it.^g

A well-made road through no very picturesque country, leads from Chateaudun to Orleans, the chief town of a department,^h the name of which has been derived from the Loiret, a small river hardly three leagues in length from its source to its junction with the Loire, but which is navigable the distance of a league;ⁱ it has never been known to freeze, an advantage which renders it useful in more than one branch of industry. According to Lancelot and D'Anville, the ancient capital of Orleanais was originally called *Genabum*. Strabo informs us that the *Carnutes* held their principal markets there; it was embellished by the emperor Aurelian, who gave it the name of *Aurelianum*. It might have been destroyed in the year 450 by Attila, had it not been for the courage of the Roman general Aetius, who drove the Huns to the plains of Champagne, where he

^e Arrondissement.

^f "It contains a large and elegant public square, a town house and a college, both of them well built, a valuable public library, and a pleasant walk (*promenade*), commanding a fine view along the Loir, which there flows with a gentle current, and is bordered with grottos, now converted into habitations."

^g "On the rock which commands the town, rises the old castle of the counts of Dunois, one of the finest edifices of the tenth century."

^h Department of the Loiret.

ⁱ "More than a league."—It has a course of two leagues, and is navigable nearly to its source. Vosgien.—P.

^k "Since the time of the regent,* it has been merely a title, without any hereditary privileges."

* Philip, duke of Orleans, only brother of Louis XIV, regent during the minority of Louis XV.—P.

gained a complete victory over them. It fell under the power of Clovis after the destruction of the Roman empire, and it became after the death of Clovis, the capital of one of the kingdoms into which France was divided. Philip of Valois erected it into a duchy in favour of his son; having been united to the domains of the crown at the accession of Louis the Twelfth, this duchy became under Louis the Thirteenth, the appanage of his brother Gaston, and afterwards of Philip, the brother of Louis the Fourteenth; but the revenues were abolished during the regency, the title only has been retained.^k Orleans was the birthplace of king Robert, a distinguished scholar, and the author of several hymns, some of which are still sung in the churches; it was also the native town of the jesuit Petau, one of the most learned critics of his age, of Amelot de La Houssaye, an able commentator, and lastly of Pothier, the celebrated jurist. It stands at the extremity of an elevated plain, which terminates near the banks of the Loire; a bridge crosses the river opposite the town, and communicates with the road to Bourges. The extent of the suburb, which the stranger enters on the road from Paris, and the number of well-built houses contained in it, indicate the opulence of a large city. The monument in the square of Martroy was completed in 1803, and dedicated to Joan of Arc;^l the town has thus paid a tribute of gratitude to the heroine, who compelled the English to raise the siege in 1426. The finest street in Orleans is the one which leads from the same square to the bridge over the Loire. The cathedral was commenced by Henry the Fourth, and not continued until the reign of Louis the Sixteenth; although still in an unfinished state, it may be considered a model of architecture.^m The old ramparts have been converted into broad streets.ⁿ

As the seat of an university,^o Orleans is a place of some importance; the transactions published every year by the society of arts and sciences are not without merit; the botanical garden contains many valuable plants; the collection of paintings is superior to most of the same kind in the provincial towns.^p Although there are several rare works in the library, the total number of volumes does not exceed twenty-six thousand. The commerce of Orleans was formerly more flourishing than at present; the sugar works yielded greater profits, and a greater number of hands were employed in the shawl manufactories, but the difference in the other products of industry is less perceptible; the demand for cottons, woollen stuffs, flannels and fine cloths is at present almost as great as at any former period.^q Orleans was one of the first towns in France, in which steam engines were substituted for human labour in the spinning manufactories.^r

^l "The monument of Joan of Arc, in the great square of Martroy, was restored in 1803."

^m "If the cathedral, the building of which was begun under Henry IV, but has been discontinued since the reign of Louis XVI., were completed, it might be considered a model of architecture."

ⁿ "Boulevards."

^p "The collection of paintings is not without value."

^q The refining of sugar was carried on more extensively,† and a greater number of hands were employed in the manufacture of hosiery.‡ The manufacture of blankets and cotton coverlets, as well as that of fine cloths and flannels, is still of considerable importance."

† The sugar refined at Orleans was formerly esteemed superior to any other in France.—P.

‡ It was estimated on an average, that about 60,000 dozen pairs of stockings were made annually at Orleans. Savary, Dict. Comm. Etat Gen. tom. i., p. 37. 1741.—P.

^r "Filatures"—cotton mills.

A part of the produce of the neighbouring vineyards is converted into excellent vinegar, which forms no inconsiderable part of the trade of Orleans. The situation of the town on the banks of a large river may contribute to restore it to its ancient prosperity. The present commercial decline, whatever it may be, can only be imputed to the rivalry of other places in the same branches of industry.

The other towns or burghs in the same district^a may be briefly enumerated. Olivet on the Loiret was well known on account of an abbey, supposed to have been founded by Clovis. Francis, duke of Guise, was assassinated there, while he was making preparations for the siege of Orleans. The population of the burgh amounts at present to about three thousand souls. Meun^b was the birthplace of John,^c surnamed Clopinel, on account of his lameness; he enjoyed some reputation as a poet at the court of Philip the Fair. The town contains about five thousand inhabitants; it carries on a trade in leather and in different manufactures. Beaugency,^d perhaps more populous than the last place, is certainly more industrious; the vineyards belonging to the town yield generous wine; it possesses besides, cloth and serge manufactories, leather works and distilleries.^e The town must have been more important in the twelfth century than at present, for two councils were then held at Beaugency. It rises on a hill near the Loire, which is crossed by an old bridge of thirty-nine arches.

It might be almost unnecessary to mention Pithiviers,^f were it not the chief town in the district^g watered by the Ceuf, and the mart of the saffron collected in the neighbouring country, believed by many to be the best in Europe.^h Malesherbes, a burgh at no great distance from it, was adorned and improved by the lord of Malesherbes, the virtuous minister of Louis the Sixteenth.ⁱ Montargis is finely situated near a forest, and at the junction of three canals, namely, those of Briare, Orleans and the Loing;^k the only buildings worthy of notice are the theatre and a church that may be remarked for the boldness of its architecture. Châtillon sur Loing has a population of 2000 inhabitants; it was the birthplace of admiral Coligny. Gien, the capital of the smallest district^l in the department, has been embellished with a modern bridge over the Loire; the trade of the inhabitants is confined to porcelain.¹ Briare is about three leagues to the south-east of Gien; it rises in a valley near the junction of the canal that bears its name, with the Loire.

The country from the last town to Orleans, on the right and on the left of the Loire, is by no means fruitful;^m but on the north of this portion of the sterile Sologne,ⁿ the hills are

covered with vineyards, numerous herds are fattened in the meadows, and the fields at the approach of autumn display their waving harvests, and yield more than sufficient for the consumption of the inhabitants.

The department of the Loiret is contiguous to that of the Nièvre, for the distance of about two leagues. The latter department, situated to the south-east of the former, and formed by the ancient province of Nivernais, comprehends on the east the granite heights of Morvan, in some places covered with lofty forests which supply the Parisians with wood and charcoal, and in others with rich pastures on which the oxen are reared that are sent to the capital. The Yonne, the Aron, the Nièvre and the Loire compensate in some measure for the few and bad roads that traverse different parts of the country, most of which are impassable during part of the year. Many planks, united by flexible branches, and forming long lines,^o descend every year on the first of these rivers to Paris. Sandy but fruitful plains extend on the right of the Loire, which in a tract equal to sixteen leagues in length, bounds the department on the west. They produce enough of wheat, oats and wine for the wants of the people. The department abounds in coal and iron; wealth is thus diffused among the inhabitants; commerce and manufacturing industry are facilitated. Not less than fourteen hundred persons are employed in working metals, and the products of their labour represent a value almost equivalent to L.400,000.^p

Many of the iron works are situated in the district of Cosne;^q the town of the same name is the mart of the iron that is forged in the neighbourhood; it stands on the declivity of a hill, and the streets are clean and well paved; the inhabitants manufacture cutlery, and carry on a considerable trade in wine and grain. Although no remains of antiquity are left, it is certain that it was one of the seven or eight cities in Gaul, which were called *Condate*, a name probably signifying the junction of two or more streams; we have already had occasion to make the same remark in describing Rennes; it is alike applicable to other places that have not been mentioned. The Nohain throws itself at Cosne into the Loire; public walks have been cut on the banks of the river; the view from them extends over a fruitful country to the distant hills in the department of the Cher.^r A road from Cosne traverses the heights, which command the course of the Loire, the islands which it waters, and the romantic scenery near its banks; but the landscape becomes still finer above the descent that leads to Pouilly, or at all events, the gifts of nature appear in greater luxuriance; the

^p "9,000,000 francs."

^q "The arrondissement of Cosne is one of those in which there is the greatest number of forges."

^r "The public walk (*promenade*) along the Loire (*fleuve*) [the Nohain is only a *rivière*,] commands a fine view of the country on its banks, terminated by the distant hills in the department of the Cher."

hills are covered with rich vineyards, that yield the excellent white wines to which the last place has given its name.^a Pouilly does not contain more than two thousand six hundred inhabitants; it is about four leagues from Cosne, and at an equal distance from La Charité. In the latter town, which is finely situated on the banks of the Loire, the two most remarkable objects are the magnificent ruins of a Gothic church, and a well built bridge that joins the road to Bourges.

Clamecy, at the confluence of the Beuvron and the Yonne, is the metropolis of a district,^b and the place where the authorities regulate the cuttings in the forests of Morvan.^c It carries on a considerable trade, and possesses several cloth manufactories and porcelain works;^d thus, although the town is small, the inhabitants are comparatively wealthy. The suburb of Bethlehem has derived its name from its having served as an asylum to the bishop of Bethlehem, after the expulsion of the Christians from Palestine. It was the native town of Marchangy, a magistrate and a man of letters. Corbigny on the small river Anguison, which throws itself into the Yonne, has been long famous for its horses.^e

The district^f of Chateau-Chinon owes its wealth to its forests and meadows. The capital of the same name, a small town situated at no great distance from the sources of the Yonne, stands on a hill commanded by well wooded heights. The inhabitants carry on a trade in wood, charcoal and cattle, a trade which the supply of Paris renders very lucrative. A bad road leads from the town to Nevers, the birthplace of Adam Billaut, a carpenter, whose poetry bears the stamp of genius; he is known in France by the name of the rustic Virgil.^g The town was called *Noviodunum* in the time of Cæsar, who places it in the country of the *Ædui*,^h but its name was afterwards changed into *Novirum*, and lastly into *Nevirum*. It did not become a place of any importance before the reign of Clovis. About the tenth century, William, one of its governors, rendered himself independent, and took the title of count of Nevers. It contained only seven thousand inhabitants about forty years ago, but since that period the population has been more than doubled; the increase must be attributed to the effects of commerce and industry, both of which might be still much

^a "The road from Cosne crosses an extensive plateau, from which the Loire and the islands it encircles, are continually in view; a finer landscape presents itself on reaching the descent that leads to Pouilly, the environs of which are covered with vineyards that yield the excellent white wines that bear its name."

^k "Its porcelain (*porcelaine*) and enamel are celebrated. It manufactures with small glass pearls, different articles of jewellery,* in which an extensive trade is carried on both in France and in foreign countries. Its pottery (*faïences*, delft) is considered the best in France, and the manufacture, as M. Dupin remarks, has been in a flourishing condition for eight centuries. There are not less than ten establishments, engaged in this manufacture; they furnish employment to 700

workmen, and consume annually 32,000 kilogrammes of tin, and 135,000 of lead."^l
 * The boasted manufactory of enamel is nothing more than the blowing of glass toys with the blow pipe. *Ed. Encyc.*—P.
 † *Faïence* (delft ware,) a kind of varnished or enamelled pottery, originally made at Faenza in Italy, and since at Delft in Holland, the last in imitation of the Chinese porcelain; whence its French and English names. There may be manufactories of genuine porcelain at Nevers, but they must be of recent establishment, for in the authorities I have consulted, (Peuchet 1805, Vosgien 1813, and the older ones, *Encyc. Meth.* 1784 and Savary 1741,) only *faïence* is mentioned.—The manufacture of delft in Nevers is the oldest in the kingdom. It was originally brought from Italy by the dukes of Nevers, who were natives of that country. *Encyc. Meth.*—The original manufacture certainly was not porcelain, for the first European porcelain was made in Saxony, where the process of making it was first discovered by Bœticher, in the early part of the last century.—P.

improved. Nevers has been long celebrated for enamel and different articles of jewellery; they are sold in most parts of France, and exported into different countries. The porcelain works in the same place are supposed to be the best in France; the most ancient of these works, as M. Dupin remarks,ⁱ was established eight centuries ago; they furnish employment to seven hundred workmen; the quantity of tin consumed annually, amounts to 72,000 pounds, and the quantity of lead to 337,500.^k It is sufficient to pass through the town to be convinced of the truth of an observation made by a distinguished writer.^l "At Nevers," says he, "there are lamps which are never lighted, a bridge over the Loire, which is never repaired,^m and an enormous calvary raised in the worst taste in the market place." The people in the town have given or allowed the magistrates to take L.1500ⁿ for the purpose of erecting this calvary; it might have been better had they laid out the money in purchasing oil, and in lighting their crooked and ill paved streets.^o

The Allier, the *Elaver* of the ancients, throws itself into the Loire at the distance of a league to the west of Nevers; it crosses from south to north, the department to which it gives its name,^p and which is contiguous on the south to that of the Nièvre. It makes up almost the whole of Bourbonnais, a country well known on account of its mineral springs, coal-pits and iron mines. Many oxen are fattened in the pastures, and the horses are remarkable for their strength. The oaks are used in building ships, and the rivers and ponds supply Paris with excellent fresh water fish. The inhabitants are employed in different branches of industry; iron is converted into steel, raw silk into different manufactures, rocks into mill-stones, and clay into porcelain.^q But agriculture has long remained stationary; it may be regretted that the system of husbandry has not been improved, that the rich lands in the vallies, and the sandy but fruitful soil which covers the granite rocks, yield so scanty harvests.^r

Moulins was founded in the fourteenth century; it derives its name from the great number of mills (*moulins*) round the place where it was built. Robert, the son of St. Louis, founded there an hospital, and the princes of the house of Bourbon, long lords of the province in which it

workmen, and consume annually 32,000 kilogrammes of tin, and 135,000 of lead."

^q "Its steel is converted into cutlery, its silk into ribbons, its sandstone into millstones, and its clay into pottery (delft)."
^r "Stationary in its agriculture, it does not derive all the advantage it might, from the fertile soil of its vallies, and the sandy soil which covers its granite rocks; still its produce in grain and wine is more than sufficient for the wants of its inhabitants."

was the capital, at different periods embellished it. The streets are well paved; although the houses are built of brick, and the outer walls fantastically divided into red and black compartments, they are better than many in other provincial towns. Several of its finest edifices are built of stone; among others that may be mentioned, is the former convent of the Visitation,^a now changed into a college;^b the church attached to it is adorned with different ornaments, particularly with the fine mausoleum of the last constable Montmorency, who was beheaded at Toulouse during the administration of Richelieu. The townhouse, another stone building, has been lately erected in the principal square.^c The town is the seat of a bishopric; it possesses a museum, a collection of natural history, a library of twenty thousand volumes and a theatre. It was the native town of John Lingendes, a poet of the seventeenth century; his verses are seldom read, but they evince no ordinary talent;^d it was also the birthplace of Marshals Villars and Berwick. A four-sided tower, now changed into a prison, is all that remains of the ancient castle which the princes of Bourbon inhabited. The bridge over the Allier is little inferior to any in France; it is about 257 yards in length, and nineteen in breadth;^e it consists of ten arches, and the opening in each exceeds twenty yards.^f

Two excellent roads bordered by lofty poplar trees terminate at the bridge; the one on the left leads to Clermont, and that on the right to Limoges. The latter first traverses Souvigny, a town of 2700 inhabitants, where the Gothic church served formerly as a place of interment to the princes of the house of Bourbon. The town is situated at no great distance from the capital of the department, and the inhabitants carry on a considerable trade in soda and glass.^g Bourbon l'Archambault in a fruitful valley about three leagues from Souvigny, is visited during the summer and autumn^h by invalids, particularly by those afflicted with rheumatism and palsy; it is supposed that the thermal springs may mitigate, if they do not remove these diseases. The church is adorned with finely painted windows, but the clumsy and ill built houses appear as old as the town, which was founded about five hundred years ago. The castle that belonged to the princes of Bourbon is no longer habitable, although three of the towers are in a good state of preservation.ⁱ The population amounts to three thousand individuals. The poor but laborious inhabitants in the burgh of Lurey-Levy find the means of subsistence in making porcelain and earthen ware; some of them are employed in the coal mines in the vicinity.^k

La Palisse,¹ a small town in the eastern part of the department, is the capital of a subprefecture; it is watered by the Besbre, and commanded by the ruins of an ancient castle. Cusset, on the banks of the Allier, has from its walls and

ancient fortifications, the appearance of a strong town; it contains about four thousand inhabitants. Many persons resort every summer to Vichy, a fashionable watering place at no great distance from Cusset; it is situated in a romantic country, where the painter, the botanist and the geologist may find subjects of study in their respective pursuits.

Gannat might be passed over in silence, if it were not the residence of a subprefect. St. Pourçain, in an agreeable valley, is famous for its cattle fair, held during the last days of August. Crowds of well-dressed peasantry repair to the market place, while the idle are attracted by strolling players or mountebanks; tables and tents are set in the plain, where the excellent white wines of Lachaise form the ordinary beverage; in one place the noise of music and dancing is heard; in another the galloping of horses, which those who mean to purchase, try beforehand; the oxen are prized for their strength, not for their fatness; indeed they are never bought by the butcher; the peasantry use them in the plough. The singular costume of the men, the fresh and fair complexion of the women, the cries of different animals, and the confused voices of the multitude, bear no resemblance to the village festivals in the neighbourhood of Paris.^m

Mont-Luçon, the capital of a district,ⁿ is surrounded by walls flanked with towers. In its vicinity^o is situated the burgh of Neris les Bains, the name of which has not been changed^p since the time that Julian rebuilt it after it had been sacked under Constantine the Second. It is at present peopled, as in the time of the Romans, by invalids subject to rheumatism and cutaneous diseases. Several remains of antiquity, such as an amphitheatre, and the traces of a Roman camp (*castrum*), prove that Neris must have been a considerable town, before it was laid waste by Clovis, and at a later period by the Normans. Although there are no public baths, each inn is provided with a large apartment for eight or ten bathers. *Piscinae*,^q similar to those that existed in ancient times, are reserved for the use of the hospital, into which more than a hundred and thirty patients are gratuitously admitted.

Unproductive in corn, and destitute of wine, for which other fermented liquors afford but a poor substitute, the department watered by the Creuse,^r must be considered a sterile country; it is certain too that a tenth part of the labouring population migrate every year into other parts of France, but they seldom fail to settle afterwards in their native land, where they improve by judicious investments the fruits of their economy and industry. The soil may be arid and mountainous, but the love of country makes it appear less ungrateful than it really is; on that account numbers return to their hills and vallies, and cultivate joyfully the field which their labour has enabled them to purchase. The working of metals is not attended with profit in the

^r Department of the Creuse.

department, but from the low rate of wages, it is well adapted for other branches of industry; the art of making carpets has been brought to great perfection; the same may be said of paper and different manufactures.^a

The four principal towns^b are of little importance, and the country is of such a character as to present few objects for description. Aubusson, watered by the Creuse, and situated in an arid and unfruitful district, rises in a defile formed by naked granite rocks; it consists merely of a single street, which, it must be admitted, is broad and well built. Louis the Fourteenth gave it in exchange for St. Cyr to the Marshal de Lafeuillade, the last descendant^c of its ancient viscounts. The carpets made in the royal manufactory are equal to any in France;^d fifteen other manufactories of the same kind diffuse the means of subsistence among the inhabitants. The places of amusement are three coffee-houses, a theatre and a literary club. Felletin, a small place of three thousand inhabitants, not more than two leagues from Aubusson, rivals it in the same sort of industry. Bourgneuf may be mentioned on account of two porcelain works and a paper manufactory; it is remarkable too for a tower of very large dimensions, which according to tradition was built by Zizim, the son of Mahomet the Second,^e who found refuge in France during the reign of Charles the Eighth. Gueret is the capital of the department; the streets are well built and watered by fountains; it is a place of little or no trade; although fuel is very cheap in the neighbourhood, no manufactory or work of any kind has been erected near the town. Boussac contains fewer inhabitants than the capital of any other district^f in France; it stands on a rock and is almost inaccessible to carriages; surrounded with walls, flanked with towers, and commanded by an old embattled castle from which the view extends along a defile formed by arid and wild mountains, the town is as gloomy a residence as can be well imagined.

There are few departments so well wooded as that which derives its name from the Cher;^g it has the advantage too of abounding in iron and other minerals.^h The uniformity of the country is in some places broken by hills; the lands on the east near the banks of the Loire, which forms the eastern boundary, produce the richest harvests; on the south and the south-west are situated a great many ponds, and the soil is of an ordinary quality; on the north and the north-west are numerous marshes encompassed with sterile landes and heaths; a fruitful country in the centre extends along the banks of the Auron and Cher. On the whole, an ungrateful soil in many places, but in others sufficiently productive,ⁱ covers two-

^a "The manufacturing industry does not consist in the working of metals, as in the neighbouring departments, but the low price of labour has made it the seat of important manufactories of carpets* and paper, both of which are in high reputation, and of different establishments for spinning wool and cotton."

* "Tapisseries"—carpets, hangings, &c. The department was formerly noted for its raised tapestry-hangings, called Aubusson tapestry (*tapisseries d'Aubusson*); but the manufacture is now almost entirely confined to carpets and furniture tapestry Peuchet, p. 168.—P.

^c "Only descendant."—Louis XIV ceded Aubusson in exchange for St. Cyr to the Marshal La Feuillade, who assisted in forming the *Place des Victoires* in Paris. This marshal was Francis, viscount d'Aubusson and duke de La Feuillade, who had three sons, the second of whom succeeded him in his titles. The latter was born in 1670. Louis XIV founded a nunnery at St. Cyr, for the education of the daughters of military officers, the buildings of which were completed in 1686. Encyc. Method. Moreri.—P.

^d "—have been long celebrated in France." See note ^a. *

^e Brother of Bajazet II. by whom he was forced to take refuge in Italy, where he died, it is said, of poison. Beauvais.—P.

thirds of the surface; the remaining portion is abundantly fruitful. The inhabitants derive their wealth or means of subsistence from the products of their iron works, from their wool and from the culture of the ground, but bigoted to old prejudices and to routine, they do not derive all the profits which might be obtained from a better system of husbandry.

St. Amand, one of the most commercial towns in the department, rises in an agreeable valley at the confluence of the Marmande and the Cher. It is the mart of the grain, wine, chestnuts, timber and cattle in the surrounding district;^k most of the inhabitants are consequently engaged in trade. It was built in the year 1410 on the ruins of the burgh of Orval, which the English had destroyed by fire. Dun le Roi,^l on the right bank of the Auron, was in ancient times one of the most celebrated cities in Aquitaine. The prosperity of Sancerre depends on its trade in wine;^m it is built on the highest hill in the department, at the distance of a league from the left bank of the Loire. Ivoy le Pre is a populous and flourishing burgh; the inhabitants find occupation in making glass; others are employed in iron works, where the different pieces that form the parts of the steam engine, are forged.ⁿ

The interest excited by an industrious population, and that attached to historical recollections, are not often united in the same place; other manufacturing towns,^o therefore, such as Aubigny, Henrichemont and Precy, may be passed over in silence, for several places in the neighbouring district^p of Bourges, possess the double interest which has just been mentioned. Bourges, it may be remarked, is situated in an agreeable position on the declivity of a hill, watered by the Auron, at the very place where the river receives several other streams. It is surrounded with a thick wall flanked at regular distances with eighty lofty towers, all of which are in a good state of preservation. Divided into the old and the new town, it might be inferred from their superficial extent, that they could contain a greater population than that which has been assigned to them, but they exhibit nothing which renders it at all doubtful that Bourges is one of the dirtiest towns in France.^q It is the seat of a royal court, an archbishopric, an university,^r a royal college, and a scientific and agricultural society;^s it possesses besides a valuable library, a collection of natural history,^t a theatre and a large hospital,^u all of which are situated in the midst of low houses and narrow streets. Two edifices only are worthy of fixing the attention; the one is the cathedral, and the other the town-house. The first may be ranked among the finest Gothic monuments in Europe; it is surmounted

by two high towers; the front cannot be considered free from the irregularity, which disfigures almost all the churches of the same period, but it is remarkable for the delicacy and finished workmanship of the ornaments; one of the sculptures on the portal represents the last judgment. The town-house was the residence of the celebrated James Cœur, one of the wealthiest merchants in France during the reign of Charles the Seventh; he managed the king's finances, and was treated as a court favourite, until he granted a loan of 200,000 gold crowns to his sovereign. As a recompense for this service he was accused of several imaginary crimes, deprived of his wealth, and confined in the Franciscan monastery at Beaucaire; many however sympathized with him in his sufferings; indeed he was so much esteemed that the merchants of Beaucaire enabled him to escape from confinement,^a and furnished him with money, as a means of settling in a foreign land, where he might forget the country which he had loved, and the base ingratitude of a prince, whom he had had the misfortune to oblige. The house was purchased by Colbert, who made it over in 1679 to the mayor and aldermen of Bourges. Every part of the building is richly decorated; the walls are covered with a profusion of ornaments, among which, hearts are not the least conspicuous, probably because the original proprietor's name was Cœur. The chimneys represent towers and the gates of cities guarded by soldiers.^b A bad portrait of Bourdaloue, painted by himself, has been placed in the interior. The same celebrated jesuit, the fathers Deschamps,^c Souciet and D'Orleans, the treasurer of Charles the Seventh,^d and Louis the Eleventh,^e who founded the university of Bourges in 1466, are the most distinguished persons that the town has produced.

According to Livy, Bourges must be one of the oldest cities in Gaul; at the time of the Roman conquest, it was called *Avaricum*, and was the principal city of the *Bituriges Cubi*; the Romans gave it the name of *Bituriges*; Augustus made it the capital of Aquitania, and the roads to Bordeaux and Autun passed through the town. It was embellished with an amphitheatre, for which a castle was substituted in the eighth century; it is not more than forty years ago since the same castle was destroyed.^f The capitol built by the Romans stood on the site of the town-house.^g It became at a very early period the chief town in a diocese which was founded by St. Ursin in the year 252. Chilperic having taken possession of it, plundered the inhabitants, and burnt the houses, but they were rebuilt and improved under Charlemagne and Philip Augustus. The public walks of Villeneuve,^h so called from the name of the prefect, by whose directions they were made, are very ornamental to the town.

Mehunⁱ is situated below Bourges, at the place where the Auron joins the Yevre, and forms a large basin^k well adapted

for the purposes of commerce; the inhabitants carry on a trade in hemp, wool, timber, and the products of their manufactories.^l The site and some vestiges of the castle may still be seen where Charles the Seventh, fearing that his son Louis the Eleventh intended to poison him, starved himself to death in the year 1461. The population of the town does not exceed three thousand individuals. Vierzon stands at the confluence of the Yevre and the Cher, the last of which waters the most fruitful and agreeable district in the department; although it contains only four thousand five hundred inhabitants, it has cloth and serge manufactories, others of porcelain and earthen ware, iron works, paper mills and tan-pits.^m

Woods and forests occupy more than a seventh part of the surface in the department of the Indre: the country on the right bank of the riverⁿ is covered with ponds and marshes, which diffuse dangerous and pestilential vapours in the atmosphere; but it is chiefly in the territory of Brenne, between the Indre and the road to Limoges, that these large sheets of shallow water occasion in the summer season noxious exhalations, of which the effects are often fatal to man and the lower animals. Government has not hitherto attempted to drain these marshes, a work which might be accomplished without much difficulty; and if the health of the inhabitants is not a matter of concern to the state, the hope of profit may perhaps excite it to undertake the task, for more than thirty thousand acres^o of land might thus be restored to agriculture. The lands in the other parts of the department are chiefly sandy; they yield more grain than the inhabitants consume; the wines are of an ordinary quality, but the excess of the vintage above the consumption is equal to at least one half. Sheep and oxen are reared in great numbers in the rural districts.^p

Issoudun, as the chief town of a district,^q cannot be passed over in silence; it was destroyed by fires in the years 1135, 1504 and 1651; it possesses at present four cloth and three linen manufactories, one porcelain and seven leather works.^r

Some antiquaries affirm that the name of Levroux has been derived from the great number of lepers, who, it is supposed, inhabited the town about the twelfth century; but according to others the place was so called from an hospital for lepers, which was built there about the same period; it is certain that the town bears the name of *Leprosium* in some old charters, and it is not improbable that the same circumstance may have attracted the attention of antiquaries to a subject of little or no importance; it would have been a more interesting object of inquiry to have ascertained what was the name of Levroux in the time of the Romans. The present population does not amount to more than three thousand inhabitants, but the ruins of an amphitheatre, and other remains of antiquity prove that it must have been an

important city under the Cæsars.^a It is surrounded by walls flanked with towers, and encompassed with ditches. A road that passes through vineyards and woods leads to Valençay,^b in which the castle built by the house of Etampes^c and since embellished by Talleyrand, served as a residence to king Ferdinand the Seventh of Spain from the year 1808 to 1814. The number of inhabitants is nearly equal to three thousand;^d many of them are employed in manufacturing cloth.^e The most extensive iron works in the department, are those in the neighbouring village of Luçay le Mâle.^f The chief town in the district^g of Buzançois contains four thousand inhabitants; the trade of the place consists in wool, iron and flour.^h

The town of Chateauroux in the districtⁱ of the same name is situated on the left of the Indre, which flows through the middle of a low plain covered with rich meadows. It derives its name from Raoul de Deols, by whom it was founded in the tenth century. A castle which he erected on a neighbouring hill, is now occupied as the prefect's residence.^k Cloth is the principal article of trade, and there are not fewer than thirty-five manufactories. The Creuse waters Argenton, a small town of four thousand inhabitants, at the distance of six leagues to the south-west of Chateauroux. It may be inferred from several medals and sculptures that have been discovered at different times, and also from the ancient fortress which was demolished by Louis the Fourteenth, but of which some ruins still remain, that the town was more important in the time of the Romans. It was then called *Argentomagus*, and it lay between the territories of the *Bituriges* and the *Pictavi*.

Two districts^l remain to be described. La Chatre, the capital of the one, is a small but neat town on a gentle declivity near the left bank of the Indre; it was formerly defended by a strong castle, but the only part of it which now remains, has been for many years used as a prison.^m Aigurande, an insignificant town near the southern extremity of the department, may be mentioned on account of an ancient octagonal monument, concerning which no tradition has been preserved by the inhabitants, but which was probably set apart for sacrifices or other religious purposes. The Creuse divides Leblanc,ⁿ the capital of the other district,ⁱ into the upper and the lower town. St. Benoit du Sault,^o between the last river and the Anglin, is considered a town by the inhabitants, although it does not contain more than twelve hundred individuals; it is situated in the most picturesque part of the department; indeed nothing can be more romantic than the scenery near the rocks and the cascade of Montgermo.

^a A plate of copper bearing the following inscription, was discovered there at the commencement of the seventeenth century; *Flavia Cuba, Firmiani filia, Colozza Deo Marti suo, hoc signum fecit Augusto.*

^b Valençay.

^c The Estampes of Valençay were a younger branch of the family, the first of whom, Louis d'Estampes, was lord (*seigneur*) of Valençay, the fourth, James d'Estampes, marquis, and the seventh, Henry d'Estampes, who continued the line after the death of his nephews without issue in 1700, count of Valençay.—P.

^k The castle—was erected by one Raoul (*Radulphus*), whence the town took the name of Chateau-Raoul (*Castrum Radulphium*, *Radulph's castle*), since corrupted into Chateau-Roux. Moreri.—P.

The department of the Upper Vienne, a mountainous country, abounds in metals, in rocks useful for building or other purposes, and in kaolin which is used in many porcelain works; but the land is ill adapted for grain or the culture of the vine, and the produce does not supply the consumption of the inhabitants; chestnut trees, however, occupy a surface of more than 120,000 acres,^p and yield annually about 25,000 tons^q of chestnuts, which make up for the deficiency in grain; fruitful meadows also enable the proprietors to rear many horses, most of which are much valued on account of their strength.^r The people are frugal and laborious; many masons, carpenters and other artisans annually leave the country, and obtain employment in most parts of France. Such are some of the characters by which the department of the Upper Vienne may be distinguished.

The district^s of Bellac may be first described, because it is contiguous on the north to the department of the Indre. The town stands on the declivity of a steep hill above the Vinçon, a small river or rather a rivulet; it possesses several leather works, some paper mills, linen and woollen manufactories.^t The vineyards in the neighbourhood yield wines of a good quality. A fine monument of the druidical worship may be observed at no great distance from Bellac, near the village of La Borderie. Dorat is a small town of three thousand inhabitants; the people manufacture cloth and cotton stuffs; they also carry on a trade in weights, measures and barometers.^u The village of Darnac contains more than two thousand inhabitants; it has risen into importance from its glass and porcelain works.^v It may not be difficult to infer from this account of the principal places, some notion of the commerce and industry in the district.^w

A short distance above Limoges, the capital of the department, the Vienne waters an agreeable valley covered with artificial meadows and bordered by low hills. The town rises like an amphitheatre on one of the sides of the same valley, and the streets are consequently steep and crooked; if they are clean, it may be attributed to the streams that water the town; its situation on a height renders the air keen and pure, the chief cause perhaps of the health of the inhabitants, and of the beauty for which the women are famed. Several different squares and public walks are situated in the highest part of the town; one of the former^y occupies the site of a Roman amphitheatre. The church of St. Martial may be admired for its lofty spires; it belonged formerly to an abbey of which the ruins still remain; the cathedral is an imposing Gothic edifice, but the church of St. Martin is perhaps the finest and certainly the oldest

of the three. It might be difficult to discover a fourth public building at all worthy of notice.^a Limoges possesses, however, other titles to celebrity; it may be sufficient to mention the academy,^b the royal college, the museum of antiquities and natural history, the public library, the royal nursery, the gratuitous schools of drawing and of geometry in its application to the arts, the anatomical school, the dispensary, the lunatic asylum, the society of agriculture and the sciences, and what is not perhaps the least useful, the society for the relief of prisoners. At certain seasons, the town is crowded with strangers and country people who attend the races, in which the only horses that are allowed to run, are those bred in the department and nine others in the neighbourhood;^c much about the same time, a cattle show takes place, and prizes are awarded to those who exhibit the best oxen.^d The number of woollen manufactories amounts to thirty-two, and there are not fewer than eleven porcelain works. The distinguished men that the town has produced, are the carmelite Honoré de Sainte Marie,^e the author of three quarto volumes on different military orders, Dorat the poet,^f the chancellor D'Aguesseau, and Marshal Jourdan.

Ratiatum, a town which Ptolemy mentions, appears to have been built on the site of Limoges;^g the Romans gave it the name of *Lemovices*, by which they also designated the ancestors of the present Limousins. It must have been a flourishing city in Cæsar's time, for he says that the territory furnished ten thousand men to the confederation of the Gauls.^h It was laid waste in the fifth century by the Visigoths; the English obtained possession of it in 1360 by virtue of the treaty of Bretigny, but it was restored nine years afterwards to the kings of France. St. Leonard, the second town in point of importance in the district,ⁱ is about seven leagues above Limoges, on the Vienne; it is encompassed with agreeable walks, and contains several manufactories, and at least six thousand inhabitants.

Rochechouard^k lies to the west of Limoges, near the frontier of the department; it is built on the declivity of a hill, and commanded by an old castle, which the English besieged in vain during the reign of Charles the Fifth. The present name of the town is derived from *Rupes Cavardi*, the ancient name of the castle.^l Twelve burghs are situated in the district of which Rochechouard is the capital; the country abounds in iron ore; several iron works and manu-

factories account for the industry and comparative wealth of the inhabitants.^m St. Junien, a small city, but more populous than the last, is encompassed with ramparts;ⁿ it rises like an amphitheatre on a hill at the confluence of the Vienne and the Glanne; it has twelve cloth and two flannel manufactories, five paper mills and two porcelain works.^o It carries on a considerable trade in horses and mules. The district^p of St. Yriex,^q not less industrious than that of Rochechouard, abounds in kaolin, of which the discovery made in 1770 by Villars, a druggist at Bordeaux, has greatly increased the number of porcelain works in France; almost all of them are supplied with that substance, as well as with petuntse, from the district^r of St. Yriex. The town, although wealthy, is ill built; it owes its origin to a monastery founded in the sixth century in honour of the saint whose name it bears.

The Correze has its source, and also its termination in the Vezere, in a mountainous department,^s ill provided with good roads or navigable rivers. The inhabitants fatten several thousand oxen in winter, and send them to Paris in the spring of the year; they supply besides the maritime towns of Bayonne and Bordeaux with salt meat,^t and furnish walnut oil to different departments. These products indicate at least the abundance of walnut trees and the richness of the pastures. The country may be divided into two distinct regions, the one on the south-west, and the other on the north-east of the road to Limoges.^u If a traveller ascend the Correze, he may observe on the right of the same road, mountainous and sterile districts which occupy nearly two thirds of the department, and which the peasantry call the *Montagne*; the second or the *low country*, as it has been termed, consists of cultivated lands and fruitful vineyards, but it does not produce enough of grain to supply the consumption.^v In the former, the scenery is wild and romantic, and the inhabitants are thinly scattered; in the latter the population is more concentrated, almost all the ground is cultivated, and mills^w are erected on the different streams.

The road from Limoges traverses the small but neat town of Uzerche, which does not contain more than two thousand inhabitants; it stands on the declivity of a hill above the Vezere; all the houses are covered with slates; the most of them are flanked with turrets,^y which gives the town a singular appearance, and attests its antiquity. Be-

^a "Besides the church of St. Martial, remarkable for its lofty steeple, and which belonged to an abbey formerly venerated in the country, the cathedral, an imposing Gothic edifice, and the church of St. Martin, the oldest of the three, Limoges possesses no other edifice of any importance."

yond Uzerche, the same road passes through a picturesque country, intersected with the ravines and precipices that are formed by the last heights in the mountainous region. The cathedral of Tulle was built in the ninth century; it is chiefly remarkable for the height of its tower, which can, however, be seen from the road only at the distance of three miles.^a The town owes its origin to a monastery, that dates from the seventh century, and to the destruction of another and more ancient city, of which all that now remains, are the ruins of an amphitheatre and other buildings about half a mile from the walls.^b The present city is dirty and ill built; the streets are crooked and narrow, and in many places very steep.^c There are several paper mills, woollen manufactories, distilleries and leather works; the inhabitants also carry on a trade in walnut oil and horses. Tulle has produced few distinguished men, and certainly none during the last or present century, but it may perhaps be worth while to mention Stephen Baluze,^d who was sent into exile for having written a genealogical history of the house of Auvergne, in which he supported the claims of Cardinal Bouillon, who, it was asserted, could not be subject to the king, because his father was prince of Sedan before Tulle was united to France.^e

The Correze, below Tulle, waters the neat town of Brives la Gaillarde,^f the birthplace of Cardinal Dubois, General Treillard and the unfortunate Marshal Brune. Lubersac, about eight leagues north of Brives, contains three thousand inhabitants; general Souham may be mentioned among its distinguished townsmen. Turenne, at the distance of three leagues from the chief town in the department,^g has given its name to one of the greatest generals that France has produced.^h The population does not exceed sixteen hundred individuals; the ruins of a castle, probably one of the most ancient fortresses in France, are situated on a steep rock that commands the town; the largest tower in the same castle is about a hundred feet in height, and is called the *Tower of Cæsar*.

Few places of any consequence can be mentioned in the mountainous region; Ussel, the capital of a district,ⁱ is surrounded by arid summits, and watered by the Sarsonne, over which a bold and elegant bridge has been erected since the revolution.^k Bort^l is about five leagues to the south-east of the last town; it stands in a fine position on the right bank of the Dordogne, and it boasts of being the birthplace of Marmontel. About a mile and a half below Bort, the Rue, a small river, forms a fine cascade, called the *Saut de la Saule*.^m

The different ramifications of the Cantalⁿ extend over the department, which bears the name of the mountain^o—a noble

^a "Half a league."

^c "The town has a mean appearance, and consists of steep streets, on the declivity of a hill"—at the confluence of the Correze and the Solanes.—P.

^d Etienne Baluze, born 1630, died 1718.

^e Literally—"who considered himself independent of the king, because he was born of a prince of Sedan before that town [Sedan] belonged to France."—Emm. Theod. de La Tour, Cardinal of Bouillon, third son of Fred. Maurice de La Tour, duke of Bouillon and prince of Sedan, was born 1643. His father, who had been arrested for engaging in a plot against Cardinal Richelieu, gained his liberty only by ceding the principality of Sedan, of which he was independent sovereign, to Louis XIII. in 1642, consequently the year before the birth of Cardinal Bouillon. He however made the cession on condition of retaining the dignity of Prince of Sedan. Having again joined the enemies of the king, he finally made peace with him in 1651, by receiving in exchange for Sedan, several large estates in France, among others, the barony of La Tour and the county of Auvergne. This final cession by treaty, in which he resigned the dignity of prince, as well as the sovereignty of the principality, explains the last clause of the original, which would be obviously in contradiction with the first ces-

monument of the volcanic convulsions, to which the centre and the south of France were exposed at a period, when the soil was covered with the sea.^p The sides of these heights, formed by porphyry, basalt, lava, scoriæ and pumice, are frequently beaten by violent winds, and the snow on their summits remains nearly eight months in the year. Limpid springs issuing from the depths of the earth, give birth to numerous rivulets, which by the cascades they form in different directions, add to the beauty of varied landscapes. The same streams, precipitated into the vallies, fertilize the pastures which they water, and give rise to several rivers. The northern declivities furnish the principal streams of the Rue, a feeder of the Dordogne; the latter river receives also the Maronne and the Cere, which descend from the western vallies. The eastern vallies supply the sources of the Truyere, which throws itself into the Lot, and of the Alagnon, which runs in an opposite direction, and is joined by the Arcueil, before it falls into the Allier. The vallies on the south are watered by different small streams that enlarge the Truyere. The thermal and medicinal springs that issue from the sides of the same mountains, are considered salutary in different diseases. The vallies watered by the streams and rivers which have been just enumerated, are in general fruitful, but most of the grain that the inhabitants consume, is produced in the Planeze, a small plain watered by the Alagnon and the Arcueil.

The higher vallies, the different heights, and even the summit of the Plomb,^q the latter the loftiest and the most central mountain in the group of the Cantal, abound in rich pastures and meadows that are covered with numerous herds, even with those from the neighbouring departments. The oxen fattened in these pastures are sold in every part of France, while the sheep are sent to the southern parts of the kingdom; kid and goat skins, articles of commerce in the country, are converted into parchment at Milbau.^r The horses, although of a small size, are strong and well adapted for light cavalry. The people in the *Burons* or cottages that are scattered in different parts of the pastures, convert their milk into butter and into cheese of three different qualities. The husbandman cultivates rye and buck-wheat, which constitute the principal food of the peasantry, flax which rivals in fineness that of Flanders, hemp which is woven into coarse cloth, either employed in the navy, or sold to the Spaniards, potatoes, fruits of different kinds, particularly chestnuts, the last of which make up no small part of the consumption, and lastly some vineyards, that yield only wines of inferior quality. Copper kettles and different culinary utensils of the same metal, together with

sion by compulsion in 1642. The first clause of the original is explained by the following circumstance. The cardinal, having fallen into disgrace with Louis XIV., resigned his offices and quitted the kingdom, in doing which he wrote to the king that he resumed the liberty which his birth and his quality of foreign prince gave him. I have allowed the translation, altogether inaccurate as it is, to remain unaltered.—P.

lace and paper, are almost the only articles that are made in the department; the coal pits are not of much importance, no other mines are worked; thus for want of employment, many individuals leave their country; the most of them follow the trade of copper-smiths or braziers in different parts of France, in Spain, and even in Holland.^a

The fifteen hundred inhabitants of Maurs in the southern part of the department,^b rear a great many pigs, and carry on a considerable trade in bacon. From Maurs, which is situated at the base of the mountains, the traveller can ascend into the high country, where he may pass through towns little worthy of being examined in detail, and where the majestic spectacle afforded by the remains of ancient volcanic eruptions is likely to reward him for his labour.

At the extremity of the picturesque valley watered by the Jordanne, he may traverse the broad but irregular streets of Aurillac. The theatre has been considered too large and too much ornamented for the capital of so poor a department; ^c the town rests on lava, which large lakes have covered with thick strata of calcareous sediment. The hippodrome beyond the walls has been set apart for horse races, which take place every year, from the first to the fifteenth of May inclusive. It appears very improbable that Aurillac was founded before the eighth century.^d Pope Gerbert who took the title of Silvester the Second, Marshal Noailles, Piganiol de la Force,^e and the infamous Carrier were born within its walls. Basaltic lava arranged in colonnades may be observed in the immediate neighbourhood of the town; two mineral springs rise in the suburbs, the use of which is recommended in different diseases.

It is almost impossible for a stranger to travel the winding and narrow roads in the department of Cantal without a guide. Vic en Carladez, a small town of two thousand five hundred inhabitants, called also Vic sur Cere, because the Cere passes through it, is much frequented on account of its mineral waters. It is about nine miles from Aurillac; the women in the intermediate villages are celebrated not only for their beauty and fresh complexions, but also for their graceful demeanour.

The elevation of the Plomb du Cantal is about 6,036^f feet; any one who ascends it, may discover the ruins of a colossal volcano, overlaying a granitic mass. St. Flour is situated above the valley watered by the Dauzan, on the summit of a basaltic hill nearly three hundred feet in height. The number of inhabitants does not amount to more than seven thousand;^g it is the chief town in a district consisting of eighty-two burghs and villages.^h All the houses are built of lava; but, although the seat of a bishopric, it possesses no edifice of any consequence. It has, however, produced two celebrated men, namely, the dramatic poet Du Belloy, and the brave Desaix who fell at Marengo. The

^a "The only mines worked in the department, are those of coal;* but many individuals annually leave the country, and follow the trade of braziers in other parts of France, and also in Spain, and in Holland."

inhabitants manufacture copper utensils and coarse cloths; they also prepare glue, and arcluilⁱ for dying.

Chaudes-Aigues rises in a deep defile, watered by a feeder of the Truyere; it was known to the Romans, who gave it the name of *Calentes Aquæ*.^k It does not contain more than two thousand individuals, but the thermal springs, which are held in great repute, attract during the summer season, a number of invalids at least equal to the number of inhabitants. These springs issue from volcanic rocks, and their temperature varies from twenty to sixty-five degrees of Reaumur. Their sanative qualities are not their only virtues;^l they are used in cooking, in washing, and in every domestic purpose for which warm water is required; lastly, they are introduced into each house by subterranean pipes, and thus serve to warm the lower rooms during winter.

The Alagnon waters a pleasant valley at the base of the Plomb du Cantal, and near the Puy du Peroux. Murat, the chief town in a subprefecture, stands on the right bank of the same river; the men are employed in making copper utensils, and the women in working lace; the latter occupation serves to recal that sort of industry which was first introduced by Colbert into Upper Auvergne.^m The Puy-Mary, a volcanic peak, rises on the opposite side of the Col de Cabre in the districtⁿ of Mauriac. The small town of Salers in the same districtⁿ is built on a current of lava;^o it gives its name to the mountains in the neighbourhood, where the finest cattle in Auvergne are reared. The mountaineers are said to be quarrelsome and prone to revolt, defects which may be attributed to an insulated situation and the want of education.^p Mauriac, a small town, is situated on the side of a basaltic hill,^q which commands an extensive and magnificent view. In the vicinity are the romantic valley of Fontanges, and the water-falls of Salins; a labyrinth of deep glens and precipitous rocks stretches to the banks of the Rue, and exhibits all the variety of forms that are to be found in volcanic countries.

Vallies watered by small streams separate the group of the Cantal from that of Mont-Dor; the immense labyrinth, which they form, leads from the department of Cantal to that of Puy de Dome.

Having arrived above the region of the fir, pastures cover the sides of all the mountains^r which are grouped round the Puy de Sancy; their bases form a plateau with a southern inclination. Herds of cattle are seen at distant intervals, and a few scattered cottages serve to vary a dreary country, in which the traveller cannot find a single tree to shelter himself against the rays of the sun. The picantry who inhabit the mountains, repair to a Gothic chapel, built in the sixteenth century; great numbers perform a pilgrimage to it every year;^s on Sundays and other days, consecrated to divine service, many mountaineers meet at the same place.

^h "It is the chief town of an arrondissement composed of 82 communes."

^s "It is celebrated in the country for an annual pilgrimage."

A cottage, which has been dignified with the name of an inn, may be seen near the chapel; it is frequented by pedestrians in their excursions to Mont-Dor, and by all those, whether natives or strangers, who require something stronger than the limpid water which flows from a neighbouring spring. On the approach of winter, the peasantry abandon their mountain cottages, the chapel is closed until spring, and the deep snows render the roads impassable. At some distance from the chapel, is situated the Trou de Soucy, a natural excavation in the form of a funnel, about a hundred feet in diameter, and terminating in a gulf or pit not less than eighty feet in depth. The extent of the cavity cannot be ascertained, but to judge from the prolonged noise occasioned by the discharge of a gun, it must be considerable. It would be wrong to consider this excavation as an ancient crater; it may be also remarked as the most curious circumstance respecting it, that it is filled to the depth of at least six feet, with limpid water, the temperature of which too is always much lower than that of most of the springs in the country; but the phenomenon may be easily explained, from the fact that the porous lava which lines the cavity, promotes evaporation. The country people affirm that the gulf communicates with the waters of Lake Pavin, a lake which in appearance at least, resembles a crater. It is situated at the bottom of a circular cavity, not less than a hundred and twenty feet in depth. The sides of the cavity are well wooded, and the luxuriance of the vegetation which covers them may be attributed to the moisture exhaled from the waters; the banks of the lake are formed by the lava, which flowed from the sides of the Puy de Monchal, a neighbouring volcano. The black waters of the lake, fed by no visible spring, and continually discharged by an adjoining outlet, form the Couse, a small river, which fertilizes the neighbouring meadows. A limpid stream feeds the lake of Mount Sineyre, at no great distance from the last, but there does not appear to be any outlet to the waters which it continually receives.

Few travellers visit the volcanic heights^a that encompass Mont-Dor without ascending the Puy de Sancy, of which the pyramidal summit is apparent from every part of the surrounding country. The rocks that compose it, are impressed with all the characters of an igneous origin; the groups of Mont-Dor and the Cantal may be said to attest those great convulsions of nature, of which the volcanos now in action can furnish but an imperfect idea. No craters can be seen; the fused substances, raised from an immense depth, and forced through the superincumbent granite, exhibited probably after their consolidation enormous and rugged masses, which the action of the atmosphere and of ages has scattered in every direction. These masses, once so awful from their height, and imposing from their extent, now present only broken skeletons, whose pointed peaks threaten to overwhelm the vallies below them. The eastern declivities of the Puy de Sancy are not very precipitous, and the chairmen in the valley to which visitors resort on account of the thermal baths, have frequently carried ladies to the summit. The verdant slopes are covered with thick and tufted grass; a sheet of water formed by all the springs which descend from the higher

declivities, occupies a small part of a lofty plain, where the traveller rests before climbing the peak. It often happens that those who commence their journey at day-break, when no clouds appear on the mountain, and when they expect to be rewarded for their labour by a magnificent and extensive view, find themselves on reaching the summit of the volcanic pyramid, where a cross formed of the same substance has been erected, suddenly involved in a dense fog which prevents them from discovering even the narrow path by which they have ascended. The inscriptions on the four sides of the cross are then only visible; from them they may learn that they have ascended 2720 feet, that the rock on which they stand, is 109 feet higher than the Plomb du Cantal, 1368 higher than the Puy de Dome, and 6136 above the level of the sea, and lastly, that they have reached the highest point in central France. If the sun's rays dissipate the clouds collected around them, they may see on one side the romantic valley of Mont-Dor, and beyond it an almost boundless horizon, and on the left, the valley of Enfer, frightful from its depth and from the rugged rocks that surround it. Having left the Pic de la Croix,^b the traveller may wander through meadows, where golden ranunculus and potentilla contrast with the verdure of the other plants. Only a few scanty tufts of vegetation issue from the crevices in the valley of Enfer,^c and from the steep rocks which border that of La Cour, whilst in the ravines above their frightful precipices, the snow remains even in the month of August. The view from the slippery declivities on the western side of the valley,^d extends over deep and sequestered vallies, while the cattle on the heights seem almost suspended from pastures, on which man cannot walk without fear. The shepherds frequently drive a stake into the ground above these precipices, and attach themselves to it by means of a cord; they are thus enabled to mow the grass which grows in almost inaccessible situations, but which the wind too often scatters before they have time to collect it.

The highest part of the valley of Mont-Dor is watered by the small river Dor; it is formed by a number of streams collected on the Puy de Sancy, from which it descends in cascades through a vertical fissure in the midst of rugged rocks. Fir trees cover the base of the mountain; a rapid stream, which the inhabitants call the Cascade of the Serpent,^e winds in the shade of their dismal foliage on the right of the Dor; it is almost concealed in many places by tufts of the broad-leaved *cacalia* and the blue flowering *sonchus*. Below it and on the same side of the valley, the waters of the Dogne fall from a height of not less than a hundred and sixty feet; they mingle near the fall with the waters of the Dor, and form the Dordogne. The Capuchin, a rock composed of porphyritic lava, so called because one of its fragments,^f when seen from a distance, has some resemblance to a monk in the dress of that order, rises on the opposite bank of the river. The village of Bains fronts the same rock; a walk lately planted with trees leads from it to the banks of the Dordogne, across which an iron bridge has been erected. Since the new baths were constructed on the site of those that were built by the Romans, the village has been enlarged and embellished, and has now become a place of

^f "A prism detached from the mass."

resort for strangers from the beginning of June to the middle of September. The baths form a simple and at the same time a solid and elegant edifice; they are built of a dark coloured lava, and covered with large and thin stones^a of the same substance; on the whole, they are not unlike the buildings of the Romans. The pilasters and arcades in front correspond well with the columns and other remains of an ancient monument, which probably formed part of a temple that some wealthy Roman erected on the square before the new edifice, to commemorate a cure which, it was supposed, the waters had effected. The varied and picturesque sites in the valley and neighbourhood of Mont-Dor are visited by the strangers who frequent the baths; the exercise which they take contributes perhaps as much as the thermal springs to the improvement of their health. Few persons leave the country before they have seen Lake Chambon in which the river Couse has its source. The romantic scenery near the lake, accords so well with the views which Sidonius Apollinaris describes round his house, that there is every reason to believe that its banks were inhabited by that celebrated prelate of Gaul,^b who flourished about the middle of the fifth century.^c

We may pass from the valley of Mont-Dor to different places not unworthy of notice in the district of Issoire.^d St. Nectaire, a small burgh famous for its cheese, contains the remains of several Roman baths, which serve to prove its antiquity. One of the five or six rivers in the department, called the Couse,^e traverses Issoire, a town that was founded before the conquest of Gaul, and to which the Romans gave the name of *Issiodurum*.^f The church appears to be of an architecture anterior to the Gothic; mosaic ornaments are observed on the outside, and the twelve signs of the Zodiac are represented on the walls; Virgo and Libra adorn the principal front. The Latin names of these signs, sculptured in Roman characters, are proofs that the church was built at a very remote period; the choir rests on a subterranean chapel. The town is embellished with several broad and well built streets, besides fountains, squares, a fine public walk and a covered market place, built of granite. Issoire was the birthplace of Anthony Duprat, chancellor of France, who after the death of his wife, entered into holy orders, and became a cardinal; he abolished the pragmatic sanction, rendered offices venal, increased the imposts, and lived long enough to be execrated by his countrymen. Iron and coal mines are worked in the neighbourhood of Auzat on the right bank of the Allier. More than a million of bottles are made every year at the glass works of La Combelle in the same district.^h Sauxillangesⁱ contains about two thousand inhabitants; they carry on a trade in earthen ware, saws, scythes and woollen stuffs of their own manufacture.^k

The Allier, a broad but shallow river, winds through Li-

magne; it is bordered on the left by granite rocks which rise perpendicularly near the village of St. Yvoine, and threaten to overwhelm both the boatman who steers his bark, and the traveller who pursues his journey along the road^l on the banks of the river. The burgh of Vic le Comte is built on the right bank beyond the village; it may be mentioned as the birthplace of the immortal Lesage. Billon,^m a town of five thousand inhabitants, and supposed to be the most ancient in Auvergne, is situated on an eminence, about two leagues distant from the Allier. It may be seen from the summit of the Puy de Corent, a mountain of the absolute height of about nineteen hundred feet, composed of lime and sandstone, which were originally deposited by the fresh waters that covered the whole of Limagne, and crowned with lava and basalt. Billon was formerly celebrated, and it has again become so of late years, on account of a college under the direction of the jesuits. At the time of their expulsion, a picture was found in the college church, of which many engravings were afterwards sold in France; it represented religion under the emblem of a ship guided by the jesuits. The principal articles made in the town are silks and porcelain of admirable fineness.ⁿ

The road to Clermont passes along the base of Gergovia,^o a calcareous and volcanic mountain; the name serves still to indicate the site of the principal city in the country of the *Arverni*, a city that Cæsar besieged without success. It was built in a plain on the mountain,^p of which the absolute height is not less than two thousand three hundred feet. The site is accurately described in the Commentaries; the country people have often found there broken *amphoræ*, Roman medals and Gallic axes.^q The traveller may form from the same place some notion of the wealth and industry of Limagne; he may see villages crowded on the sides of the mountains, hills covered with vineyards, vallies shaded by fruit trees, and in the distance, the fertile plain that extends from the banks of the Allier to the volcanic summits that command Clermont, Volvic and Riom. The heights above the plain are crowned in different directions with old and dark castles, while the plain itself is watered by numerous streams or by canals cut by the husbandmen, and is agreeably diversified with meadows, corn fields, orchards and plantations of poplar trees. Pont du Chateau^r contains about three thousand inhabitants; it is situated near the extremity of the plain on the banks of the Allier, which flows beneath a modern bridge, and falls the height of several feet from an artificial embankment.^s

Clermont is built on a height which cannot be said to be very lofty, if compared with the mountains that surround it. Ramparts adorned with fine trees form an enclosure round narrow and dismal streets.^t It may be

^t "Boulevards planted with fine trees form a regular enclosure round the town, which consists for the most part of narrow and gloomy streets."

urged, however, that the gloomy appearance of the town is owing, in part at least, to the lava with which the houses are built; the inhabitants cover them with a coat of plaster, but the lava always resumes its sombre colour. The cathedral was commenced in the twelfth century, but it remains still in an unfinished state; the architecture is bold and elegant; the greatest ornaments in the interior are the finely painted windows; the white marble figures on the outside contrast well with the dark lava of which it is constructed. The church of Notre-Dame du Port is without doubt a much more ancient building; lighted by arcades and not by ogives, and loaded with inscriptions in Roman characters, it was in all probability founded shortly after the introduction of Christianity in Gaul.

The principal squares (*places*) are very large, and some of them worthy of particular notice. That of Jaude forms a rectangle, not a square; a covered market is erected in the middle of it. A Gothic fountain ornamented with arabesques rises in the square of Champeix, a large but irregular quadrangle. That of the Poterne^a is bordered by an agreeable walk, from which the plains of Limagne, and the summit of the Puy de Dome may be distinctly seen. A fountain in the form of an obelisk has been erected to the memory of Desaix, at the extremity of that of Taureau. The ancient college, a very elegant building, is situated at no great distance from the last monument; large halls are set apart for public schools of drawing, mineralogy and natural history; it contains besides a valuable collection of casts from the finest ancient statues, and of different articles in the three natural kingdoms, among others, the best mineralogical specimens of the department. Other apartments are reserved for the academical society and for a library of twenty thousand volumes.^b A white marble statue of Pascal, certainly the most illustrious man that Clermont has produced, has been placed in the library. A large and valuable botanical garden is connected with the college.^c

The fountain of St. Allyre, in one of the suburbs of Clermont, is considered by the inhabitants the greatest wonder in the place, and guides are ever ready to show it to strangers. It is a ferruginous spring, abundantly impregnated with carbonate of lime; it supplies baths, the use of which medical men consider beneficial in some complaints. The transparency of the water does not indicate the ingredients that compose it, for in that respect it may vie with the purest crystal. Diverted into small buildings, where it is made to fall in minute particles^d on different objects, such as flowers, fruits, branches of trees, and stuffed animals of the largest or smallest size, it covers them with so fine a cal-

careous sediment as to give them the appearance of petrifications without changing their forms. These articles are collected^e and sold to strangers, many of whom, while observing the manner in which the calcareous molecules are disengaged from the waters, erroneously believe that they can discover in this mechanical operation, the phenomena of petrification. The spring of St. Allyre has made for itself a calcareous embankment that terminates in an irregular arch, under which flows a small rivulet.^f The natural bridge and embankment are formed by the sediment which the waters deposited around the plants that grew in their course. The calcareous sediment thus deposited extends over a space about two hundred and thirty feet in length, a branch of the same spring forms at present other works of the same kind,^g and as the length gained every year does not exceed four inches, it follows that a period of seven hundred years must have elapsed before the bridge and embankment which are now seen, were completed.

Clermont is not a manufacturing town; it possesses but few manufactories or works of any kind.^h It may be considered however an important depot for the neighbouring departments, and even for Bordeaux, Lyons and Paris. The people in Auvergne believe it to be a town of great antiquity; the ancient name of *Nemetum* renders their opinion not improbable, but if it existed at the time that Cæsar laid siege to *Gergovia*, it must have been a place of little importance, for it is not mentioned by the Roman general. It cannot be denied that it was enlarged and embellished by Augustus; indeed to perpetuate the recollection of the emperor's munificence, it was called *Augusto-Nemetum*.ⁱ It retained its senate and magistrates until the seventh century; the present name of the town appears to have been derived from that of an ancient castle on a neighbouring height; it is certain at least that both the one and the other were called *Clarus Mons*.^k

The Puy de Crouelle, Mount Rognon and various other mountains, the product of volcanic fires, seem like so many low hills from the lofty ramparts^l of Clermont, but they appear very different from the plain below the town; the first rises to the height of more than three hundred feet above the highest part of the town; the inclination of the alternate calcareous and basaltic strata towards its centre, may be considered the traces of the subterranean shocks by which it was raised.^m The basaltic cone on the second has been ascertained to be at least eight hundred feet above its base, and, like many other heights in the same country, it is crowned with the ruins of an ancient building.ⁿ Mont-Ferrand has been called a suburb of Clermont, although it is about a mile and a half distant

^h "Its manufactories and its tanneries are of little importance; it is however noted for its preserves (*pâtes de fruits*)."—The principal manufactures of Clermont are fine rascens, coarse serges, druggets, linen cloth, ribbands, silk stockings, candles and paper. Its preserved apricots have long been celebrated. (Ed. Encyc.)—It carries on a

from the walls;^a it consists of dark Gothic houses, that are crowded on an inclined plain. A country different from that which has been last described, extends in an opposite direction.

The oldest building in the burgh of Chamailere^b is a church that was built in the fourth century;^c there are besides six paper mills that are put in motion by the Fontanat, which waters a romantic valley. Old walnut trees display their thick foliage, while the broad-leaved ivy clings round their trunks; vines appear suspended above a road that follows the windings of a limpid stream; granite mountains support two immense currents of lava and masses of scoræ; and excavations similar to those at Pozzuoli exhale carbonic acid. A thermal spring whose waters are acidulated and ferruginous, was perhaps not unknown to Cæsar, at all events it bears his name;^d in the grotto of Royat, another spring issues from volcanic rocks by seven outlets, and forms as many cascades; in short the whole valley may remind an Italian of the finest sites in his country. The Puy-Chateix, so called from a castle which was built by the dauphins of Auvergne, rises above the village and grotto of Royat. The mineralogist may find near its summit, in the veins that run through the granite, beautiful specimens of sulphate of barytes; the botanist may discover several rare plants and lichens of the finest colours. Those who have neglected the previous study requisite for the enjoyment of scientific researches, may accept the invitation of the villagers, who are ready to show strangers the *Granaries of Cæsar*. It is thus that they call a ruin on the side of the mountain, where travellers have seen rye, wheat and other grain slightly carbonized,^e in all probability the effect of a fire by which the granaries of the ancient castle were destroyed.

An author of some celebrity^f affirms that the Puy de Dome is not a mountain; but what other name can be given to an eminence which commands all the volcanic summits in the neighbourhood of Clermont, and of which the absolute elevation is not less than 4500 feet, and the height above the base 2200. It is by no means unlikely that the writers who describe the crater of the Puy de Dome, have never ascended it.^g This mountain, which may be regarded as an ancient monument of subterranean convulsions, was probably raised from the depths of the earth through a crater, the orifice of which it has covered with its own mass. The ancients called it *Podium Dumense*; it is composed of a spongy rock through which are disseminated ferruginous laminæ of dazzling lustre.^h The same rock is of igneous origin, and known by the name of *domite*, the type of other analogous substances.

^a Montferrand, at the distance of a quarter of a league from Clermont (half a league, M. B.,) forms with it a single municipality, by the name of Clermont-Ferrand. Encyc. Meth. 1784.—P.

^c "The small town (*bourg*) of Chamailere contains a church built in the fourth century."

^d "known to Cæsar, whose name it still bears."

^e "It is thus that they call an *eboulement* (mass of debris or shingle) which covers the side of the mountain, and in which may be found grains of rye and wheat, slightly carbonized."

^f M. Blanqui, in his Account of a Journey to the South of France (*Relation d'un voyage au midi de la France.*) He makes the absolute elevation equal to 5000 feet.

^g Besides the work last mentioned, see also that entitled: *L'Ermite en province*, tome viii. p. 323.

^h Laminæ of specular iron (Daubeny).—Domite is a trachytic rock consisting of an aggregation of imperfect microscopic crystals of glassy felspar, with several other minerals imbedded, among which are specular and titaniferous iron in dispersed grains, blade-shaped laminæ or

Long and thick grass extends from the base to the summit, where a small excavation, the only remains of an ancient hermitage and chapel, has been dignified with the name of a crater, although it is deemed inaccurate to call the Puy de Dome a mountain. The view from the summit loses in richness what it gains in extent; no near or well-defined objects form a shade to a succession of airy distances; the sixty volcanos that form a long line from its base, might almost be compared to so many mole-hills in a field. The Puy de Nadailhat, which rises to the height of two thousand feet above the plain, has vomited from its sides an immense mass of lava, called the Serre, occupying on a considerable breadth, an extent of nearly three leagues. The Puy de Pariou, which rises near the base of the Puy de Dome, is remarkable for a regular and well preserved crater, about 960 feet in diameter and 280 in depth; the mountain itself is not less than five hundred feet higher than the last; still both of them appear very insignificant from the Puy de Dome.

The white summits of the Great Sarcouy and the Puy Chopine on the north of the mountains last mentioned, indicate a different origin from that of the neighbouring heights. In the first, the same porous substance may be discovered, as that which composes the Puy de Dome, and the name of the mountain still serves to indicate the use to which the rock was applied by the ancients; several unfinished *sarcophagi* have been found in the caverns dug by the Romans; it is certain they were considered valuable by the same people from the property they possessed of drying speedily dead bodies by absorbing the humid particles. The second attests the convulsions by which the neighbouring conical masses were raised, masses composed of different sorts of domites, granite and basaltic rocks.ⁱ The district^k of Riom extends to the north of these mountains; Pont-Gibaud,^l one of the places in the district,^k has been called a town, although the population does not exceed eight hundred individuals; it possesses a fine fountain, mineral springs, several corn mills and hydraulic saws; the inhabitants have lately begun to work argentiferous lead mines in the neighbourhood.^m

Low woods cover the base of the Puy de Nugere, and in many places thorns and nut trees conceal the vegetable mould formed by the decomposition of scoræ; the same Puy has vomitedⁿ from its inclined crater two currents of lava, which extend in different directions to the distance of 3600 yards, and meet below Volvic. The inhabitants of the burgh had long used these volcanic materials for building and other purposes; but the same sort of industry was not long since much extended by the ingenious M.

Chabrol. A school of drawing and sculpture was founded, casts of ancient figures were collected, the method of mutual instruction was introduced, and village lads soon became draughtsmen and sculptors. Different machines^a moved by water were also erected, and three times the number of hands were employed in extracting the lava. A ready market was found for the different products in Paris, and the lava, which had been before only used in building houses or in paving streets, is now changed by means of the lathe into columns, and by the chisel into elegant capitals; it serves also to multiply the master-works of antiquity, and is converted into *cippi* and funeral monuments; its sombre colour, its solidity, and its texture not affected by the atmosphere, render it more valuable for the last purpose than marble or even granite. It would not be easy to calculate the advantages that might accrue to the department, from the trade in these articles of luxury and utility, if canals made to communicate with the rivers that descend towards the capital, gave greater facility to their conveyance, for in the present state of communication, they are quadrupled in price by the mere expense of transport.

The importance of Riom may be attributed to its courts of law, and to the litigious propensities of the people in Auvergne; at all events, industry is at a low ebb, and the trade of the place is almost confined to articles of primary necessity. The town, which is well enough built, and watered by several fountains, stands on a hill above the Ambene; it is separated from its suburbs by ramparts and fortifications.^b It might be attended with advantage to the department if the courts of justice were transferred to Clermont.^c The tribunal, the *holy chapel* and the prison,^d the latter a large and well-aired edifice, are the finest buildings. Riom has produced several distinguished men, but none more so than Gregory of Tours. Although there is only one long and broad street in Aigue-Perse,^e the population amounts to five thousand inhabitants; the neighbouring country abounds in picturesque scenery, and that circumstance together with its mineral springs may account for it being a place of resort in the fine season. Two celebrated men, the chancellor De L'Hopital and the poet Delille, were born in the town.

The impulse that a canal and good roads might give to the commerce and consequently to the wealth of the department, may be estimated, in some degree at least, by the industry observable along the course of the Dore and the Allier, and on the road lately opened to Lyons, in the district^f of Thiers. The town of the same name, enclosed on all sides by a wild and romantic country, consists of

^a A turning-mill (*tour*.)

^f "Arrondissement."

^g "It has carried on the manufacture of coarse cutlery for three hundred years."

^h "The manufacture of paper dates from a period almost equally re-

singularly painted but not inelegant houses. The inhabitants have carried on a trade in hardware and coarse cutlery during three hundred years,^g and the same sort of industry furnishes employment at present to more than twenty thousand persons in the town and neighbouring hamlets. The paper made in the same place dates from a period almost as remote, but in consequence of the improvements that have been successively introduced, the quantity now manufactured is much greater, and the quality much finer.^h Ten or twelve other works are in an equally prosperous state,ⁱ and it may be added that the Durole, the great mover of all its manufacturing establishments, is only a small stream that rushes through a narrow ravine. The village^k of St. Remy participates with Thiers in the same kind of industry; it carries on a trade in cutlery and hardware goods,^l and contains nearly four thousand inhabitants. The fir trees cut on the neighbouring heights,^m are divided into planks by means of hydraulic saws, at the burgh of Puy-Guillaume on the banks of the Dore. Maringues rises on the Morge, not far from the Allier; many of the inhabitants are employed in dressing chamois and kid skins.ⁿ Courpierre,^o the chief town in an agricultural district,^p contains about three thousand individuals; one or two mills have been built in it for the purpose of grinding bones,^q which are afterwards used as a manure.

The district^r of Ambert, although not so favourably situated as the last, is still very important on account of its industry. The best cheeses in Auvergne are exported from the town, which gives name to the district;^s the stream which traverses it, and which throws itself into the Dore, puts in motion more than sixty paper mills and different works.^t Arlanc^u is situated above Ambert in a pleasant valley on the banks of the Dolore; the principal manufactures are lace and ribbons; Marsac and Viverols carry on a trade in articles of the same sort.^v Mines of argentiferous lead are worked with profit in the neighbourhood of St. Amans-Roche-Savine:^w lastly, the burghs of Oliergues and Cunlhat^y export the same products^z as Ambert.

All those who have visited the department, agree that its commerce and resources might be greatly increased; to judge from the antimony, lead and coal mines, considerable wealth might be extracted from the depths of the earth. The fruitful soil of Limagne might be covered with the richest harvests, if the prejudices of the peasantry were not opposed to every improvement. The rich meadows of Mont-Dor, and the fine pastures that cover all the sides of the volcanic Puys, are admirably adapted for rearing cattle; but at present the breeds are of an inferior kind, and require to be improved by introducing oxen from

mote, and the numerous improvements which have been introduced, have served to maintain its reputation."

Switzerland, and sheep from Spain. The wretched condition of the people in the rural districts may be readily inferred from the following remarks. A peasant, encumbered with unwieldy wooden shoes, may be seen holding a long goad in his right hand, and driving oxen attached to a wooden cart, of which the wheels without iron make the air resound with the shrill and disagreeable noise produced by the friction on the axle-tree. The ancient *araire*, a very clumsy plough,^a is still used in the fields; the ploughman stops his oxen by repeating the Latin words, *sta bos*, words introduced by Roman masters, from whom they have been handed down to men ignorant of their meaning. The cottages of the peasantry proclaim their poverty; the windows do not admit sufficient light, and the doors, and even the walls, hardly afford shelter against the blast. The labourer is seen in his wretched dwelling, borne down by want and toil; his principal food is cheese or milk, which

cannot be of a very good quality, for the cows are ill-fed, and they are used in common with oxen in the plough. But the people are laborious and worthy of a better fate; the country-women, who carry on their heads the provisions which they sell in the towns, are generally employed in knitting stockings, or in turning the spindle, as they go to market. It is not uncommon for the peasants in their leisure hours to carry saekfuls of earth to places difficult of access, and which the kindness of the proprietor allows them to cultivate.^b They are degraded by the prejudices which prevailed throughout France about three centuries ago, and by ignorance, not of their duties, for they are honest and upright, but of whatever regards their comfort and welfare; it may be truly said that more knowledge and less superstition might enable them to enjoy the blessings, of which their laborious perseverance renders them not unworthy.

^a "A plough without wheels."

^b "The peasants carry earth in baskets to almost inaccessible places, and thus render them proper for cultivation."

BOOK CXLV.

EUROPE.

Europe continued.—France.—Fourth Section.—Eastern Region.

LYONNAIS, Burgundy, Franche-Comté and Alsace make up the eastern region. The inhabitants are more enlightened and more wealthy than those in the central departments; the relative population is also greater. The superficial extent is equal to 2960 square leagues, and the number of individuals to 4,192,000; consequently the mean number in every square league is equal to 1416.^a The mountains of Forez separate the two regions; in the one the people are comparatively ignorant, poor and wretched; in the other they are well informed, industrious and happy: how happens it that such differences exist in a country, of which all the inhabitants enjoy the same rights and privileges, and are governed by the same laws? They may be accounted for by many concurring causes, but the facility of communications is perhaps the most effectual of any. The region we are about to enter is better provided with roads, navigable rivers and canals^b than any other that has been yet described, and it possesses no other advantage which exerts a greater influence on the industry of the inhabitants, or contributes more to improvements of every kind.

The department of the Loire is traversed from the southern to the northern extremity by the river of the same name, which flows between two chains of mountains, consisting partly of granite and partly of sandstone and limestone,^c and which waters a country of little fertility, as the insufficiency of its harvests attests; the department however contains valuable mines of iron and lead, and the rich-

^a 1416.216 nearly.—P.

^b "Roads (*routes*) of different classes, common highways (*chemins communaux*, roads passing from one *commune* to another or for the use of a particular *commune*.)* several considerable secondary rivers (*rivieres*—navigable branches,) two large primary rivers (*fleuves*—the Rhone and the Rhine,) and many canals!"

* In 1809, the roads of France were classed as follows: viz. 1. great roads (*grandes routes*) passing from one frontier of the empire to another through Paris; 2. roads (*routes*) passing from one frontier to another, but not through Paris; 3. roads (*routes*) connecting the different towns (*villes*) of the same province or of neighbouring provinces (—the regulation was founded on an edict of Feb. 6, 1776, whence the term province is here used;) and 4. private roads (*chemins particuliers*, corresponding to *chemins communaux* in the original text, and to our cross roads or common highways,) connecting small towns or villages (*petites villes*—*bourgs*.) Code Administratif. Part. Police. Tom. II. p. 432.—P.

† The principal canals in eastern France are, 1. the Canal of Forez, intended to open a communication between the Rhone and the Loire (—completed 8 miles from Givors on the Rhone below Lyons to Rive de Gier. Ed. Encyc.) ; 2. the Canal of the Centre, from Digoin on the Loire to Chalons on the Saone (—completed, length 71 miles. Ed. Encyc.) ; 3. the Canal of Burgundy, intended to connect the Seine and the Saone (—the line extends 148 miles from Brinon on the Armançon, a branch of the Yonne, by Dijon to St. Jean de Losne on the Saone—navigable (1814) from the Saone 13 leagues to Pont de Parry 5 leagues west of Dijon, and from Brinon to the vicinity of Ancy le France—the summit not completed. Ed. Encyc.) ; 4. the Canal of Monsieur, intended to connect the Doubs and the Rhine (Alman. Royal, 1822.)—P.

est coal mines in France. Metals rendered subservient to many domestic purposes, flax and hemp woven to satisfy the luxury of the rich, or the wants of the poor, silk made to assume a thousand different tints, and converted into articles^d which the caprice of fashion multiplies almost to infinity, yield greater profits to the inhabitants than any that could be derived from the culture of the richest soil.

Of the three districts^e into which the department of the Loire is divided, that of St. Etienne is the most industrious and the most populous. The people in the small town of Bourg-Argental rear many silk worms; they are also employed in manufacturing crapes and different stuffs.^f The inhabitants of Chambon^g work their coal mines, manufacture ribbons, and export a great many nails, knives, and files;^h Firminy carries on a trade in the same articles.ⁱ A fine walk leads to St. Chamond,^k a town of six thousand inhabitants, where public baths have been lately erected.^l The waters of the Ban and the Gier^m serve to move different works and not fewer than thirty ribbon manufactories.ⁿ Rive de Gier^m contains not less than eight thousand inhabitants; the wealth of the town may be attributed to its glass and iron works, and to its mines of excellent coal, worked by means of forty steam engines; it is situated near the junction of three vallies on the small river Gier, and at the commencement of the canal of Givors. The village of Berardiere in the neighbourhood of the chief town, may be mentioned on account of its steel founderies.

The immense progress that industry has already made in France, renders it difficult to assign any limits to future

ⁿ "—are employed in carrying on the same manufactures as those last mentioned. The town contains more than thirty manufactories of ribbons and cords (*lacets*.)"

^o An iron work constructed after the English method (*forge a l'Anglaise*), in the suburb of St. Julien, furnishes annually more than six million lbs. of iron. M. B.—St. Julien en Jarrets, a small town (*bourg*) one league N. of St. Chamond. (Vosgien.)—P.

* The English generally use coke in reducing iron, instead of charcoal which is more commonly used on the continent. Consequently, their furnaces are constructed so as to furnish a more powerful blast and to sustain a more intense heat. As the iron work above mentioned is situated in the heart of one of the greatest coal districts in France, it was undoubtedly constructed for using coke.—P.

improvements, but from what has been already done, it is reasonable to suppose that much more may be accomplished. A rail-way, now almost finished, extends from St. Etienne to Lyons, so that goods may soon be conveyed from the one place to the other in half the time that is at present necessary. The distance may be equal to twenty-five or twenty-six miles;^a the work was commenced near the close of the year 1827, and what has been already accomplished, has entirely changed the appearance of the country. Hills and vallies have been levelled, 620,000 cubic yards^b of the hardest rock have been torn from the soil, 120,000 cubic yards^c of earth have been taken away, and in order to fill up the inequalities in the ground, 110,000 have been removed from one place to another;^d on the whole line, not fewer than a hundred and twelve arches, each of them forming a bridge, have been raised, and it has been necessary to cut through a high hill in the neighbourhood of St. Etienne.^e It is calculated that at no distant period steam-engines travelling at the rate of five miles an hour, and dragging each fifteen loaded waggons,^f may be substituted for the eighteen hundred vehicles that pass daily between the two towns.

St. Etienne, says a good judge of such places,^g is built without regularity; there as well as in many commercial towns, order and beauty are of secondary importance. Workshops covered with tiles, darkened with smoke and without windows, resembling the abodes of the Cyclops, surround the elegant and modern town-house, which the inhabitants have erected on the Place Neuve.^h The streets are filled with a dark and light dust, which covers clothes, houses and even furniture. It is, however, in these very streets that the people manufacture the light gauze, the laceⁱ and the dazzling ribbons, for which the whole of Europe is tributary to France. Contiguous houses are inhabited by armourers and embroiderers; the movement of the loom is heard in the streets, and the noise of the anvil resounds in the fields. "I have seen," continues M. Blanqui, "men on horseback, who to judge from their squalid dress, might be thought unable to afford linen, but I afterwards discovered that they were the proprietors of productive iron works. Miners without shirts refuse to take charity, while beggars with shirt-ruffles walk the streets of Paris. The houses, which not long since formed part of the suburbs, are now in the heart of the town, and the number of inhabitants has increased within a period of less than ten years from twenty to forty thousand. What a contrast to Montbrison, the capital of the department, which is inhabited principally by the wealthy and the idle; there the population decreases incessantly, and all the mendicants in Forez resort to it!"

St. Etienne contains a royal armoury, forty in which arms of every sort are made, fifty-five places in which

^d "900,000 cubic metres have been employed in filling up the inequalities in the surface."

^e "On the whole line, 112 bridges (*ponceaux*) have been constructed, and a tunnel has been opened through a hill (*montagne*) near St. Etienne."

^f "Steam-carriages, each consuming 70 kilogrammes of coal and 350 kilogrammes of water per hour, travelling two leagues in 60 minutes, and drawing fifteen waggons carrying altogether a weight of 1,200,000 lbs.—"

^g M. Ad. Blanqui, Relation d'un voyage au midi de la France, pendant les mois d'Août et de Septembre, 1828.

hard-wares and cutlery are wrought, a hundred and fifty ribbon and velvet manufactories.^k Montbrison might rival it both in trade and in manufactures, for the Vizezy^l which flows through the town, furnishes enough of water to move the most important works. But the inhabitants do not devote themselves to any branch of industry, and the town is ill-peopled and ill-built. The only edifice to which any additions have lately been made, is the royal college; it is unnecessary to add that these additions were made by government.^m Many suppose that the present town was founded in the twelfth century by Brison, whence it received the Latin name of *Mons Brisonis*. The mineral waters are held in great reputation, and several remains of antiquity prove that they were not unknown to the Romans. It was from the summit of the volcanic rock which commands Montbrison, that the sanguinary baron of Adretsⁿ precipitated the catholics whom he had taken prisoners during the civil wars. The small town of St. Galmier carries on a trade in wax-lights for the use of churches;^o it stands on an eminence not far from the Croize. A mineral spring rises from a rock near the town, and the waters that issue from it, have a strong vinous flavour. Feurs is situated on the road between Thiers and Lyons; it is the *Forum Segusianorum*, the ancient capital of the *Segusiani*, of which the name was afterwards extended to the province of Forez.

The Gand flows below the small town of St. Symphorien de Lay, a place of some importance from its trade and manufactures. It is situated in the district^p of which Roanne is the capital; the latter, occupying the site of an ancient town which Ptolemy calls *Rodumna*, was considered a mere village about the commencement of the eighteenth century, but the industry of the inhabitants has since restored it to something like its former rank; it is at present well built, and the population amounts to more than eight thousand individuals. Some remains of Roman monuments have resisted the vicissitudes of time and barbarism.

If there is any department in France, which may be said to prove the superiority of manufacturing over agricultural industry, it is certainly the department of the Rhone. The soil, intersected by hills and vallies, is not very fruitful; it does not yield one half of the grain or timber necessary for the consumption. But if the harvests are scanty, the vineyards are productive, and the wines of an excellent quality; the best are those of Cote Rotie and Condrieux. Artificial meadows afford pasture to many herds of oxen, and to numerous flocks of sheep and goats. It would be incorrect therefore to ascribe the deficiency in corn to the negligence of the husbandman; on the contrary, he appears to derive from the fields all the profit that can be obtained from them. The flourishing state of the country

^h New Square.

ⁱ "Tulle"—a kind of thin silk lacc.

^k "—a royal manufactory of fire-arms, 40 manufactories of arms of every kind, 10 of cutlery, 45 of hardware (*quincaillerie*.) and 150 of ribbons and velvet." ^l Vezize, Vecize.

^m "The only edifice to which any recent additions have been made, is that of the college." The original does not call it a royal college, nor does it say that the additions were made by government. No royal college at Montbrison is mentioned in the Alman. Royal, 1822. Montbrison had before the revolution, a college belonging to the priests of the Oratory.—P.

must be attributed to its manufactories; if the department of North be excepted, there is no other in France, which contains so great a population relatively to the surface, for the mean number of inhabitants on every square league is equal to two thousand nine hundred and fifty-four. Copper and coal, the most valuable of its productions, furnish the materials with which the numerous founderies are supplied.

The population of Tarare does not exceed seven thousand inhabitants; it contains, however, not fewer than sixty-five muslin manufactories, and twenty-five of embroidered work; the latter are the first of the kind that were established in France; they afford employment at present to more than fifty thousand workmen, who are scattered in different districts. The town stands at the foot of a hill which bears its name, and on the left bank of the Tardine, a small river that sometimes inundates the neighbouring fields, but the devastations thus occasioned, are amply redeemed by the advantages the manufacturer derives from it. Thizy and Amplepuis rival each other in their cotton manufactures. The village of Tours carries on a trade in the mixed stuffs, with which it supplies different departments; they are made of linen and cotton, and known in France by the name of *beaujolaises*.^a Beaujeu, a small but well-built town, is finely situated on the Ardiere; it stands at the base of a hill, on which rise the ruins of the strong castle that belonged to the lords of Beaujeu. It possesses several paper mills, and carries on no inconsiderable trade in wine. The same trade and the sale of embroidered works tend to enrich Belleville sur Saone. The two last towns contain nearly an equal number of inhabitants; the population of each amounts at least to three thousand individuals. Ville-Franche,^b the capital of the wealthy district in which they are situated,^c consists of a broad street about a mile and a half in length, and of houses grouped round it, which form the suburbs. The lands watered by the Saone and the Morgon are very fruitful; the neighbouring hills are covered with vineyards. It must be admitted, however, that the picturesque scenery round Ville-Franche has not been much improved by cultivation;^d as a manufacturing town, it is a place of considerable importance. The village of Chessy near the left bank of the Arbresle, is about three leagues on the south of it; it contains six hundred inhabitants, and is well known on account of its copper mines, the most productive in France.

Lyons is remarkable for the beauty of its situation, and for the magnificent view presented by the country houses in its neighbourhood, by its four suburbs,^e and by the twenty quays on the Saone and the Rhone. The gentle current of the first river and the rapidity of the second form a striking contrast. The Saone offers an emblem of peace—favourable to the arts, to commerce and to industry; boats

are continually passing up and down its stream, and seventeen harbours^f are situated on its banks. The Rhone, emblematic of war and civil discord, is an impetuous torrent which the temerity of man does not always brave with impunity; the loud noise of its waters is the only sound that can be heard on its dismal and deserted banks. Other and less pleasing contrasts may be observed in the same town; in its fifty-six squares, mean and sorry buildings rise by the side of the most sumptuous edifices; its two hundred and forty-five streets are ill-paved, narrow and dirty, and as rain is of frequent occurrence, they are very often wet. All the inhabitants must be equally indifferent about the cleanliness of their town, otherwise the same filth could not be seen near mean shops and costly warehouses, the humble abode of the artisan, and the habitation of the wealthy merchant. The *canuts* or silk weavers prepare in their smoky garrets light crapes, brilliant satins and pliable taffetas of the richest colours; no sooner have they been taken from their dirty hands, than they are sent to Paris, where they assume the various shapes that fashion renders indispensable.

Lyons or the ancient *Lugdunum* was one of the principal cities in the dominions of the *Segusiani* at the time that Cæsar took it from the Gauls. About forty years before the vulgar era Munatius Plancus received instructions from the Roman senate to allow the people of Vienne, who had been driven from their town by the *Allobroges*, to settle in *Lugdunum*. It became not long afterwards one of the most flourishing Roman colonies in France; Strabo says that it was only inferior in population to Narbonne. The importance and the admirable position of the town rendered it frequently the residence of the governors of Gaul.^g It was first built on the declivity of a hill, which rises on the right bank of the Saone; it was embellished by many noble monuments, but they were all destroyed by fire in a single night.^h This disastrous event, of which history affords fortunately but few examples, happened in the year 59 of the Christian era, during the reign of Nero, by whom it was rebuilt. It does not require a minute examination of ancient edifices to be convinced that the Romans knew well how to avail themselves of the inequalities in the surface, and thus to give their towns an air of majesty, which we look for in vain in modern cities. The palace of the emperors rose on the hill of St. Just, where the monastery of Antiquaille,ⁱ now changed into an hospital for *Incurables*, was afterwards built. The name of the convent appears to have been derived from the number of medals and other antiquities, which were discovered in digging the foundation. An amphitheatre was erected on the same height, and some remains of it are still seen in the gardens round the convent of the Minims. The waters of the Rhone and the small river Furaut were conveyed by means of an aqueduct at least two leagues in length, to different parts of the town.^k Sixty Gallic nations

^a "Thizy and D'Amplepuis are employed in the manufacture of calicoes, and of the cotton stuffs (*cotonnades*) called *garets*, as well as in the spinning of cotton; the mixed cloths of linen and cotton called *beaujolaises*, are made in the village of Cours."

ⁱ "L'Antiquaille."—The hospital, called the Antiquaille, is situated on the declivity of Fourviere. Ed. Eneye.—P.

^k Ancient Lyons was supplied with water by four aqueducts, two of which are confounded in the text. The great aqueduct, some remains of which may be seen near the gate of St. Irène and in other parts of its course, extended for seven leagues, from the stream called Furens, near the town of St. Etienne, to the gates of Lyons. A second aqueduct, some remains of which appear in the valley of Eully, conducted the waters of Mont D'Or to the hill of Lyons (Fourviere). A subterranean aqueduct conveyed the waters of the Coise and the

raised at the confluence of the Saone and the Rhone an altar to Augustus, of which the four principal columns have been removed to the altar in the church of St. Martin d'Ainay. But the two rivers meet no longer at the same place; more than fifty years have elapsed since Perrache the sculptor thought it practicable to divert the course of the Saone,^a which now falls into the Rhone below its former confluence; the ancient channel was thus drained, and it now forms a public walk.^b The four Roman roads traced by Agrippa passed through Lyons, one of which extended through Auvergne and Aquitaine to the Pyrenees, another to the Rhine, a third through Picardy to the Ocean, and a fourth through Narbonnese Gaul to the Mediterranean. A rock that was cut by order of Agrippa, still bears the name of *Pierre-Scise*; Buchard of Burgundy built on it in the eleventh century, a formidable castle, which was in later times changed into a state prison. The names of many other places in the town and neighbourhood of Lyons are connected with ancient associations. In the time of the Romans, *Bella Curia* was the name of the place, from which the prætor pronounced his decrees; it is at present the square of Bellecour.^c The elegant buildings which adorned it, were demolished by a furious conventionalist, but they were raised anew by Napoleon. It forms a regular oblong square, and the fronts of two very large edifices adorned with pilasters and surmounted by balustrades, terminate the two opposite extremities; it is bordered by rows of lime trees. The hill of Fourviere^d formed part of the original enclosure of the city; on it was situated the *Forum Vetus*, or according to some antiquaries, the *Forum Veneris*, that Trajan erected. The hill was called after the forum, and an ancient chapel on it was restored to the catholic worship by Pius the Seventh during his short residence in the town in 1805. The square of Terreaux^e may recal events of a different nature, events that have left an indelible stain on the page of history; there Cinq-Mars suffered death for having attempted a change in the administration of his country, or rather for having conspired with some others against the proud and vindictive minister of Louis the Thirteenth; there too the virtuous president De Thou was beheaded, because he chose to die rather than betray his friend.^f

Lyons is connected with many historical events. When after the death of Pertinax, Albinus and Severus contended for the empire, the town declared for the former, and opened its gates to him after his defeat; it was consequently levelled

Brevenne to St. Irenée; and a fourth aqueduct extended from Montluel along the Rhone and terminated in the hill of St. Sebastian. Ed. Encyc.—P.

^a "Conceived the project of turning the course of the principal river" (*le fleuve*, the Rhone—the Saone being only a tributary (*rivière*).—P.)

^b "A public walk (*promenade*) extends along the former channel." Before 1772, the Rhone and the Saone joined their waters near Ainay. The sculptor M. Perrache conceived the idea of removing their confluence to the village of Mulatiere, and in 1770, he obtained letters patent for the purpose. A company was formed, and a new bed was excavated for the Rhone, which was compelled to take another direction, by a magnificent causeway nearly a mile and three quarters long, planted with Italian poplars and forming a continuation of the quays of Lyons. Ed. Encyc.—The Rhone formed a kind of delta at its junction with the Saone. A canal formerly connected the two rivers at the Place Terreaux, now in the heart of the town, below which point there was formerly a group of islands, which have been artificially united by made ground, and are now covered with houses.—P.

^c *Place Belle Cour*. ^d *Fourvieres*.
^e *Place des Terreaux*—so called from its occupying the site of the canal which connected the two rivers (*terre*, land—*eau*, water).—P.

^f Not the president De Thou, but his eldest son Francis Aug. De Thou.—P.

^g It was pillaged and partly burnt by Severus in 193, in order to

with the ground by the victor;^g a hundred and fifty years elapsed before it rose from its ruins. It formed a part of the Burgundian kingdom during the fifth century. It was at one time subject to the kings of France, at another under the power of its archbishops, but it was taken from the latter by Guy, count of Forez.^h After many wars between the descendants of the count and the clergy, the latter recovered their authority; but the town was not therefore more fortunate, for the canons of Lyons assumed the title of counts, and the people had to submit to a double tyranny—the arrogance of the nobility, and the rapacity of the church. Louis the Gross by introducing the municipal system into his dominions, rendered the sword and mitre less oppressive. It might be shown indeed that the effects of the change were felt at Lyons before the town was added to the monarchy. But during a hundred years after the same period, the archbishops continued their depredations, and the people were frequently excited to revolt; at last St. Louis declared himself the arbiter of the scandalous exactions on the part of the church, and of the resistance which such proceedings rendered lawful on the part of the people; by the decision of the same prince, Lyons was included within the dominions of the crown. From that epoch the citizens had the right of electing their own magistrates, of controlling their receipts and expenses, and of providing for their own defence; personal liberty was also secured to them; no citizen could be cited in judgment beyond the walls of the town. It was at the general council held at Lyons in 1245, that the cardinals by an order of pope Innocent the Fourth, clothed themselves for the first time in scarlet.ⁱ This wealthy city was destroyed in 1793 by the revolutionary army after a siege of sixty-five days, because the inhabitants attempted to free themselves from popular tyranny. Two deputies of the convention at the head of sixty thousand men could not effect a capitulation until the town had been bombarded, and until the besieged had suffered all the horrors of famine. The principal edifices were demolished, and in conformity to a decree, the town was called *Ville Affranchie*. Cruel mockery, worthy of the period; the anarchists confounded freedom with the work of destruction!

The commercial prosperity of Lyons dates from the reign of Francis the First; the inhabitants learnt from the Genoese the art of manufacturing silk. The town contained about forty years ago 180,000 individuals, and there were

revenge himself on the inhabitants for having given shelter to Albinus, his enemy. In 202, he persecuted the Christians in Lyons with the greatest severity. Irenæus suffered in the persecution with 19,000 of his fellow Christians, the bones of which are said to be preserved in a vault in the church of St. Irenée.—P.

^h "By turns subject to the kings of France and its archbishops, it was taken from the latter by Guy, count of Forez." During the reign of Honorius, it was ceded by Stilicho to the Burgundians, who made it the capital of their kingdom. About the year 532 it came into the possession of the kings of France, who in 955 ceded it to Conrad, king of Burgundy beyond Jura (*Burgundia Transjurana*.) On the division of the kingdom of Burgundy after the death of Rodolph III., the archbishop of Lyons and the counts of Forez long disputed the possession of the city. The latter finally prevailed and retained it until 1173, when Guy II. and Guy III. ceded it to the archbishop Guichard and the chapter. Finally, the temporalities of the city were surrendered to Philip the Fair, who already possessed the sovereignty, by the archbishop Philip of Savoy, (A. D. 1307.) Moreri.—P.

ⁱ "It was at the general council held at Lyons in 1245, for the purpose of renewing the crusades,* that pope Innocent IV. for the first time invested the cardinals with the purple." Innocent IV. conferred the red hat on the cardinals, at the council of Lyons 1245, and Paul II. the red garment in 1464. Moreri.—P.

* The eighth crusade, conducted by St. Louis.

not fewer than 18,000 looms, which were annually supplied with 12,000 quintals of raw materials. In consequence of the acts of the convention, the population was greatly diminished, and in 1802 the number of looms was reduced to seven hundred. When France by colossal strides extended her frontiers from the Tiber to the Elbe, Lyons became again an important manufacturing town; still, however, the population is not so great as it once was, for with the suburbs of Vaise, La Croix Rousse and La Guillotiere, it amounts only to 172,000 persons; but it may be observed that the manufactures have become more extensive than they were even during the period when silks were generally worn. The number of looms at present is equal to nearly twenty thousand; manual labour has been abridged by improved machinery, and the products of each workman are greater. Thus, with a diminished population it manufactures more than it did forty years ago, and as the inhabitants consume much more, the revenue has increased in proportion; according to the last accounts, it is not less than 3,120,000 francs, or about L.130,000.

The Lyonese allow that their town is very dirty, but they insist that some of the edifices are very magnificent; as if fine buildings were in good keeping with filthy streets. The time in which the cathedral^a was founded, has not been ascertained; it may be admired for the imposing simplicity of the interior, and the richness of the portal. The palace of the archbishop was built in the reign of Louis the Thirteenth; in point of size it might serve as a residence for kings. Two fine edifices, namely, the Great Theatre, which reflects the highest credit on the architectural talent of the celebrated Soufflot, and the town-house, which, with a single exception, may be allowed to be the finest in Europe, are situated at no great distance from each other, in the quarter of St. Clair, the most fashionable part of Lyons. Within the chamber of commerce and the arts are the exchange together with the collections of paintings and antiquities,^b an union descriptive of the character of the people, who estimate the arts and sciences only inasmuch as they may be made subservient to trade and industry. The ancient convent of the Trinity has been changed into a royal college; it contains the most valuable provincial library in France, a library consisting of a hundred and six thousand volumes and eight hundred manuscripts in different languages.

In Lyons, as well as in other places, the desire of knowledge has increased of late years; it is to be hoped that it may become still more general, and that it may extend to every class of the community. The wealthy by diffusing the blessings of education, have it in their power to confer the greatest benefits on the poorer citizens, and to secure the prosperity of their town, for the concomitants of diffused knowledge are additional industry, improvements of every sort, public tranquillity and public happiness. There are at present five scientific societies in Lyons, namely, the royal academy of sciences, arts and belles lettres, the Linnæan

society, the society of agriculture and natural history, and those of medicine and pharmacy. Among the places of education, we may mention the school of rural economy and the veterinary art, that of arts and trades, and that of drawing;^c public lectures are besides delivered on natural history, chemistry, geometry and physics. A botanical garden and a royal nursery may be also enumerated among its useful establishments.

The beneficent institutions attest that in Lyons at least, philanthropy is not an empty sound, a word void of meaning. The infirmary^d is the best institution of the kind in France. Fourteen hundred children are admitted every year into an hospital, in which four times that number are educated and maintained.^e A religious house has been set apart for such as are afflicted with the loss of reason, and in another building the best means are provided for the instruction of the deaf and dumb;^f in addition to these places may be mentioned a savings-bank for the whole department, together with different friendly and benevolent societies.

The names of the distinguished men that have been born at Lyons from the earliest times to the present period, might form a long list. Germanicus, Claudius, Marcus Aurelius, Caracalla, Geta, the bishop Sidonius Apollinaris, Peter Valdo the reformer,^g Philibert Delorme the architect of the Tuilleries, Coustou and Coysevox the celebrated statuaries, Anthony de Jussieu the botanist, Morellet the political economist, Rozier, a writer on agriculture, Patrin the mineralogist, and Marshal Suchet, are the most remarkable persons whose names occur at present to our recollection.

The minute description which such a city as Lyons requires, may be apt to make us forget that there are other places in the neighbourhood. The people of St. Genis-Laval manufacture oil, different colours and banners; the pictures with which they supply several churches, may with equal accuracy be denominated *manufactures*.^h Arbresleⁱ is situated at the confluence of the Brevanne^k and the Tardine; the town was completely destroyed by inundations in 1715, but it was soon afterwards rebuilt; the inhabitants carry on a considerable trade in hemp.

The course of the Rhone on the east and the south, and that of the Saone on the west, form the limits of the department^l which the Ain traverses from north to south. The last river divides it into two regions: the western on the right consists of an undulating plain,^m in which the lands are argillaceous and in many places humid and marshy; the eastern on the left is covered with heights about 2,600 or 3000 feet in elevation,ⁿ which are attached to the Alps by the chain of Jura. The same country is watered by impetuous torrents, and intersected by deep vallies, almost all of which extend from north to south. In the first region, agriculture forms the principal occupation of the inhabitants, and the harvests are sufficient for the consumption; the only mineral productions are peat and coal. The people in the second cultivate fruitful vallies, rear a great number of sheep

and horses,^a and work iron mines and different quarries, the last of which afford excellent materials for building, and the best lithographic stones in France.

Few towns of any importance are situated in the department. Trevous, built like an amphitheatre on the left bank of the Saone, is the capital of a district,^b in which the principal places are Montluel, a town of three thousand eight hundred inhabitants, many of whom are employed in manufacturing cloth, and Thoissy,^c the birthplace of the celebrated anatomist Bichat. The small but neat town of Pont de Vaux on the banks of the Ressouse, communicates with the Saone by means of a canal; the inhabitants have erected a fountain in the form of a pyramid to the memory of General Joubert, their townsman. Bourg en Bresse, so called from the name of the ancient province of which it was the capital, is at present the chief town in the department. It rises on the site of *Tannus*, which was founded about the end of the fourth century;^d it is well built, watered by fountains, and embellished with agreeable walks on the Ressouse and the Veyle;^e its commerce might be greatly improved if it were within reach of navigable rivers. It has given birth to two distinguished men, namely, Vaugelas the grammarian, and the astronomer Lalande.

The territory between the Rhone and the Ain, constituting the districts^f of Belley and Nantua, was formerly called Bugey, a country connected with ancient recollections, and abounding in picturesque sites. Polybius was of opinion that this small region might be termed the Celtic Delta, a name to which it is still entitled from its triangular form. Belley,^g the capital, existed at the time that Brennus undertook his expedition against Rome, and was destroyed by the people, who fled at the approach of the fierce Gaul; it did not become again a place of importance until after the country was conquered by the Romans. The ancient names of Belley were *Bellitium*, *Bellicum* and *Bellica*.^h Alaric burnt it in the year 390; twenty years afterwards it was rebuilt and enlarged by his nephew Wibert.ⁱ It was destroyed a second time by fire in 1385; but Amadæus the Seventh, count of Savoy, again rebuilt it and encompassed it with walls. The small village of Frebuge near Nantua, is the *Forum Sebusianum*, once the principal city of the *Sebusiani*, which has been erroneously confounded by some authors with Bourg en Bresse. Nantua derives its name from the *Nantuates*; it is situated in a narrow valley bounded by steep rocks, near a small lake shaded with trees; the banks of the latter form an agreeable walk, and the waters abound in excellent trout; the inhabitants manufacture linen and paper.^k Oyonnax,^l a burgh at no great distance from Nantua, contains fifteen hundred inhabitants; they carry on a

trade in the same kind of goods.^m An author who has favoured the world with his etymological researches on Bugey,ⁿ maintains that Oyonnax was founded by the Rhodians three centuries before the vulgar era. The people who inhabited the country of Gex, having encouraged the invasion of Gaul by their neighbours the Helvetii, Cæsar, after he had subdued the invaders, united the territory of Gex to that of the *Sebusiani*. The town of Gex is ill built and difficult of access; a terrace that rises above the principal street commands an admirable view of the lake of Geneva, and of the mountains of Savoy grouped round the majestic Mont-Blanc. From the same terrace may be seen Fernex or Ferney in an agreeable valley; it was only a hamlet of fifty inhabitants when Voltaire made it the place of his residence, but that great man introduced there a new branch of industry, and at the time of his death, Ferney contained more than eight hundred watchmakers; their number at present does not exceed a thousand.^o

The department of the Saone and Loire is separated from the last department by the Saone. Fruitful in corn and wine, and in other agricultural products, abounding in coal, lead, iron and manganese, intersected by roads, canals and navigable rivers, and peopled by industrious inhabitants, it may be reckoned among the wealthiest departments in France. Macon,^p the capital, is situated on the right bank of the Saone, and on the frontier of the department. The position may be favourable for the trade in wine, but a worse one could not be selected for the seat of the principal authorities. The town was called *Matisco* by Cæsar, who strengthened it with fortifications, and rendered it a depot for military supplies.^q Several ancient ruins are contained in it, and an old bridge which still remains, is supposed to have been erected by the Roman general. The houses are by no means elegant, and the streets are narrow and ill paved, but the quays are broad and well built. The sanguinary St. Point, who flourished in the sixteenth century, and rendered himself infamous during the religious wars by the atrocities that were then termed the *Sauteries of Macon*, was a native of the town.^r The fine cathedral was destroyed by the revolutionists, but they spared the former episcopal palace.^s The village of Romanèche contains two thousand inhabitants, and the country in the neighbourhood is famous for its wines.^t Cluny,^u a town of four thousand souls, and a place of considerable trade,^x was formerly celebrated on account of a magnificent abbey belonging to the Benedictines. The convent has been changed into a college, and it contains besides other useful institutions.^y The town was the birthplace of Prudhon the painter. Greuze, not less celebrated as a painter, was born at Tournus; the mon-

ument which has been raised to his memory, is certainly the greatest, perhaps the only ornament that can be found in the town.^a The population amounts to five thousand individuals; the principal manufactures are hats and coverlets.

Charolles was formerly the chief town in the small province of Charollais;^b it is at present the capital of a district^c which possesses several manufactories and five or six iron works. Bourbon-Lancy contains two thousand five hundred individuals; it is still frequented on account of its mineral waters; the baths were constructed by the Romans;^d the town bears the name of *Aqua Misine*^e in the Theodosian table. It is unnecessary to go out of the road to examine Louhans^f on the left bank of the Seille, for it consists only of some old houses that project into the streets.^g Chalons sur Saone^h rivals Macon in commerce and industry.ⁱ An old bridge that leads to the suburbs^k may recal an act of cruelty committed by Lothaire; that prince in order to satisfy the hatred he bore the sons of the count of Toulouse, ordered their sister, the fair and virtuous Gerberge, to be dragged at a horse's tail^l along the bridge, and afterwards to be put into a cask, and thrown into the Saone. The town is well built, a fine quay has been constructed along the river, and a lofty obelisk serves to adorn a public walk. Chalons was an important military station in the time of Cæsar, by whom it is called *Cabitolium*,^m but as Danville remarks, there are few places in France, of which the ancient name has been written in so many different ways.ⁿ Denon was a native of Chalons.

The small town of Montcenis rises on a hill between two mountains at some distance to the west of the Central Canal;^o coal and iron mines are worked in the neighbourhood. The burgh of Creusot is a place of considerable trade; it exports glass and crystal to most parts of France; it has its cannon founderies and iron works.^p Autun rises at the confluence of the Arroux and the Creusevaux; it was the *Bibracte* of the *Ædui*, but it received the name of *Augustodunum* during the empire. Triumphal arches, the ruins of temples and amphitheatres, and the extent of the old walls, attest that it was much larger and without doubt much more populous in ancient times than at present. It stands on an

^l "—by the hair (*per les cheveux*)."—

^m This is probably a mistake. The word is twice used in Cæsar's Commentaries (Lib. VII. § 40, *ex oppido Cabillono*; § 83, *Cabiloni et Maticone*.) in which it is written *Cabillonum* and *Cabilonum* in several different copies referred to, including the Elzevir edition 1635, *ex emendatione Jos. Scaligeri*. It is written *Cabillonum* in D'Anville, Moreri, Encyc. Meth. (Geog. Anc.) and Vosgien. The translator has altered the original to *Cabitolium*.—P.

ⁿ Ptolemy calls it *Caballinum*; Strabo, *Cabylinum*; and Ammianus Marcellinus, *Cabillo* in the Itinerary of Antonine, it is called *Cabel-*

eminence above an ancient *Campus Martius*, which has been transformed into a fine walk shaded with trees.¹

The nature of the country has pointed out two different occupations to the people in the department of the Cote d'Or;² the one consists in cultivating the ground, and the other in working metals.³ With more roads than the average number in other departments, it is comparatively thinly peopled; but it may be urged that the occupations in which the inhabitants are engaged do not require so many hands as other branches of industry. If the vineyards be excepted, the country is not well cultivated; under better management, a number of oxen and sheep sufficient for the consumption might easily be reared.⁴ The course of the Ouche divides the department into two distinct regions; the one on the south, through which the small chain of the Cote d'Or extends, is admirably adapted for the culture of the vine, while the one on the north, which includes part of the plateau of Langres, may be styled the region of iron, where Vulcan seems to reign.

To judge of the richness of the southern region, it is only necessary to travel the road which leads from Chalons sur Saone to Beaune and Dijon. The burgh of Nolay, situated not far from Beaune, and the birthplace of the celebrated Carnot, is encompassed with the vineyards of Mont-Rachet.⁵ The different growths of Meursault rival each other, while Pomard and Volnay⁶ are equally famous for their light wines. The vineyards of Richebourg, Romanée and Clos-Vougeot⁷ encircle the small but picturesque town of Nuits. Beaune is situated in the middle of the same rich country, and its successive embellishments may be attributed to an improving trade. The most remarkable edifice in the town, is the hospital founded in 1443 by Rollin, chancellor to Philip, duke of Burgundy.⁸ It is well known that the same chancellor imposed very heavy taxes on the people; "as he has reduced many to poverty," said Louis the Eleventh, "he is right to build a house for them."⁹ Monge, the philosopher, and one of the founders of the Polytechnic school, is one of the few great men that Beaune has produced. The vineyards in the adjoining territory extend on the right of the Saone to the small town of Jean de Losne,¹⁰ a place of sixteen hundred inhabitants, and one that holds no mean

lio; in the Imperial Tables,¹¹ *Caballodunum*; and in the Table of Peutingier, *Cabilio*.

celebrity in the military annals of France. It was besieged in the year 1636 by the grand duke Galeas^a at the head of sixty thousand men; it was defended by eight pieces of cannon, fifty soldiers^b and four hundred inhabitants, determined to die rather than to surrender; among the latter were Peter Desgranges and Peter Lapre, two magistrates whose admirable example was imitated by the citizens. The town supported two assaults, during which the women fought at the side of their brothers and husbands. A fall of rain that lasted twelve hours, afforded the besieged some respite from continued labour; in that interval they resolved to spring their houses and to perish in the ruins; but on the ninth day the imperial army, daunted by their heroic efforts, raised the siege.^c A few hours afterwards, a body of French troops came to the assistance of the town. Louis the Thirteenth offered titles of nobility as a reward for so great heroism, but the inhabitants had the spirit and good sense to refuse them.

The vineyards in the neighbourhood of Beaune meet others near Dijon; the different growths of Brochon, Chenove, Beze and Chambertin near Gevray,^d are so well known that the reader may form some notion of these villages from the commercial importance of their products. Dijon stands in the middle of a pleasant and fruitful plain, terminated by verdant hills. The streets are broad and straight, and the houses are large and well built; the Ouche and the Suzon meet in the town,^e and the ramparts that surround it, are shaded by lofty trees. A Gothic castle built by Louis the Eleventh, and flanked with massive towers, is all that remains of the ancient fortifications. The front of the ancient palace that belonged to the dukes of Burgundy, adorns the Royal square,^f the finest of the fifteen squares in Dijon. In the same edifice are contained a library of forty thousand volumes, together with valuable collections of paintings, statues, antiquities and natural history;^g the old tower that surmounts it, serves as an observatory. The cathedral is a Gothic building, of which the boldness cannot be too much admired; the portal of St. Michael may be mentioned as a specimen of finished workmanship; while the church of St. Benigne is surmounted by a steeple,^h three hundred and seventy-five feet in height. The park, a public walk, communicates with the town by a road or avenue formed by four rows of trees. Science and literature have been long cultivated and honoured at Dijon; in proof of this assertion, it is hardly necessary to mention the college, the schools of philosophy, law and medicine,ⁱ or the names of Bossuet, Crebillon, Piron, Freret, Rameau, Saumaise, Daubenton

ⁿ "It possesses a furnace, which is employed in casting wheels for machinery."

^o Montbar.

^p "Arrondissement."

^q "Its castle contains several manufacturing establishments (*éta blissemens d'industrie*)." ^r Department of the Yonne. ^s "Wheat and oats"

Department of the Yonne.^r Dijon was founded before the Roman conquest; it was then called *Dibio*; Marcus Aurelius was the first who encompassed it with walls and thirty-three towers. Gregory of Tours informs us that the emperor Aurelian adorned it with temples, and rendered it an important fortress; much about the same period, it was known by the name of *Divio*.

If there are other important places in the same department, it may be attributed not to vineyards and wine presses, but to forests, forges and iron works. The town of Auxonne consists of well built streets, and is surrounded by ramparts forming pleasant walks; it has a fine bridge across the Saône, bounded on one side by a stone embankment two thousand four hundred yards in length, a work which was completed in the year 1505 to defend the town against the inundations of the river;^l ^m it contains besides an arsenal and a royal foundry. Fontaine-Française, a populous and wealthy burgh, may be mentioned on account of a monument which was erected to commemorate the victory that Henry the Fourth gained over the duke of Mayenne and the Spanish troops; it possesses several furnaces, and exports wheels for machinery.ⁿ

Saulieu, a town of three thousand inhabitants, and the birthplace of the celebrated Vauban, is situated on the west of the canal of Burgundy; it carries on a considerable trade in fire-wood and in timber. The Armançon flows below the neat and small town of Semur en Auxois, which is built on the summit of a granite rock. Montbard,^o a town of 2000 inhabitants, rises like an amphitheatre above the canal of Burgundy; it is commanded by the castle where Buffon was born; the forges and furnaces that were erected by the great naturalist may be seen in the neighbourhood. There are not many iron works in the district^p of Semur, but there are more than thirty in that of Chatillon sur Seine. The town from which the last district^p takes its name, was an important stronghold during the twelfth century; it was the scene in 1814 of the fruitless negotiations between Napoleon and the allied powers. Different articles are now manufactured within its ancient castle.^q

The department watered by the Yonne^r is less populous than the last, but it produces more grain^s than the inhabitants consume. The woods and forests cover a great extent of surface; the vineyards are not only valuable from the quality of their produce, but they yield nearly twice as much wine as those of the Cote d'Or. Agriculture, however, has not attained the requisite degree of perfection, for in proportion to the surface, fewer oxen and sheep are reared

than the last, but it produces more grain^s than the inhabitants consume. The woods and forests cover a great extent of surface; the vineyards are not only valuable from the quality of their produce, but they yield nearly twice as much wine as those of the Cote d'Or. Agriculture, however, has not attained the requisite degree of perfection, for in proportion to the surface, fewer oxen and sheep are reared

than in the rest of France; indeed if it were not for the number of roads and navigable rivers, which enable the inhabitants to carry on their commerce, it would be one of the poorest departments in the kingdom, notwithstanding its fertility.

In a district^a situated on the right of the road that passes through the principal towns in the department, are united the romantic beauties of Switzerland, and the fertility which characterizes the vineyards of Burgundy. Avallon,^b the chief town in the district,^a is mentioned by the name of *Aballo*, in the Itinerary of Antonine, and as an important fortress, in the capitularies of the French kings. It is known, however, that it was besieged and taken in the year 931 by Emma, the wife of king Raoul. Seventy-four years afterwards, king Robert, coveting the fair country of Burgundy, made himself master of the town; but no sooner had his son Henry the First ascended the throne, than it was taken from him by his brother Robert who retained it with the title of duke.^c The houses are well built, and the situation is very romantic; the walk called the *Petit Cours*,^d owes its chief charm to its position above the steep banks of the Cousin, a small river that winds through a deep and sequestered valley, partly enclosed by precipitous rocks, towering above verdant woods or gardens that seem to hang in the air; in another direction the same valley leads to fruitful fields and extensive forests.^e

The town of Vermanton contains about three thousand inhabitants; it carries on a trade in wine and timber; on the road that leads to it, and at no great distance above the village of Arcy sur Cure, are situated the extensive grottos which were formerly considered the greatest natural curiosities in the province. They consist of a great many halls that communicate with each other by narrow passages, so low in some places that it is necessary to stoop^f in order to pass through them; one of them encloses a small lake of which the depth has never been measured. All of them are lined with stalactites, which have the appearance of festoons, immovable cascades, organs or colonnades, and which

when lightly struck emit sounds that are several times echoed with different modulations. Beyond the confluence of the Cure and the Yonne, and on the left of the last river, may be seen the hills, which have given to Coulanges the surname of *la Vineuse*.^g Chablis, a town of two thousand five hundred inhabitants, and famous for its white wines, is situated on the right, near the Seray: in the vicinity are the remains of a Roman way which led from Langres to Auxerre.

The vineyards of Ligny le Chatel, Seignelay, Toucy, and other places equally celebrated in the country, surround the former capital of Auxerrois;^h it might be difficult to determine its ancient name with scrupulous accuracy, but antiquaries may choose between *Altissiodorum*, *Autissiodorum* and *Antissiodorum*.ⁱ It is certain, however, that the Romans made it the chief town of a *Pagus* by rendering it independent of *Senones*.^k Some wealthy wine merchants who have become collectors of antiquities, possess medals and coins which were found in the town, and which prove that money was once struck there. It was desolated at different times by the Huns, the Normans, the Saracens and the English, and it was more than once pillaged during the religious wars in the sixteenth century;^l but the courageous resistance of one man preserved it from the crimes and horrors of St. Bartholomew. The inhabitants of Auxerre had been included in the proscribed lists which preceded the massacre; a magistrate, afterwards president Jeannin, whom historians call the *most virtuous minister* of Henry the Fourth, had the glory of saving his native city. Amyot holds the first rank among the learned men that were born in Auxerre;^m it has also given birth to John Duval, an able antiquary, to Royer de Pilles, the author of the lives of the painters,ⁿ to the Abbé Lebœuf, who has left many valuable writings concerning the history of Paris,^o to St. Palaye, known by his memoirs of chivalry,^p to Retif de la Bretonne, whose familiar style is well adapted for the task he undertook—a faithful picture of the burgesses and manners of his day,^q and lastly, to Sedaine, a dramatic writer of an inferior

^a Arrondissement.

^b Avalon.

^c Robert, king of France, nephew of Eudes the last duke of Burgundy of the first race, who died without children in 1001, took possession of the dutchy as his heir, and gave it as an appanage to Robert his third son, first of the dukes of Burgundy of the second race. Robert, king of France, died in 1031, and was succeeded by Henry I. his second son. (Moreri.)—King Robert made himself master of Avallon, after three months' siege, in 1005; his son Robert, afterwards duke of Burgundy, took it in 1031, and kept it with the dutchy. (Encyc. Meth.)—P.

^d Little Corso.

^e "—a small river that winds through a valley a hundred feet in depth, bordered by precipitous declivities, along which pointed rocks rise amidst verdant thickets, and above which gardens seem suspended in the air. The view along this narrow valley is at last terminated by fertile fields and extensive forests."

Auxerre.—No less than thirteen Latin names of the town are enumerated by Moreri.—P.

^k "—by detaching it from the territory of the *Senones* (cité des *Senones*"—*civitas Senonum*.) The Roman provinces consisted of states (*civitates*), which were subdivided into *pagi*. (Omnis civitas Helvetia in quatuor pagos divisa est. Cæsar. Comment. Lib. I. § 10.)—P.

^l "It was disturbed (*troublée*) during the religious wars of the 16th century." The Huguenots pillaged it in 1567. (Moreri.)—P.

^m "It owed to the courageous resistance of president Jeannin its deliverance from the horrible massacre of St. Bartholomew; that magistrate, who became one of the worthiest ministers of Henry IV., could not forget during that horrible proscription, his own native place, and the town that gave birth to Amyot." This sentence, pretty closely rendered from the original, is not very definite, but appears to contain some historical inaccuracies. The president Jeannin, then a simple advocate in the parliament of Dijon, but chosen by the states of Burgundy to manage the affairs of the province, resisted the execution of the orders for the massacre of St. Bartholomew, at Dijon, not at Auxerre. He was a native of Autun, where he was born in 1540. Amyot was a native of Melun, but was appointed bishop of Auxerre, where he died in 1593. Moreri. Beauvais. Dict. Hist. Caen, 1804. Encyc. Meth. Geog. Mod.—P.

ⁿ "—auteur de la *Vie des peintres*"—Roger de Piles, born at Clamecy, 1635; author of several works on painting, among others, of a compendium of the lives of the painters (*Abregé de la Vie des Peintres*.) Beauvais. Dict. Hist.—P.

^o "—author of many writings on the history of the environs of Paris."—Jean Le Beuf, born at Auxerre, 1687. The list of his writings, all on different subjects of French history, amounts to not less than 173. Among them are, Dissertations on the ecclesiastical and civil history of Paris, 3 vols. 12mo., and a History of the city and diocese of Paris, 15 vols. 12mo.—P.

^p J. B. de la Curne de Sainte Palaye, author of a work on the institution and early state of chivalry (*Mémoires sur l'Ancienne Chevalerie*.)—P.

^q "Retif de la Bretonne, an author whose trivial style paints with much fidelity the manners of the lower class of citizens (*la petite bourgeoisie*) during the period in which he wrote."—Retif de la Bretonne, born at the village of Sacy in Burgundy, 1734—died at Paris, 1806—author of numerous works of a light and indelicate character, and at one time the would-be rival of Rousseau. Beauvais.—P.

order, but one who understood at least what has been since termed stage-effect.^a There are many well-built houses in Auxerre, but the cathedral is the only edifice which attracts attention; it is adorned with a magnificent portal and finely painted windows. The marshal of Chastelux,^b after having taken Cravant from the English, restored it in 1423 to the chapter of Auxerre; for this service the chapter granted a canonry in perpetuity to the eldest sons of the Chastelux family. They took possession of it in boots and spurs, armed with a sword, and covered with a surplice, bearing the canonical amice on the left arm, with a hawk perched on the fist, and holding a hat with feathers in the right hand. It happened in the year 1683 that one of the descendants of the family appeared in this singular costume in the cathedral before Louis the Fourteenth and his court, when some of the young nobles could not refrain from smiling; the king reproved them by asking if they would not wish to have such a proof of an ancestor's valour.^c

Joigny was founded about the year 1000; it must have been a wealthy and commercial town less than three hundred years afterwards, for the inhabitants paid a very large sum of money during the thirteenth century to free themselves from the authority of their counts; it rises like an amphitheatre above the banks of the Yonne, and is commanded by an old castle.

Sens is situated on the right bank of the Yonne; the ramparts may be seen from a great distance; there is reason to believe that they were founded before the time^d that Julian maintained in *Agedincum* or *Senones*, a successful siege against the Germans. The same town became the capital of the Fourth Lyonnaise during the reign of Valens; it rose afterwards to greater importance, for Theodosius the Great made it the seat of an archiepiscopal see, of which the prelates styled themselves primates of Gaul and Germany; but the archbishop of Lyons claimed the first part of their pompous title. As the population of Sens has been long almost stationary, it may be inferred that industry has made little progress. In the year 1788, the number of inhabitants amounted to 7000; at present it does not exceed 9000.^e Several councils have met at Sens, of which the most celebrated is the one which was held about the beginning of the year 1140; it was there that St. Bernard, influenced by personal hatred, brought about the condemnation of Abeilard, but that celebrated theologian, not supposing his tenets *dammable*, appealed to the pope. The cathedral has an imposing effect; it occupies the centre of the finest square in the town. The mausoleum of the Dauphiness and of the Dauphin, father of Louis the Sixteenth, Louis the Eighteenth, and Charles the Tenth, has been restored since the return of the

Bourbon family; it consists of many allegorical figures, the work of Coustou the sculptor. A basso-relievo behind the choir, represents the martyrdom of St. Savinian, the first bishop of Sens. The painted windows attest the genius of John Cousin, one of the earliest French painters and a native of Soucy, a village in the neighbourhood. There are not more than six thousand volumes in the public library; one of the manuscripts, which has been removed to the town-house, is a folio containing the *Officia Stultorum*, as they were formerly celebrated in the cathedral of Sens,^f and also a poetical panegyric of the Ass,^g which used to be repeated or chaunted in some of the churches. The binding of the manuscript is studded with ivory figures representing different subjects connected with the sacred bacchanals of an ignorant and corrupt age, which some have been pleased to style *the good old time*.

The festival of fools held the first rank among those in which sacred, profane and obscene exhibitions were united. It was celebrated about the beginning of the year, in some places on the day of the Circumcision,^h and in others on the day of the Innocents.ⁱ Priests, deacons and choristers elected a bishop or pope for the occasion, who appeared with the pontifical robes and the mitre, followed by a number of ecclesiastics, clad as kings, princes and dukes; there were besides many individuals in various disguises, some as women, and others as different animals, or representing Bacchus, satyrs and heathen divinities. To this motley group his holiness pronounced the benediction; the priests then danced round the choir, assisted in leading an ass covered with a magnificent cope, sung the eulogy of the same animal, and obscene songs, to which all the people brayed by way of response. While the pope or bishop was offering prayers at the altar, the other persons in the church sat down to a feast, got drunk, played at dice, burnt old leather in the censers, and committed every sort of impiety. The songs which were sung on these occasions, have been attributed to Peter De Corbeil, an archbishop of Sens, who died about the beginning of the thirteenth century. The cathedral has not been stained with these pollutions since the year 1530.^k The festival of fools, however, was not the only one of the kind; others of a similar nature were celebrated on the anniversaries of St. Stephen and St. John the Evangelist.^l

Tonnerre is situated on the left of the canal of Burgundy and of the Armançon, a feeder of the Yonne; antiquaries consider it a very ancient town, indeed it is not improbable that it was inhabited long before the Roman invasion.^m The houses are well built, and the neighbouring country is famous for vineyards, of which the wines are exported to most parts of Europe. A spring issues from

^a "Sedaine, a dramatic writer, who had no other merit than his knowledge of stage effect"—M. J. Sedaine, born in Paris 1719, son of an architect, and himself originally a stone cutter. He first wrote for the Comic Opera, to which he gave a great vogue, and then for the Italian Opera and the *Theatre Française*. His dramatic pieces amount to 32 in number, some of which had a very great currency (—one of them (the Deserter) was repeated a hundred times;) they show a perfect knowledge of stage effect, but the language, although easy and natural, is full of inaccuracies. Dict. Hist. Caen. 1804.—P.

^b Claude de Beauvoir, marshal of Chastellux (Chastelus. Moreri).—P.

^c "There is not one of you, said the king, who would not, for the same price, be ambitious of such a privilege"—i. e. who would not consider the canonry worth the oddity of the installation.—P.

^m "It is supposed to have been founded in the time of the Romans."

a rock in one of its suburbs, the waters of which are so copious as to turn several mills a short distance from their source. Tonnerre possesses a college and a school of some celebrity, in which lectures are delivered on the application of geometry to the arts.^a It was the birthplace of Chevalier D'Eon de Beaumont, a person who rendered important services to his country, both as a diplomatist and a general.

It is necessary to pass through part of the country which has been described, and to cross the Upper Saone, in order to examine the frontier departments in Franche-Comté and Alsace. Before proceeding to the latter, the department of the Upper Saone requires a brief description. The heights and vallies between the Saone and Oignon extend in the direction of those two rivers. Vineyards which produce only weak and ordinary wines, are situated nearer the banks of the second than the first; they cover a fortieth part of the whole surface: the woods and forests in different parts of the country occupy about a third part, arable lands rather less than a half, meadows not more than a tenth, and waste lands nearly a fifteenth part of the whole. Although agriculture has made great progress within the last twenty-five years, it is not unreasonable to expect from the fertility of the soil, and from the number and extent of the roads in the department, that additional and important improvements in the same branch of industry may ere long be carried into effect. A great quantity of grain, however, is at present exported to the south, and the culture of the potato has become general; many oxen are reared, but sheep have been so much neglected, that the total number does not exceed forty-five thousand, or in other words, there is not more than one sheep for sixteen inhabitants.^b Coal and iron mines, iron-works, forges and furnaces furnish employment to 3500 individuals. The wages of labourers, overseers, and other expenses connected with these works, give rise to a circulation of L.400,000;^c the neat profit derived from the same source exceeds L.33,000.^d The wealth of the department may therefore be said to consist in its agriculture, in the works already mentioned, in the products of distilleries and different manufactories.^e

The district^f of Lure, the most industrious of the three into which the department has been divided, is situated at the western extremity. The burgh of Hericourt exports cotton stuffs,^g and Vylès-Lure possesses a muslin manufactory, in which nearly five hundred workmen are employed. St. Bresson has been noted for its paper since the year 1660; it supplies the Parisians with the finest vellum paper that is sold in the capital.^h The value of

^k "Hardware (*quincaillerie*)."

^l "A manufactory of tinned iron at the village of Magnoncourt"—

^m *Lixovium*, D'Anv. Encyc. Meth. Geog. Anc.—P.

ⁿ The inscription was discovered on the 23d of July 1755, among

the *kirschwasser*, which the people of Fougerolles send to the same place, varies from fifteen to twenty thousand pounds.ⁱ St. Loup, a town of two thousand inhabitants, is situated on the right bank of the Angrone; it carries on a trade in straw hats, woollen stuffs, horse-combs and bird-lime. Different articles of cutlery^k are manufactured in Plancher les Mines, which derives its name from a mine of argentiferous lead that is still worked. The white iron works near the village of Magnoncourt^l afford constant employment to more than two hundred and fifty workmen. Few other places of any consequence can be mentioned in the same part of the country; it may be remarked, however, that good hones are exported from Faucogney and Champagney, and that granite quarries might be worked with profit near Melisey and Chateau-Lambert, the latter a village well known for its excellent cheese.

The ancient town of Luxeuil or Luxeu stands in a fine situation on the confines of a large and fruitful plain, watered by the Brouchin and the Lanterne, two rapid rivers abounding in fish; hills covered with lofty woods rise at no great distance from the town. The present name appears to have been derived from *Lug* and *Sui*, two Celtic words which signify warm water; it is certain, however, that the place was called *Lixovium*^m by the Romans. It appears from an inscription, that the baths were repaired by Labienus in conformity to the orders of Cæsar;ⁿ the most of them are now in ruins, but the ruins are not unworthy of the ancients; so long as the waters were held in repute, the inhabitants spared no expense to render the town agreeable to strangers.^o Lure, which is also considered a place of great antiquity, was formerly celebrated for an abbey, founded by St. Deicole in the reign of Clotaire the Second. The chief of the monastery, which afterwards adopted the rule of St. Benedict, took the title of prince of the Holy Empire;^p the building which he occupied serves at present as a residence to the subprefect.

According to the learned dissertations of certain antiquaries whose labour in illustrating the language and manners of the Celts, merited better success, the name of Vesoul comes from two Celtic words, *ves*, tomb, and *houl*, sun; by a process of reasoning as ingenious as it is hypothetical, it has been discovered that the tomb of the sun was connected with an important part of the druidical worship. If the etymology be correct, the town must have existed at a very remote period; it happens unfortunately, however, that it was unknown to the ancients.^q No notice of it can be found in the history of France before the tenth century, and it is only mentioned as the theatre of two important events in the annals of Franche Comté. About

the ruins of the ancient *thermæ*, and is now preserved in the town-house. *LIXOVII THERM. REPAR. LABIENUS JUSS. C. JUL. COES. IMP.*

^o "Those which exist are worthy the magnificence of the ancients. In the watering season, the inhabitants spare no pains to render their town agreeable to strangers." Luxeuil is, in fact, and long has been, a noted watering place—It has five baths, viz. the Benedictines' bath, the Ladies' bath, the Great bath, the Little bath or Poor's bath, and the Capuchins' bath. Encyc. Meth. 1784.—P.

^p The abbot of Lure (Lat. *Luthra, Ludera*; Germ. *Ludders*) has the title of prince of the empire. Encyc. Meth. 1784.—P.

^q "According to the learned dissertations of the antiquaries who investigate the language and antiquities of the Celts, in order to discover the etymologies of the names of our ancient towns, that of Vesoul comes from two Celtic words, namely, *rez*, tomb, and *houl*, sun; this appellation (*tomb of the sun*) is also considered by them a precious relic of the druidical worship. According to the above etymology, the town must have existed at the remotest period of antiquity; it does not appear, however, to have been known to the ancients."

the middle of the sixteenth century, a German army returning destitute of provisions and money from an expedition against Bresse, resolved to plunder Vesoul. The general had called a council of war, in which it was agreed that an attempt should be made to scale the walls, but after a fall of rain that lasted twenty-four hours, the plain was covered with water, and the terrified Germans attributing the phenomenon to an interposition of providence, fled from Vesoul, leaving behind them their baggage and artillery.^a The flight of the Germans was occasioned by a natural cause, and the waters of Frais-Puits^b had the merit of saving the town. The bed of a torrent may be observed about the distance of a league from Vesoul; the same bed remains dry the greater part of the year, and the ravine through which it extends, terminates in a gulf not less than fifty feet in depth by sixty in diameter; it too in ordinary seasons is almost dry, but after heavy rains a great quantity of water is suddenly discharged from it, which inundates the neighbouring meadows, reaching even to the lower part of the town, and changes into a sort of lake the country inclined towards the Saone. This phenomenon continues sometimes for three days, after which the waters retire, the gulf empties itself, and the torrent ceases to flow.^c The siege, that has been mentioned, was by no means creditable to the baron of Polwillers, who ought to have respected a neutral territory, but in the same annals the name of Turenne is associated with an act of bad faith. No sooner had that hero presented himself in 1644 before the gates of the town than it surrendered; the conditions of the capitulation were hardly signed, before it was given up to pillage; the convent of the Annunciates,^d where the inhabitants believed their wives, children and most precious effects to be safe, was not considered inviolable; the town-house was demolished and the archives were destroyed. It is added that it was necessary to pledge the sacred vessels and to sell many valuable articles,^e in order to pay the contributions, and redeem the hostages.

Industry and wealth have been diffused over Franche-Comté since it was united to France in the year 1678. Vesoul since the same period has been enlarged and embellished; the principal church, which may be remarked for the beauty of its altar, and also on account of an ancient sepulchre, was finished in 1745, the present town-house in 1766, the courts of justice^f in 1770, the market in 1772, the new walk in 1774, the barracks in 1777, and the prefect's palace in 1822. The public library has been placed in one of the halls of the college, it consists of more than twenty-one thousand volumes; in an adjoining apartment is a collection of natural history, to which valuable additions have lately been made.^g

^a "Preparations were made to scale the walls, when a rain of twenty-four hours' duration having covered the plain with water, the terrified Germans, attributing this sudden inundation to the sluices which the inhabitants had opened for their defence, fled from the town, leaving behind them their artillery and baggage."¹

^h "It employs annually in transporting its merchandise by land and by water, 86,500 horses."

Several places not unworthy of notice are situated in the neighbourhood of Vesoul. The grottos of Echenos les Molines, at a short distance from the walls, are remarkable for their extent; they also contain many bones of animals now extinct. The foundations of vast edifices, traces of ancient ditches, and the remains of the Roman ways, that have been discovered near Jussey, a town of two thousand six hundred inhabitants, serve to strengthen the tradition that it was built by a Roman colony in the third century. Corre is probably situated on the ruins of *Didatium*, a Gallic city; statues, basso-relievos and medals are found in this humble village, the only remains of an important town.

Gray rises like an amphitheatre above the banks of the Saone; it contained before the revolution, not fewer than eight convents; it carries on at present a great trade in grain, flour and iron. The number of horses employed in conveying the goods by land, and in dragging them along rivers, amounts nearly to 80,000.^h In one work, equal perhaps to any other of the same sort in Europe, are saw and oil mills, mills for tanning leather, and felting cloth, and also a mill in which twenty-four thousand and sixty-six quarters of corn are annually ground.ⁱ The streets are steep and crooked; the town is commanded by an old castle, which was inhabited by Philip the Bold, John the Fearless,^k Philip the Good, and Catharine of Burgundy, the widow of Leopold of Austria.

The lofty summits of Jura form part of the French territory; the chain has given its name to a very industrious department,^l richer perhaps in cattle than any other, abounding in woods, but ill provided with navigable rivers.^m The eastern part is the most mountainous; it may be said to consist of three ridges:ⁿ the highest, contiguous to Switzerland, is covered with snow six months in the year; the soil is comparatively sterile, but the inhabitants are laborious: in the second, fir trees, box and juniper bushes predominate, but there are besides some rich pastures and fertile valleys;^o the third, less elevated than the two others, is also less unfruitful. At the foot of these ridges, in which mines of iron, quarries of marble and saline deposits^p are worked, low hills covered with vineyards that yield good wine, occupy a surface twenty leagues in length; lastly, plains consisting chiefly of arable land form the base or arena of this natural amphitheatre.

The northern part of the plain is traversed by the Doubs, and extends below the forest of Chaux, a forest that covers several hills and a surface of 50,000 acres.^q Dole^r is situated on the banks of the river, at the foot of a hill^s planted with vineyards. The vast forest near the town, the Doubs and the canal of Monsieur, which bathe the walls and fertil-

ize the fields, the Loue,^a the Cuisanee and the Glantine, that wind at a distance, the curtain formed by the mountains from which the three latter rivers take their source, and the double summit of Mont-Blanc, the most distant object in the picture, are all seen from the *Cours* or highest part of Dole.^b The town might be much improved if the streets were better paved, if the houses were more regular; according to the expression of a flowery writer,^c "it might then look like a nymph in the middle of a grove;" at present, however, it has certainly the appearance of a faded belle. It is very doubtful that Dole was ever a place of much importance; antiquaries may affirm the contrary, but it does not follow from a few medals, some remains of pilasters, some traces of Roman ways, or even from the ruins of an amphitheatre, that the town stands on the site of *Didatium*, besides it might be shown that *Didatium* was an inconsiderable city, although mention is made of it in the geography of Ptolemy.^d The antiquity of Dole may be very probable, but it ought not to be forgotten that no traces of its ancient name have hitherto been discovered, and also that the surrounding country is well adapted for antiquarian research, since there is hardly a village that does not possess a monument of the Celts or Romans.^e Several charitable institutions, a prison that is said to be too elegant and too commodious,^f two or three manufactories,^g public walks and romantic views may enable the reader to form some notion of its edifices, position and industry.

To prove the antiquity of Poligny,^h it has been said that it derives its name from *Polis Solis*, the city of the sun;ⁱ This important discovery and many others of the like kind, made by the antiquaries of Franche-Comté, may be the results of a creative imagination, certainly not of patient research.^k The position of *Castrum-Olinum*, as it is indicated in different itineraries, accords with that of Poligny.^l Although at present merely the residence of a subprefect, it was inhabited in the time of the Romans by the lieutenant of the Great Sequanaise, and it became under the dukes of Burgundy, the summer residence of those princes; it rose then on the height which now commands it. The houses

(Enc. Meth. Geog. Mod. art. Poligny.)—P.

^m "The canon Jean Molinet, who made a prose translation of the poem of the Rose." J. Molinet, a French poet of the fifteenth century, born at Desureennes, a village in the diocese of Boulogne in Picardy, was almoner and librarian to Margaret of Austria and canon of the

cathedral of Valenciennes, where he died, 1507. He made a prose translation of the Romance of the Rose by Jean de Meung, and was the author of many other works, both in prose and verse, among others of a chronicle of the Low Countries. (Beauvais. Nouv. Dict. Hist. Caen, 1804.)—P.

ⁿ "First president of the court of exchequer (*cour des comptes*)."—Jacques Coytier or Coetier (chancellor of Louis XI.) Dict. Hist. Caen, 1804.—J. Coythier. Beauvais.—J. Coytier or Cottier. Moreri.—In allusion to the last orthography, after he was driven from the court, he placed over the gate of his residence in Paris, an apricot tree (*abricottier*.) with the motto "*a l'abri Cottier*," Cottier in security.—P.

^o 12 o'clock P. M. Christmas Eve.—P.

^p "The neighbourhood of Poligny is rich in ancient monuments: two druidical stones are still held in veneration by the peasantry, who believe that they turn round on themselves, every year, at the moment of the midnight mass; vast Roman constructions, the design of which is unknown, and which the people call the *Chambrettes* (little chambers,) because the traces of a great number of apartments may be still distinguished, promise to repay the trouble of excavation, if we may judge from a specimen of mosaic, which the Count de Caylus regarded as one of the finest of the kind, but which is now concealed under several feet of earth, in the midst of a cultivated field."
